THE ENCYCLOPEDIA AMERICANA

Ar^oma^tic Vinegar, a liquid consisting of strong acetic acid, and obtained by distilling crystallized diacetate of copper. Its aroma is due to the presence of *acetone*, but it is also usually highly flavored with preparations, such as cloves, calamus, etc. It has a pleasant perfume, and its vapor, when inhaled, has a powerful effect on the nostrils, and acts as a strong excitant on the whole system. The liquid is highly corrosive.

Arona, a-rō'na, Italy, an ancient town near the southern extremity of Lago Maggiore. In the vicinity is the colossal statue of San Carlo Borromeo, 70 feet high, exclusive of the pedestal, 42 feet high. There are silk, cotton, and metal works here. Pop. (1901) 4,700.

Aroo. See ARRU ISLANDS.

Aroostook, a-roos'tuk, a river in Maine. It rises in Piscataquis County, Me.; flows more than 120 miles in a circuitous course, and enters the St. John River in New Brunswick. It was an important factor in the settlement of the long-pending dispute concerning the boundary between the United States and British America.

Arouet, a'roo-ā'. See VOLTAIRE.

Around the World in Eighty Days, a noted romance by Jules Verne. Phileas Fogg, an English gentleman, wagers that a man can travel around the world in 80 days. He wins his wager, after a series of exciting adventures.

Arpad, ār'pád, the conqueror of Hungary, and founder of the Arpad dynasty, which reigned till 1301. He was born in the second half of the 9th century; died in 907. He was the son of Almus, whom the seven Magyar clans dwelling in the steppes northeast of the Caspian Sea had elected their hereditary chief about 880. Thus united into one nation, the Magyars, mustering about 25,000 warriors, crossed the Carpathians and conquered Hungary, when Arpad was elected their prince.

Arpeggio, ār-pěj'ō (Italian, from *arpa*, a harp), in music, the playing of a chord on a keyed or stringed instrument by sounding the notes, not together, but in rapid succession.

Vol. 2—1

Arpent, ar'pan', an ancient French land measure, ordinarily equal to five sixths of an English acre; but it varied in different parts of France.

Arpino, ār-pē'nō (ancient *Arpinum*), a town of southern Italy, celebrated as the birthplace of Caius Marius and Cicero. It is situated on a rising ground near the river Garigliano, was originally founded by the Volsci, and became a municipal town under the Romans. It is still a place of some importance, possesses a royal college and several churches, and manufactures woolens. Pop. (1900) 10,607.

Arqua, ār-kwā', a village of northern Italy, about 13 miles southwest of Padua. Here was the home of the poet Petrarch. A monument has been erected over his grave in front of the church. Pop. about 500.

Arquebus, ār'kwe-būs, an ancient species of firearm resembling a musket. It was fired from a forked rest, and sometimes cocked by a wheel, and carried a ball that weighed nearly two ounces. A larger kind used in fortresses carried a heavier shot. See ORDNANCE.

Arracacha, ār'ra-kā'cha, or **Aracacha**, a genus of umbelliferous plants of Southern and Central America. The root of *A. esculenta* is divided into several lobes, each of which is about the size of a large carrot. These are boiled like potatoes and largely eaten in South America.

Ar'rack, or **Rack**, a name applied by Orientals to a strong spirituous liquor distilled from rice, from the juice of the cocoanut, date, and other palms, or from molasses. The arrack of Goa and Colombo in Ceylon is distilled from palm-juice alone, after being allowed to ferment; that of Batavia and Jamaica from rice and molasses. The rice is turned into malt by being soaked in water and allowed to sprout, after which the arrack is distilled from it on fermentation taking place in the same way as whiskey from barley-malt. The rice is also often used without being malted. The distillation of the fermented liquor affords the third or worst sort of arrack; this mixed with a little water and

ARRAGONITE — ARREST OF JUDGMENT

again distilled gives the second best sort; a third distillation produces the best sort, which is seldom exported. The arrack sold in Europe is seldom genuine. Pure arrack is clear and transparent, with a yellowish or straw color, and a peculiar but agreeable taste and smell; it contains at least 52 to 54 per cent of alcohol. Not much of it is imported into England, but it is largely drunk in India and the East generally, the Indian and Pacific Islands, Africa, and South America. The arrack of Japan is known as *saki*.

Arragonite, a common but erroneous spelling for the mineral *Aragonite* (q.v.).

Ar'rah, a town of British India, in Bengal. The surrounding country is fertile and well cultivated, and near the town is a large and beautiful lake. It was rendered famous during the mutiny of 1857 by the heroic resistance of a body of 20 civilians and 50 Sikhs, cooped up within a detached house, to a force of 3,000 sepoys, who were ultimately routed and overthrown by the arrival of a small European reinforcement. Pop. 47,000.

Arrah Na Pogue, ar-*rā* na pōg, a play by Dion Boucicault. (q.v.).

Arraign'ment, in the practice of criminal law the calling of a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. His innocence being presumed, it is the law, and is so laid down in the most ancient books, that, though charged upon an indictment of the gravest nature, he is entitled to stand at the bar in the character of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands.

Arran, ār'ān, an island of Scotland, in the Firth of Clyde, 20 miles long, and 10 miles wide, with an area of 165 square miles. The island attains its loftiest summit in Goatfell, which is 2,900 feet high. The southern portion is rather hilly than mountainous, and contains several arable tracts of considerable extent and tolerable fertility. The geology of Arran has attracted much attention, as furnishing within a comparatively narrow space distinct sections of the great geological formations. The botany possesses almost equal interest, both in the variety and the rarity of many of its plants. Among objects of historical interest are the cave of Drumdoon, relics of Danish forts, and Druidical stones. Pop. (1900) 6,000. Consult 'A May Week in Arran' (1882).

Arras, ār'ras', a town of France, capital of the department of Pas-de-Calais, in the middle of an extensive and fertile plain, on the Scarpe, which here becomes navigable. It is a well-built town, and has several handsome squares and a citadel, but is no longer fortified. The chief public buildings are the modern cathedral, the extensive buildings of the former abbey of St. Vaast, now accommodating a museum and the public library of 50,000 volumes; the Hôtel de Ville, one of the handsomest in the north of France, with a fine Gothic façade; the theatre, Hôtel de la Prefecture, barracks, etc. Its industries are varied and important. In the Middle Ages it was famous for the manufacture of tapestry, to which the English applied the name of the town itself. The corn-market of Arras is the most important in the north of France.

It was the birth-place of Robespierre. Pop. (1900) 26,000.

Arrate y Acosta, ar-ra'tā ē ā-kōs'tā, a Cuban historian: b. Havana, 1697; d. 1766. His history of Cuba entitled 'Llave del Nucoo Mundo y ante mural de las India Occidentales' remained in manuscript until 1830.

Arrawak, ar'ra-wāk. See *ARAWAK*.

Arrebo, ar-rē-bō, **Anders Christensen**, a Danish poet. b. Arooskjøbing, 1587; d. 1637. He was made Bishop of Drontheim, Norway, when only 31, but deposed in 1622, owing to his objectionable life; he was afterward rehabilitated as preacher in Vordingborg. As the pioneer of the Renaissance movement, he is considered the father of modern poetry in Denmark. His rhymed translation of the 'Psalms of David' (1623), but especially his 'Hexameron' (1641), an imitation of a once famous poem of the French poet Du Bartas on the 'Creation,' are highly esteemed.

Arrest, the seizure of a suspected criminal or delinquent that security may be taken for his appearance at the proper time before a court to answer to a charge. Ordinarily, a person can be arrested only by a warrant from a justice of the peace; but there are exceptional cases in which he can be apprehended by an officer without a warrant, by a private person also without a warrant, or by what is technically called a "hue and cry."

Any peace officer, as a justice of the peace, sheriff, coroner, or watchman may, without a warrant, arrest any one committing a felony in his presence, 3 Hawkins Pl. Cr. 164, *Tiner v. State*, 44 Tex. 128; *Reg. v. Chapman*, 12 Cox. C. C. 4, or committing a breach of the peace, during its continuance, 3 Wend. N. Y. 384, or even to prevent the commission of a breach of the peace, *Rex v. Herns*, 7 C. & P. 312, 32 E. C. L. 522, and such officer may arrest anyone whom he reasonably suspects of having committed a felony, whether a felony has actually been committed or not. 40 N. Y. 463; 25 Abb. N. C. 298; 3 Park Cr. N. Y. 249; 99 Pa. St. 63.

A private person who is present when a felony is committed, 3 Wend. N. Y. 353; 1 Mood. 93; or during the commission of a breach of the peace, 10 Cl. & Fin. Hon. L. 28; 25 Vt. 261, may and should arrest the felon, and may upon reasonable suspicion that the person arrested is the felon, if a felony has been committed 3 Wend. N. Y. 353; 6 Term 315.

An arrest is made by touching the body of the person accused. The object of arrest being to make sure that he answers to a charge about to be brought against him, it does not follow that after being seized he is incarcerated; if bail for his appearance at the proper time be given, and the case be not too aggravated a one for such security to be accepted, he will be released till the day of trial.

Arrest of Judgment, in law, is the act or process of preventing a judgment or verdict from being carried out till it shall be ascertained whether it is faulty or legally correct. Judgment may be arrested (1) when the declaration made varies from the original writ; (2) where the verdict materially differs from the pleadings and issue thereon; and (3) where the case laid in the declaration is not sufficient in law to admit of an action being founded upon it. A mo-

ARRHENATHERUM — ARROW-ROOT

tion for arrest of judgment must be grounded on some objection arising on the face of the record itself. *People v. Thompson*, 41 N. Y. 1; *People v. Kelley*, 94 N. Y. 526. If the judgment is arrested all the proceedings are set aside, and judgment of acquittal is given, but this will be no bar to a new indictment.

Ar'henathe'rūm, a genus of three species of tall perennial grasses closely allied to the oat (q.v.). *A. elatius* or *avenaceum* (also known as *Avena elatius* and *Holcus avenaceus*), which, as these names imply, bears a resemblance to oats, and sometimes called oat grass and French rye grass, is widely cultivated for fodder in France. True rye grass (*Lolium*) is, however, not a close relative.

Arrhenius, ar-rā'nī-ūs, **Svante**, a noted Swedish chemist: b. in Upsala in 1850. He was educated at the University of Upsala and after making many original investigations became professor in the University of Stockholm in 1891. His researches have been of the highest importance, the establishment of the theory of electrolytic dissociation being due to him. This theory supplies a reasonable explanation of many chemical phenomena otherwise insoluble and correlates various facts between which no connection has been previously discovered. He has published 'Sur la conductibilité galvanique des électrolytes' (1884), and a treatise in German on electro-chemistry (1902).

Ar'ria, a celebrated Roman matron, wife of Cæcinnæ Pætus, consul during the reign of Claudius, about 41 A.D. Pætus having raised an unsuccessful revolt against Claudius, in Illyria, was condemned to die, but was allowed the option of ending his life by suicide, which the Romans did not deem a crime. Pætus hesitated; Arria seized the dagger, plunged it into her bosom, and then presenting it to her husband, said, "It is not painful, Pætus."

Arriaga, ār're-ā'ga, **Pablo José d'**, a Spanish Jesuit: b. 1562; d. 1622. He was the first rector of the Jesuit College in Lima and wrote a valuable history entitled 'Estirpacion de la Idolatria de los Indos del Peni.'

Arria'nus, a celebrated Greek historian, a native of Nicomedia, in Bithynia, who flourished in the 2d century under the Emperor Hadrian and the Antonines. He was a disciple of Epictetus, whose lectures he edited. While residing in Greece he gained the friendship of the Emperor Hadrian, who bestowed upon him the citizenship of Rome (124 A.D.), and subsequently appointed him prefect of Cappadocia. In this capacity he distinguished himself in the war against the Massagete. He was afterward advanced to the senatorial and even consular dignities. Like Xenophon, whom he imitated in style, he united the literary with the military character. His writings were numerous, but many of them have perished. His 'Anabasis' of Alexander the Great, still extant, narrates the Asiatic expedition of Alexander, and being based on the memoirs of Ptolemy Lagus and Aristobulus, who both served under that king, is deemed proportionably valuable. To this is added a book on the affairs of India, which pursues the history of Alexander, but is not deemed of equal authority. An epistle from Arrianus to Hadrian is also extant, entitled 'Periplus Ponti Euxini' (Periplus of the Euxine or Black Sea). There are also ascribed to him 'Treatise on

Tactics'; and a 'Periplus of the Sea of Azof' and of the Red Sea, of which the authority is doubtful. We possess also his 'Enchiridion,' a moral treatise containing an abstract of the practical philosophy of Epictetus. There have been various editions of the 'Enchiridion' and the 'Anabasis'. His philosophical works have been translated by T. W. Higginson (Boston 1891) and the 'Anabasis' by Chinnock (1893).

Arrondissement, a'rôn-des-mān, a name given in France to the subdivision of a department, or of the quarters of some of the larger cities, as in Paris. The arrondissement is under the government of a *sous-préfet*.

Arroo. See **ARRU**.

Ar'row, a missile weapon, straight, slender, pointed, and barbed, to be shot with a bow. See **ARCHERY**.

Arrowhead, *Sagittaria*, a genus of plants of the natural order *Alismaceæ*, distinguished by unisexual flowers, having three herbaceous sepals and three colored petals, numerous stamens, and numerous carpels, which are compressed, one-seeded, and on a globose receptacle. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world. The common arrowhead (*S. sagittifolia*) is a beautiful plant, a native of England, with arrow-shaped leaves which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid bulbs), dried and powdered, have sometimes been used for food, but have an acrid unpleasant taste. The Chinese arrowhead (*S. sinensis*) is a native of China, and has long been cultivated in that country and Japan for its eatable corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves, and a branched polygonal scape (leafless stem). It is grown in ditches and ponds. It is one of the plants sometimes cultivated in tanks in hothouses.

Ar'row Lake, the name given to an expansion of the Columbia River, in British Columbia, about 95 miles long from north to south. It is often regarded as forming two lakes — the Upper and Lower Arrow.

Ar'row-root, a fine grained starch esteemed for making desserts and invalid foods. It is extracted from the underground parts of various tropical plants, especially of the genus *Maranta* of the natural order *Marantaceæ*. The popular name is said to be derived from the practice of the South American Indians who used the freshly dug rootstocks as an antidote for poisoned arrow-wounds. Probably, however, the derivation is from the Indian word *ara*. The principal species is *Maranta arundinacea*, indigenous to tropical America and cultivated in the West Indies, India and other warm countries. It is a perennial plant about two feet high, has small white flowers and fruits about the size and form of currants. The rootstocks, which often exceed a foot in length and three quarters of an inch in diameter, are yellowish white, jointed and covered with loose scales which must be carefully removed before the extraction of the starch, because they impart their disagreeable flavor if allowed to remain. The process of extraction, which is simple but usually crudely practised, is as follows: The root-

ARROWSMITH — ARSENAL

stocks are dug when a year old, well washed, peeled, beaten to a milky pulp in deep wooden mortars, and well washed to remove the fibrous parts, which are thrown away. The crude starch is next passed through a sieve or a coarse cloth and allowed to stand until the starch has settled, when the water is drawn and the white residue again washed. After again settling, the water is drawn off and the pulp when dried in the sun is reduced to powder. On a large scale arrow-root is manufactured with the aid of specially constructed machinery, but the process is essentially as described. Bermudian arrow-root is considered the best in the market, and next to it is that of Jamaica. The East Indian product is believed to be inferior, perhaps because of adulteration with or substitution of other starches, practices induced by the great demand and the high prices paid for the genuine. Some of these other starches are obtained from closely related plants, among which may be mentioned certain species of the genera *Canna* (q.v.), *Curcuma* (see **TURMERIC**), *Manioc* (see **CASSAVA**), *Tacca* (q.v.) and *Arum*. Potato, corn, rice and wheat starch and fine sago are also sold for arrow-root, but may be identified by microscopical examination; the form and markings of the starch grains differ from those of the arrow-root granules. When dry, arrow-root is odorless, but when damp has a slight smell. Like other carbohydrate foods, it is a source of energy, but since it is deficient in nitrogen compounds it should be mixed with eggs, milk, or other substances rich in nitrogenous materials, to form a well-balanced diet.

The amount of fecula or starch present in the roots of the *Maranta* varies according to age, and runs from 8 per cent, in those of the young plants, to 26 per cent when full grown. The latter stage is reached when the plant is 10 to 12 months old; and the roots then present the following composition in 100 parts.

Starch, fecula, or arrow-root.....	26
Woody fibre.....	6
Albumen.....	1½
Gummy extract, volatile oil, and salts.....	1
Water.....	65½

Arrow-root is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snowball. Through the microscope, the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry farina is quite odorless, but when dissolved in boiling water it has a slight peculiar smell, and swells up into a very perfect jelly. Potato starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. Arrow-root is also sometimes adulterated with rice-starch and with the common starch of wheat-flour.

The starch of the cassava, manihot or manioc is sometimes imported into Europe under the name of Brazilian arrow-root. Potato-starch, carefully prepared, is sometimes sold as English arrow-root; and the farina obtained from the roots of the *Arum maculatum*, as Portland ar-

row-root. Otaheite arrow-root is the starch of *Tacca pinnatifida*. All these, as well as Oswego and Chicago corn-flour—the starch of maize or Indian corn—are so nearly allied to true arrow-root as not to be certainly distinguishable by chemical test; but the forms of the granules differ, so that they can be distinguished by the microscope.

Arrowsmith, Aaron, an English cartographer: b. Winston, 1750; d. 1823. He raised the execution of maps to a perfection it had never before attained. His nephew, John, b. 1790, d. 1873, was no less distinguished in the same field; his 'London Atlas of Universal Geography' may be especially mentioned.

Arroyo, ār-rō'yō, the name of two towns of Spain, in Estremadura. Arroyo del Puerco, about 10 miles west of Cáceres, has a palace of the old dukes of Benevente, and a parish church adorned with some paintings by Morales. Arroyo Molines de Montanches, about 27 miles south-east of Cáceres, is noted as the scene of the defeat of the French, 28 Oct. 1811, by the British under Lord Hill.

Arru (a-roo') **Islands**, a group belonging to the Dutch, situated to the south of western New Guinea, and extending from north to south about 127 miles. They consist of one large island and a number of smaller. They are all low and swampy, but well wooded and tolerably fertile. The natives belong to the Papuan race, and many of them have been converted to Christianity by Dutch missionaries. The chief exports are trepang, tortoise-shell, pearls, mother-of-pearl, and edible birds'-nests, which they exchange for European goods. Agriculture is in a primitive state, but maize, sugar-cane, beans, bananas, etc., are cultivated. Sago is the chief diet, little animal food being eaten. Pop. about 15,000.

Arsaces, ār-sā-sēz, founder of a dynasty of Parthian kings, who, taking their name from him, are called Arsacidae.

Arsamas, ar'sā-mās, a manufacturing town in the Russian government of Nijni-Novgorod, situated on the right bank of the Tiesha, 250 miles east of Moscow. It contains 34 churches, several convents and schools, 19 tanneries, several soap-works, linen factories, etc., and has a considerable trade. Pop. (1901) 12,380.

Ar'senal, a magazine, or place appointed for the making, repairing, keeping, and issuing of ordnance and other appliances required in warfare, whether in the army or navy. Sometimes the name is applied to an establishment where such articles are kept in store only, but the chief arsenals also embrace large factories or workshops. The principal arsenals of the United States are those in Allegheny, Pa.; Augusta, Ga.; Benecia, Cal.; Columbia, Tenn.; Fort Monroe, Va.; Frankford, Pa.; Indianapolis, Ind.; Kennebec, Me.; New York, N. Y.; Rock Island, Ill.; San Antonio, Tex.; Watertown, Mass.; and Watervliet, N. Y. There are also powder depots at St. Louis, Mo., and Dover, N. J.; a noted armory at Springfield, Mass., an ordnance proving ground at Sandy Hook, N. J. The Royal Arsenal, Woolwich, England, which manufactures warlike implements and stores for the army and navy, was formed about 1720. In France, each territorial military district (19 in all, including Algeria) has its own special arse-

ARSENIC

nal or its own depot of war material. There are naval arsenals at the great government dockyards, namely Cherbourg, Brest, Lorient, Rochefort, and Toulon. The chief arsenals of Germany are situated at Spandau, Cologne, and Dantzic, that at the first-mentioned place being the great centre of the military manufactories. The chief Austrian arsenal is the immense establishment at Vienna, which includes gun-factory, laboratory, small-arms and carriage factories, etc. Austria also purchases quantities of her military stores from private manufacturers. Russia has her principal arsenal at St. Petersburg with supplementary arsenals elsewhere. In Italy, Turin is the centre of the military factories.

Ar'senic, an elementary substance, resembling the metals in its physical properties, and formerly classed with them. In its chemical relations, however, it is decidedly non-metallic, and at present the books mostly place it among the non-metals, though it is still customary to speak of the element itself as "metallic arsenic," to distinguish it from the "white arsenic" of commerce, which is, properly speaking, an oxide of arsenic. Compounds of this element have been known for many centuries, chiefly on account of their poisonous character. The yellow sulphide of arsenic, otherwise called "orpiment," was known to Dioscorides, who called it *arsenikon*, probably on account of its powerful properties; the Greek word *arsen*, from which it is derived, signifying "male." Arsenic occurs in the metallic form in nature, usually with ores of iron, silver, cobalt, nickel, and antimony. Large masses of it are found at Zimeoff, in Siberia, and it occurs also in Saxony, Alsace, Bohemia, Transylvania, in the Harz, in Chile, in Japan, at Kongsberg in Norway and in parts of the United States. Combined with other substances, it is one of the most widely distributed of the elements, although the total amount of it in the world does not appear to be large. It occurs in various kinds of pyrites, and is therefore a common impurity in sulphuric acid (much of which is made from pyrites), and in substances in the manufacture of which this acid is used. The minerals known as kupfernickel (niccolite), realgar, orpiment, mispickel (arsenopyrite), and nickelglance (gersdorffite) contain it, as well as many others. The appearance of metallic arsenic varies greatly with the source from which it is obtained, and the method adopted for preparing it. That obtained from pyrites is usually compact, crystalline, and nearly white, while that obtained from arsenious acid is gray and pulverulent. The element is usually described as a "steel-gray metalline mass," which, at ordinary temperatures, has neither odor nor taste. One chemist (Ludwig) obtained arsenic with "a perfectly bright surface, resembling freshly granulated zinc"; but it is doubtful if this was the pure element, since in preparing it he mixed with it a small quantity of iodine. For commercial purposes, metallic arsenic is obtained by refining the element as it occurs in nature, or by extracting it from arsenopyrite. The process of extraction from arsenopyrite consists in heating that mineral in earthenware retorts or tubes, arranged horizontally in a long furnace, and each having a piece of thin sheet-iron rolled up and inserted into its mouth. On

distilling, most of the arsenic condenses on the sheet-iron, from which, after cooling, it may be detached. The product so obtained is further purified by mixing it with pulverized charcoal and re-distilling. The earthenware retorts that are used in the process are made with great care. They are composed of one part of fresh clay and two parts of pulverized bricks or old retorts, and are coated with a mixture of blood, loam, forge scales, and alum, which produces a glaze through which the poisonous vapors of the arsenic cannot penetrate. They are then fired. Arsenic is brittle and crystalline, and its hardness, on the mineralogical scale, is about 3.5. Its specific gravity ranges from 5.2 to 5.7, although a certain variety of it (according to Bettendorff) has a specific gravity as low as 4.71. It has several allotropic forms, one of which is crystalline, and the other black and amorphous. The specific heat of the crystalline variety is 0.083, and that of the amorphous variety is 0.076. Arsenic conducts electricity better than mercury does; for if the specific resistance of mercury at 32° F. be taken as unity, the specific resistance of arsenic is 0.373 at 32° F., and 0.534 at 212° F. The chemical symbol of arsenic is As, and its atomic weight is about 74.44 (Clarke). Its co-efficient of expansion is 0.00311 per degree F. Arsenic oxidizes slowly when exposed to the air, forming a gray powder which is sometimes sold under the name of "fly-powder." It is not affected by pure water. When heated in the air it burns with a blue flame, giving off a characteristic, highly disagreeable, garlic-like odor. When protected from the air, metallic arsenic volatilizes at a red heat, without melting; its vapor being a light citron yellow, and phosphorescent. When heated under heavy pressure, arsenic melts at about 900° F.

Metallic arsenic forms alloys with many metals, some of which are produced by pulverizing and intimately mixing the constituents, and subjecting them to a pressure of 6,000 or 7,000 atmospheres. If much arsenic be present, the alloys are usually brittle. Arsenic is an undesirable impurity in iron, in general, but it is sometimes added to iron and steel for the manufacture of small chains and ornaments, because it makes the metal susceptible of a very brilliant polish. When alloyed with copper, arsenic gives a brittle gray metal, having a brilliant, silvery appearance, which is used somewhat for making buttons. The chief use of metallic arsenic, however, is in the manufacture of small shot. Pure melted lead, when dropped from a height, tends to form tailed drops; but if arsenic be added in small quantities this tendency disappears, and the drops are much rounder. With hydrogen, arsenic forms a very important gaseous compound known as arseniuretted hydrogen, or arsine, and having the formula AsH_3 . This compound is best obtained by the action of sulphuric acid upon an alloy of arsenic and zinc. It is colorless, and so poisonous that Gehlen, its discoverer, was killed by inhaling a single bubble of it. Arseniuretted hydrogen burns with a bluish flame, and metallic arsenic is deposited upon a cold body that is held in the flame. Marsh's test for arsenic depends upon this fact. In executing this test, zinc and sulphuric acid are added to the solution to be tested, and the hydrogen evolved

ARSENICAL POISONING

is allowed to issue from a small jet, where it is lighted. A piece of cold white porcelain is then held in the flame, and if arsenic be present, the characteristic dark, metallic, mirror-like deposit will be produced, owing to the arseniuretted hydrogen that is evolved, simultaneously with the hydrogen. Antimony gives the same kind of a deposit, so that it is important to examine the deposit (or "arsenical mirror," as it is technically called,) to make sure that it is not composed of antimony. Marsh's test is extremely delicate, and will demonstrate the presence of incredibly small traces of arsenic, if proper precautions are taken to ensure absolute purity in the zinc and sulphuric acid that are used. Scheele's green (known chemically as "arsenite of copper") is a compound of copper, arsenic, oxygen, and hydrogen, of a light green color. It was formerly much used in calico printing and for wall paper. Schweinfurth green is a different compound of the same elements, and is used for similar purposes. A great diversity of opinion has prevailed among chemists as to the danger of using arsenical colors, especially in connection with wall papers. Some maintain that "there is no possibility of any arsenical exhalation arising from the walls, as has been alleged"; while others claim that certain microscopic fungi and other low forms of vegetable life act upon these coloring matters, and cause the elimination of arseniuretted hydrogen, which can actually be detected in the air of rooms hung with arsenical papers. Schweinfurth green is better known in the United States by the name "paris green," and is much used for preventing the destruction of crops by insects.

The most familiar compound of arsenic (with the possible exception of paris green) is undoubtedly arsenous oxide, As_2O_3 (often written As_2O_5), or "white arsenic," known to the general public simply as "arsenic." This is used extensively in the arts, in the manufacture of indigo blue and anilin; in glass-making, to remove the color due to the lower oxides of iron; in fly and rat poisons; in taxidermy; and for many other purposes. It is very poisonous, and in the 16th and 17th centuries was commonly used for removing persons who were conceived (by their enemies) to have outlived their usefulness. Nearly all the great poisoners of that period were women. In 1659 a secret society of young wives was discovered in Rome, whose chief object was to make away with the husbands of the members by the use of arsenical preparations. Hieronyma Spara, the woman who provided the members with the poison and instructed them in its use, was eventually executed, together with 12 others. An even more notorious case was that of the woman Tophania, who lived at Palermo and at Naples, and prepared, for wives who desired to be freed from their husbands, a poison known as *aqua Tophania*. This "aqua" purported to be an oil that oozed from the tomb of St. Nicholas of Barri; but as a matter of fact was an arsenical solution. "White arsenic" is not very soluble in water, and as four drops of Tophania's preparation were reputed to constitute a fatal dose, it is not unlikely that it consisted essentially of potassium arsenite, K_2AsO_3 , a substance which is formed when "white arsenic" is dissolved in a solution of potash. Tophania plied

her nefarious business from girlhood to the age of 70, but her crimes were ultimately brought home to her, and she was tortured and put to death. Detection almost certainly awaits the poisoner of to-day who uses arsenic, and a career such as Tophania's is absolutely impossible.

Ar'sen'ical Poisoning. Arsenic is now used in so many ways that accidental poisoning occurs very often. As a poison employed in committing suicide, and for slow poisoning with homicidal intent, its popularity is on the wane. The forms of poisoning mostly seen are of the chronic type. These occur from the use of paints containing large quantities of Schule's green or Paris green, from the use of spraying solutions, now so widely employed as a means of protection from insect and fungus pests, and from the addition of arsenic to food stuffs, as a preservative. Acute forms of poisoning are more often the result of attempts to commit suicide. In acute arsenical poisoning the early symptoms are those of an acute inflammation of the stomach and intestines, coming on about half an hour after taking the poison. There are violent cramp-like pains, with nausea, vomiting, and diarrhoea, closely following the premonitory symptoms of distress, difficulty in swallowing, and constriction in the throat. The severe symptoms multiply, the diarrhoea becomes watery, "rice water" and blood may appear in the vomit. A cold, damp skin, weak and feeble heart-action, collapse and sighing respiration may precede death, attended at times with convulsions. Death may occur within 24 hours, but it is apt to be delayed from two to four days, the patient usually dying of the secondary degenerations in the organs and of exhaustion. Death by arsenic is very painful. It is, moreover, an extremely uncertain poison, because of its insolubility, and of the vomiting reaction it induces. Many acute cases pass over into the chronic stage of poisoning.

Chronic arsenical poisoning may result from a single large dose, but more often results from the long-continued use of small quantities of the poison. In a recent outbreak of chronic arsenical poisoning in Manchester, hundreds of people were affected. The source of the poisoning was from arsenic in iron pyrites employed in making sulphuric acid; this certain sulphuric acid had been utilized in the manufacture of glucose. Several firms had purchased this glucose for the manufacture of beer, and many hundreds of the consumers of this beer suffered from various forms of arsenical poisoning. Chronic arsenical poisoning may result from the use of wall-papers and hangings colored by arsenical dyes, although such modes of poisoning may be considered extremely rare. The symptoms of this type of poisoning are of gradual onset: the patient is languid, weak, and loses his appetite. There is discomfort in his intestines and diarrhoea or constipation may result. A sub-acute inflammation of the mucous membrane of the nose and gums then develops, with sore gums, puffiness under the eyes, and running from the nose. Sneezing, coughing, and hoarseness may occur, various skin eruptions are not uncommon, and a curious pigmentation of the skin is nearly always observed. The patients progress until poisoning of the ends of the nerves begins, with disturbances in sensation,

ARSENIOUS ACID — ART

anæsthesia, paresthesia, and pain. There may then develop paralysis of the extremity, frequently the toe, (drop-toe); or the wrist, (drop-wrist). Paralysis of sensation may also occur. The course of a chronic poisoning may not be over three or four days, but it usually requires three or four weeks, sometimes longer. Some individuals use arsenic throughout their lives and are never poisoned. The treatment of acute poisoning consists in the thorough and prolonged washing out of the stomach and the use of large quantities of magnesia. Supportive treatment is needed in the stage of collapse. Heat, alcohol, and coffee are indicated. In chronic poisoning electricity and tonic treatment are required.

Arsenious Acid, the arsenical compound familiarly known and popularly called arsenic. It is obtained principally during the roasting of the arsenican nickel ores in Germany in furnaces communicating with flues. The ordinary arsenious (which is what is popularly known as arsenic) is a white crystalline powder, decidedly gritty, like fine sand, and with no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in water, to the extent of 1 part of acid in about 100 parts of cold water, and 1 part of acid in about 10 parts of boiling water. When placed in a spoon or other vessel and heated, it volatilizes and condenses in crystals on any cool vessel held above. By this means it can be distinguished from ordinary flour, which, when heated, chars and leaves a coal behind; and from chalk, stucco, baking-soda, tooth-powder, and other white substances, that when heated, remain in the vessel as a non-volatile white residue. In some countries, as in the mountainous regions of Austria, Styria, and the Tyrol, arsenic is eaten habitually, beginning with small doses and gradually increasing them. It is said to favor nutrition, and to improve the respiration in ascending heights. Some of the "arsenico-phages" can take great quantities with impunity.

Arsenolite, a native trioxide of arsenic, having the formula As_2O_3 (often written As_2O_5), and crystallizing in the isometric system,—usually in octahedrons. It is commonly white, with a vitreous lustre. Its hardness is 1.5, and its specific gravity about 3.71. It occurs in connection with ores of silver and lead, and with those of other metals when arsenic is associated with them. In the United States it has been found in Nevada and California. Arsenolite and senarmonite (an antimonial mineral of analogous composition and similar crystalline form) are collectively known by mineralogists as the "arsenolite group."

Arsenopyrite, ar-sen-o-pi'rīt ("arsenical pyrites"), a tin-white, opaque mineral, with a metallic lustre, crystallizing in the orthorhombic system. It contains arsenic, iron, and sulphur, and has the formula $FeAsS$. Its hardness varies from 5.5 to 6.0, and its specific gravity from 5.9 to 6.2. Arsenopyrite is largely used as a source of "white arsenic," or arsenic trioxide. It occurs chiefly in the crystalline rocks with gold and ores of silver, lead and tin. It abounds in Germany, England, and the United States.

Arsinoë, ār-sin'ō-ē, the name of several celebrated women of antiquity, the most noted of whom is the daughter of Ptolemy I. of Egypt

and Berenice: b. about 316 B.C.; she married Lysimachus, king of Thrace, in 300 B.C. Desirous of securing the crown for her own children, Arsinoë prevailed upon Lysimachus to put Agathocles, the son of his former wife, to death. This crime proved fatal to the Thracian king; for Lysandra, the wife of the murdered prince, fled with her children to the court of Seleucus Nicator of Syria, who took up arms in her favor. In the course of the war Lysimachus was slain and his kingdom taken possession of by the conqueror. Arsinoë now fled into Macedonia, which was soon overrun by the Syrian army. In less than a year afterward, however, Seleucus was assassinated by Ptolemy Ceraunus, half brother of Arsinoë. This queen, who held the city of Cassandria in Macedonia, was induced, under promise of marriage, to admit Ptolemy within its walls; but no sooner had he entered than her two children were butchered before her eyes. She succeeded in making her escape to Egypt, where she became the wife of Ptolemy II., Philadelphus, her own brother (279 B.C.), thus affording a precedent to these unnatural unions which afterward became common among the Greek rulers of Egypt. She bore no children to her brother, who, however, seems to have had a strong affection for her, as he called one of the districts of Egypt by her name and employed the architect Dinocrates to build a temple in her honor.

Arsin'oe, a city of ancient Egypt, on Lake Mœris, said to have been founded about 2300 B.C., but renamed after Arsinoë, wife and sister of Ptolemy II., of Egypt. The site of Arsinoë is now occupied by the town of Medinet-el-Faum. The sacred crocodiles were kept here.

Ar'son, the malicious and wilful burning of a dwelling-house or out-house belonging to another person by directly setting fire to it, or even by igniting some edifice of one's own in its immediate vicinity. If a person, by maliciously setting fire to an inhabited house, cause the death of one or more of the inmates, the deed is murder, and capital punishment may be inflicted. When no one is fatally injured the crime is not capital, but is still heavily punishable; it is a penal offense also to attempt to set a house on fire, even if the endeavor does not succeed. The New York Penal Code provides that a person who wilfully burns, or sets on fire in the nighttime, either (1) a dwelling-house in which there is, at the time, a human being; or (2) a car, vessel, or other vehicle, or a structure or building other than a dwelling-house, wherein, to the knowledge of the offender, there is, at the time, a human being, is guilty of arson in the first degree.

Many statutory changes have been made in the common law upon this subject. There are three degrees of arson in the State of New York. Arson in the first degree is punishable by imprisonment for any term not exceeding 40 years; in the second degree by imprisonment for a term not exceeding 25 years; in the third degree for a term not exceeding 15 years. Before the crime of arson is complete, the house, or some portion of it, however small, must be burned, or consumed by fire.

Art, in its most extended sense, as distinguished from nature on the one hand and from science on the other, has been defined as every

regulated operation or dexterity by which organized beings pursue ends which they know beforehand, together with the rules and the result of every such operation or dexterity.

In æsthetics, art as distinguished from science, consists of the truths disclosed by that species of knowledge disposed in the most convenient order for practice, instead of the best order for thought. Art proposes to itself a given end, and, after defining it, hands it over to science. Science, after investigating the causes and conditions of this end, returns it to art, with a theorem of the combination of circumstances under which the desired end may be effected. After receiving them, art inquires whether any or all of those scientific combinations are within the compass of human power and human means, and pronounces the end inquired after attainable or not. It will be observed here, that art supplies only the major premise, or the assertion that the given aim is the one to be desired. The grounds of every rule of art are to be found in the theorems of science. An art can then consist only of rules, together with as much of the speculative propositions as comprises the justification of those rules. Though art must assume the same general laws as science does, yet it follows them only into such of their detailed consequences as have led to certain practical rules, and pries into every secret corner, as well as into the open stores of the household of science, bent on finding out the necessities of which she is in search, and which the exigencies of human life demand. Hence, as Edmund Burke remarks, in his 'Treatise on the Sublime and Beautiful,' "Art can never give the rules that make an art." It must always owe them to science. Whatever speaks in precepts or rules, as contrasted with assertions regarding facts, is art; and hence it always adopts the imperative mood, whereas, science almost invariably adopts the indicative. Science is wholly occupied with declarations; art is wholly engaged with injunctions that something should be done. Thus, the builder's art desires to have houses, the architect's art desires to have them beautiful; and the medical art desires to cure diseases of the human body.

In a special sense art is the practical carrying out of the principles of science; a series of rules designed to aid one in acquiring practical skill or dexterity in performing some specified kind of work, manual or mental. The several arts may be arranged in two groups—(a) the mechanical, and, (b) the liberal or fine arts. The mechanical arts are those which may be successfully followed by one who does not possess genius, but has acquired the facility of working with his hands which long practice imparts. Such are the arts of the carpenter, the blacksmith, the watchmaker, etc. They are often called trades. The liberal or fine arts are such as give scope not merely to manual dexterity, but to genius; as music, painting, sculpture, architecture, etc.

In mediæval education, the arts signified the whole circle of subjects studied by those who sought a liberal education. This included science as well as art. The seven liberal arts, which, in the palmy days of Rome, plebeians were not allowed to study, were thus divided: (1) the *Trivium*—namely, grammar, rhetoric, and logic; (2) the *Quadrivium*—namely, arith-

metic, music, geometry, and astronomy. It is a remnant of this classification, which was in vogue as early as the 5th century, that we still speak of as the curriculum of arts at a university, and that graduates become bachelors or masters of arts. See ARCHITECTURE; MUSIC; PAINTING; SCULPTURE, etc.

Art, American'. The art history of America presents interesting conditions of receptivity, as well as original productivity; indeed, artistic taste, it may be claimed, was primarily transplanted or transfused into the budding art of "The Fair New World." True to the traditions of historical repetition, the ideals of ancient Greece inspired an Italian renaissance; French, German, and English art respectively, being viewed moreover at their best periods, give evidence of having been begotten through æsthetic assimilation and fruitful appreciation of the masterpieces of Angelo, Titian, Tintoretto, Rembrandt, Rubens, Veronese, and Velasquez. The early American school not only emulated these treasured qualities of the old masters, as far as accessible in painting and sculpture of originals or in replicas, but experienced a healthful art evolution, normally stimulated by the contemporary works of Gainsborough, Reynolds, Lawrence, and others, at the close of the 18th century. It appears in accord with the artistic spirit of international reciprocity, that America provided the British Royal Academy with its second president in the personality of Benjamin West.

Although it would be intensely interesting to explore the field of Pan-American art, revealing Aztec and other aboriginal archæological relics, we are limited to the consideration of the subject co-incidental with modern art and civilization. The works of Washington Allston, Gilbert, Stuart, West, Copley, Trumbull, Vanderlyn, Jarvis, Peele, Cole, Harding; and, at a later period, of Morse, Eliot, Mount, and many others, afford invaluable examples of rare intrinsic value, with chronological evidences of the early development, impeded by all sorts of obstacles, of inborn genius and unmistakable tendencies of the American progressive element even in the province of fine art. A representative collection of the famous works by the American painters mentioned, had it been secured, would certainly to-day constitute a rare gallery of æsthetic "Americana" that well might be preserved for all time—"con amore"—"*pio patria et gloria*", enkindling American art patriotism in line with that shown for the army and navy, agriculture and commercialism. It is too late, however, to secure the marvelous masterpiece by Allston, 'The Legend of the Bloody Hand,' it having unfortunately been destroyed by fire, and many other gems of renown are now lost sight of, through lack of proper preservation and of popular appreciation. Vanderlyn's 'Ariadne,' however, has fared better in company with invaluable portraits, painted by these gifted men and now in possession of the New York Historical Society. 'Marius Sitting Among the Ruins of Carthage,' a work that secured Vanderlyn, in reward for its merits, a first-class gold medal at the Paris Exposition, was a product of this period. The most important epochs of American history have been represented by native artistic talent. The sailing and landing of Columbus, the exploits of De Soto, the subj-

gation of savage life to that of civilization, Colonial and Indian warfare, the declaration of national independence, Revolutionary battles, Washington crossing the Delaware, and like famous subjects for painting and sculpture, that manifestly should be preserved by governmental direction. Although so long and disastrously belated, these facts and conditions logically suggest the formation of a national gallery of American art. The landscapes of Thomas Cole upheld, as did those of Turner, the traditions of Claude Lorraine; still in the spirit of a pioneer he proclaimed the grandeur of the primeval American forest in paintings direct from nature. His 'The Course of Empire,' now in possession of the New York Historical Society, a work that has never, we believe, been reproduced in any form, presents in four grand paintings the sway of civilization from savage life to an Arcadian period; then onward to the consummation of earthly power and magnificence; followed by the decadence occasioned by war of the elements, and that instigated by "man's inhumanity to man"; finally, the literal scene of monumental destruction and sublimely solemn desolation. Before dismissing attention called to this early period influenced, as stated, by foreign methods of technical expression, native American genius found little public appreciation; still it faithfully progressed. Again about this time matter-of-fact utilitarianism appeared to dispel the ideal artist's poetic hopes, while every encouragement followed the success of practical scientific talent. Washington Irving essayed to be a painter, but concluded to devote his life to literature and the power of the pen. Robert Fulton, who began his career as a skilful landscape and portrait painter, attracting the friendship of Benjamin Franklin, who encouraged his studies abroad, and gave him letters to Benjamin West and others, returned to his native land to find that scientific conditions were required rather than a demand for the credentials of culture in works of fine art. The result was steamboat navigation. Another triumph for science may be recorded. Franklin himself had captured lightning from the skies; still it remained for the imagination and artistic skill of the professional painter, Samuel Finlay Breese Morse, the first president of the National Academy of Design, to subjugate the marvelous electric element that joins as neighbors all mankind.

Nevertheless, the fine arts flourished; even modern travelers' tales of the wonderful scenery of two great continents stimulated artists and the lovers of art. "The Heart of the Andes," "Niagara," "The Arctic Region," "The Rocky Mountains," "The Catskills," "Lake Champlain," "Lake George," and the "Hudson River," all were delineated. Along with this demand for great subjects, often commensurate in quantity as to size of canvas with Ruskin's mathematical maxim: that the greatest work of art is the one presenting the greatest number of great ideas; there still prevailed in marked instances the glorious traditions of full-habited oil-painting to be found in the æsthetics of familiar environment of earth, air, and water, as embodied in artistic values and soulful qualities—creations in harmony with Michel, Ruysael, Constable, and the masters of Barbazon and Fontainebleau. Again, while scientific influences appear in the works of Durand, Church, Casalear,

and Kensett, they asserted a truly American artistic individuality; they copied directly from nature. They thought of no school nor technique, but carefully imitated what they saw. All these men with one exception had been practical engravers, laying down the burin and the needle-point to take up the pencil and the brush. Their respective biographical and æsthetic records in American art will be enduring; yet there comes the reflection that had their professional training been more liberal and adequate they would have attained to higher things. The importance of masterly academic training cannot be overestimated; as a means to an end, however great, education is the only acknowledged guide for the individual artist and for the community even in matters of taste. Nothing is more creditable to a civilized people than its credentials of culture. The formation of a fine art association in its chief city was at the beginning of the past century an occasion of vast importance to our commonwealth. The first action was taken in 1802 by a few prominent citizens, and six years later a charter was obtained with the name of The American Academy of Arts. The first officers under this charter were Robert Livingston, president; John Trumbull, vice-president; DeWitt Clinton, Dr. David Hosack, John R. Murray, William Cutting, and Charles Wilkes, directors. A school was equipped with casts brought from Paris by Mr. Livingston, and exhibitions of paintings and statuary were held for a time in an unused riding school in Greenwich Street near the Battery. Public interest in this movement was soon transferred to grand panorama schemes conducted by Vanderlyn at the "Rotunda," and by others with similar enterprises. It was not until the year 1826 that the artists themselves, with Morse as president, founded the National Academy of Design in the earnest interests of American art, with educational purposes and exhibitional facilities; its influence increasing until the present day. Its membership consists of one hundred academicians and an equal number of associate members, including the most distinguished painters and sculptors of America. Its list of fellowship for life likewise includes the most prominent public-spirited patrons of American art.

Established for many years in the Academy building, tastefully modeled after the Palais Ducal of Venice and forming an attractive urban landmark, lack of accommodations for its growing schools, and crowding commercial surroundings, required a move to more suitable quarters. Unlike the Royal Academy of London, with its plethoric treasury, and similar institutions situated in other European art centres, the academy is without governmental endowment, and may well enlist American art patriotism in the cause of æsthetic culture in fostering the fine arts of painting, sculpture, and architecture. Other societies of American artists, water color societies, and architectural leagues make annual exhibitions in New York; while art institutes throughout the United States, in various cities attest the extent and importance of American art. We, as Americans, are an artistic people, cosmopolitan, and composite, uniting the genius of all nations. The æsthetic field of general American artistic taste and industry has been strenuously productive. The

ornamental, orderly, and decorative work in clay, on china, glass, wood, and stone as a tasteful and profitable divertimento, begins with the training of the kindergarten. Black and white illustration and etching has been awarded first-class medals at home and abroad. The beautiful and refined exemplified in aquarelle and oil-painting, in portraiture, genre, and pastoral; in sculpture and architecture; and finally the grand and sublime of high art, all confirm the achievements of American art and artists.

In advancing these three divisions,—the ornamental, the beautiful, and the sublime,—as a guide, we approach the philosophical consideration of the subject of fine art. What is, and what is not, fine art? Shakespeare's injunction "to hold, as it were, the mirror up to nature" is the best artistic advice ever given. Bacon in his essay is not so direct. He asks which is the greater trifter, one who would make a personage by geometrical proportions (perhaps by the fabled Greek cabala) or another who would select the best parts of divers faces to make one excellent (a veritable composite picture)? He concludes at last that a painter may make a better face than ever was, but he must do it by a kind of felicity, as a musician who makes an excellent air in music, not by rule. If ever there was an artist he was Shakespeare—if ever there lived a scientist, Lord Bacon was, perhaps, the most eminent, and in their respective views and definitions we find the differentiation between science and art. In any given work in so far as it may be mechanically constructed is presented a scientific product; and in so far as reproductive processes may exhaustively duplicate it, it falls short of the possibilities of fine art. An etching by a master may be an autographic art creation; but when it is possible through photography, photo-gravure or chromo-lithography to so perfectly duplicate a painting, that the reproduction presents all the merits of the original, it may be realized to science rather than be accepted as genuine fine art. True consummate mechanism must ever go hand in hand with fine art; still a great work of art presents the maximum of art to the minimum of mechanism. A painting portraying living objects with a sharp contour, such as may delight the photographer, without the suggestive quality of stereoscopic relief, does not hold the mirror up to nature, and the work may be classed with scientific achievements even if accredited to the consummate mechanism of a Messonnier. Indeed reproductive processes have served a great purpose in defining the line of demarcation between science and art. Affectations have been swept away by a revelation of their superficiality; while the possibilities of inimitable fine oil-painting, a medium and technique that, of all ever employed, has the fewest possible limitations, have been enhanced as seen in the works of the American artists already mentioned; and in those of a growing group of American idealists, colorists, and tonalists. Various have been the fashions or "isms" that have dominated American art at different periods of its history. Preraphaelitism as advocated by Ruskin was one of the earliest imported. Being appointed the legal executor of his hero-client, as well as being an enthusiastic admirer of his work, Ruskin claimed for Turner not only the grander

qualities, but a command of detail that rivaled the ancients, although the artist, we are told, frankly declined the compliment. Turner was unquestionably the greatest modern master of decorative and scenic effect in pictorial combinations representing earth, air, and water, being, indeed, entitled to the apotheosis of synthesis; still diligent search in the archives of the Royal Academy and National Gallery fails to reveal the qualities attributed to him by the author mentioned. Ruskin's enthusiasm proved contagious throughout the art circles of England and America; solicitous friends as well as the most influential art writers pleaded with the tyro to emulate not the work of Michael Angelo, Titian, or Raphael himself, but to follow in the footsteps of Perugino and Raphael's father or grandfather. This verily seemed like unto the dotage of imbecility in the light of Raphael's glorious art that had evolved the immaculate Sistine Madonna. He was brave, indeed, in the field of American art of that day, who could resist the popular and professional pressure of this pseudo-aesthetic movement. No vestige of it remains, and no wonder it was followed by impressionism—as a free and joyous transition from mechanical restrictions in art. This was the artistic attempt to present the maximum of soulfulness conveyed to the world by finest art; employing the minimum of materiality and mechanism as seen in the rendition through mental vision of the fleeting sunset or twilight—such as may only be materialized on the morrow; the epitomization perhaps of a day's outing under the open skies or flying clouds, or in the sublime thunder-storm; in fact, the entire realm of imagination is unfolded by artistic impression. Such was the accepted province of genuine impressionism originally as associated with the artistic convictions and poetic spirit of Corot, Monet, Monticelli, William Hunt, William Page, George Fuller, and many others. Impressionism naturally evolves symbolism and idealism, but in too many instances has deteriorated into affectation and mysticism. Premeditated and assumed mysticism is the *dernier-resort* of mediocre painters and sculptors, as well as of the minor poets. It may not be mistaken for sublime spirituality. Dante, Shakespeare, and Milton, treating even divine themes, never nebulized their ideas in mysticism; the same may be said of Bryant and Longfellow; while Poe, temperamentally, a mystic solitudinarian, in the field of poetic art presented the apotheosis of spirituality.

The crowning glory in the art of any civilized country is that of naturalism. In the truest sense it utilizes even scientific "dissecta membra," as enumerated, and subjugates the same to the entirety of art. The comprehensive structural organic presentation of material nature, suggesting the qualities of size, form, weight, color, and perspective values; chiaroscuro, and, above all, the ultimatum of expression and tone. These enduring qualities characterize the art of Innis, Martin, Wyant, Hunt, and Page, and the growing group of American tonalists of the naturalistic school. A great advantage exists in American art from its cosmopolitan resources. In Paris one sees nothing but French art; in Munich, the German school; in London, English art, while the art institutions of America contain specimens of masterpieces from every

ART EDUCATION

source, notably the collection of the Metropolitan Museum of Art, and art institutes of Brooklyn, Boston, Chicago, Philadelphia, and Pittsburgh, as well as collections in all our large cities. While every art centre of Christendom seems to be provided with an American colony of artists and students, expatriation is no longer a necessity in order to obtain an education in fine art. The Academy and various art student leagues are conducted by eminent instructors distinguished with every honor obtainable at home or abroad. The prospects of a greater appreciation of American art open with the new century, as interest in the pursuits of peace should naturally follow national expansion. Advocacy of our chief art educational institutions is a feature of metropolitan aggrandizement; millions have been given to libraries and various institutions of learning; and fine art should be included with erudition, as the essential credential of culture. Timely attention may be called to the requirements of the pioneer American art institution, founded by the immortal Morse and his co-workers eminent in art instruction, and being associated with the career of America's greatest masters in painting, sculpture, and architecture. In accord with urban expansion it has departed from its classical landmark, a diminutive "Palais Ducal," to a most accessible and beautiful site, upon the acropolis of the metropolis, facing Cathedral Driveway, Morningside Park, New York city. As the leading exponent of American art instruction, through schools and exhibitions, it is planned to erect an edifice that shall do justice to the artistic taste of the New World's metropolis, and to the original National Academy of Design.

The Department of Commerce just established by the general government is a step in the right direction of national affairs, and may make clear the way for the proposed Department of Art and Industries. It has been repeatedly advocated and constant evidences of its requirement as an absolute necessity have been presented to the government and to the people; still it is being detrimentally delayed. The appropriations for national and international expositions have repeatedly been used in a manner giving anything but satisfaction. Commissions and contracts for statuary, monuments, and architecture that should receive the supervision of expert art judgment are left to provisional committees of statesmen, who frankly admit their inability to judge in the affairs of fine art. The disastrous experiences resulting from this careless management of each and every international exposition, including the Centennial, the New Orleans, the Chicago Columbian, and the Buffalo Pan-American, certainly teach that no similar enterprise should be thrust upon the community for co-operation through flattering prospectuses, promises of profit, etc., until matured and definite plans and specifications shall have been officially inspected, approved or rejected by the projected national department of art and industries; this would also provide a valuable bureau of information in art affairs, enabling legislator and citizen to act or vote intelligently in regard to any appropriation, commission or tariff. The practical utility and public good to be derived from such a department may be demonstrated in many instances. A member of Congress having been appointed upon a committee assigned the duty of super-

vising the ground immediately surrounding the House of Representatives was astonished to find that millions of dollars had been expended upon the same; each new committee annually appointed having exercised its taste and judgment on the important matter. It was concluded that the advice of an expert landscape architect be secured, and this being done, the expenditure was practically ended. Again the enormous expense of indiscriminate illustration of congressional and department literature or printed matter has, to-day, caused anxiety and criticism. So in relation to all official cases requiring expert art supervision, eclectic sense and æsthetic taste should be at the service of the government. The plan involves no untried innovation; the French nation has its Minister des Beaux Arts, who is a member of the Cabinet of the Republic of France, leading the world in art affairs, taste, and fashion. The establishment of Municipal Art Commissions is a step in the right direction. The task of correcting the contour of metropolitan architecture seems, indeed, herculean; individual buildings of great beauty are adjoined by the most heterogeneous structures; a three-story house appears between one of eight and a sky-scraper of twenty. In no capital of Europe would such incongruities be permitted, and every possible facility should be afforded our Municipal Art Commissions to correct this chaotic condition. The one effectual way, with general public guidance, can alone be secured by the establishment of a National Department of Art and Industries; presenting valuable statistics with all existing architectural models and designs. Victor Hugo said "the beautiful is as useful as the useful, more so, perhaps." European municipal politics profit by the practical application of this fact; great cathedrals, public statuary, and fountains, picture galleries and museums attract multitudes of tourists, thereby financially as well as æsthetically benefiting communities that keep in the vanguard of culture and civilization.

Art Education. Since 1870 the rapidity of the development of art and industrial education in the United States has been so marked and so effective, the rapid increase in the number of special schools and museums of the fine arts so striking, as to make exceedingly difficult a satisfactory survey of this subject within the limits of the space allowed. The movement for the general introduction of drawing in the public schools, and of definite endeavors to promote art education, with a purpose to develop and improve the art industries of a people, seemed alike sudden in England and in the United States. In England it was apparently the definite result of the first world's fair—the exhibition of 1851; in the United States it had its origin in Boston in 1870, where it was a direct outcome of the English movement.

ART EDUCATION

The Centennial exhibition in Philadelphia in 1876, where the work in drawing of the Massachusetts normal art school and of the public schools in Boston was shown, made possible the rapid and remarkable development throughout the United States of the two kindred elements in education, namely, industrial art drawing and manual training.

As the English were long held to be a people hopelessly inartistic and devoid of art possibilities, their wonderful development since 1851 in so many lines of artistic manufactures challenges investigation, especially by a people long similarly accused as being innately inartistic, and for a long period, it must be admitted, apparently deservedly so accused. The causes of this lack of art development as recited by Haydon were the same in both countries. That these causes were amply sufficient to account for this almost entire absence of any national evidence of art consciousness,—without compelling the admission of any inborn lack of mental capacity,—Haydon sought to demonstrate, by an appeal to the art development of England during the 13th century: "When England, in her knowledge of form, color, light, shadow, and in fresco decoration, was in advance of Italy; and had her progress not been checked by the Reformation, would have been at the head of Europe." "Show the people of England fine works," said Haydon; "give them the opportunity of study and the means of instruction; teach them the basis of beauty in art, and then give your opinion, if you like; but you have no right to condemn your fellow countrymen when you give them none of the advantages foreigners enjoy; when you have no schools for art instruction, no galleries open to public view, no national collections, no schools of design, and when you refuse to allow that art has a public function, and absolutely withhold from it all public support."

However true is his picture of the absence of any opportunities for the people to see works of art, or to enjoy any personal training in the elementary knowledge of art in the England of his day, the lack of all such opportunities in the United States was ten-fold greater. The Puritan immigrants of New England had all the abhorrence of art which marked the followers of the Reformation, and for two centuries the bare whitewashed walls of their plain meeting-houses were eloquent in protest against the art adornments of ancient church or chapel. Nor did the long, hard struggle to wrest sustenance from stony soil and stormy sea afford any space of leisure for those artistic occupations which to the stern Puritan were worse than folly.

Such was the situation, alike in England and the United States, during the first half of the 19th century. The exhibitions of 1851 and 1876 seem in turn to have revealed to each people their own artistic deficiencies.

Progress of Art Education—In 1749 Benjamin Franklin published his proposed 'Hints for an Academy,' and enumerated as the most useful studies, arithmetic, writing, drawing, and mechanics. In this connection drawing is seen to be reckoned with mechanics as a useful study. So more than 100 years before Boston had put drawing into its public schools, this Boston boy sought to have his fellow citizens of Philadelphia adopt it in their schools as a required study.

In a Lancastrian school presided over by Mr. Fowle in Boston in 1821, the method prevailed of having the younger pupils taught by those of their fellow pupils a little in advance of them. This method was, in its fundamental idea, successfully adopted by Walter Smith, in his first introduction of drawing as a required study in the public schools of Boston, and has since been followed in many of the public schools throughout the country. The arguments for the teaching of drawing in the public schools are clearly and concisely stated by Mr. Fowle in his introductory words to the third edition of his book on drawing, issued in 1830. Mr. Fowle also introduced in his school, physical science, music, and, for the girls, needlework. In this sewing form of "manual training" Miss Dorothy Dix, later the noted philanthropist, was his first teacher. So it appears that our modern new educational movement was clearly foreshadowed in this Boston school three quarters of a century ago!

In 1838 Henry Barnard, editor of the 'American Journal of Education,' delivered an address in many parts of the country on the topic of industrial education, and urged that drawing should be taught in the public schools. In the 'Connecticut Common School Journal,' published in Hartford, of which Dr. Barnard was editor, he reprinted the report of Prof. Stow on Prussian schools, made to the legislature of Ohio in 1838. In occasional numbers during succeeding years much attention was given to the subject of drawing in its various phases. In 1838-9 Miss E. P. Peabody gave a course of free lessons in drawing in the Franklin School, Boston, and in 1841-2 a similar course to a class of 100 teachers of primary schools. Miss E. P. Peabody and her sister, Miss Mary Peabody (later Mrs. Horace Mann), each published an elementary treatise illustrating their methods of teaching drawing and reading.

Such is a brief summary of a few of the early efforts by American educators to introduce the study as one of the essential elementary studies to be taught in all public schools. Similar vain efforts to promote the early training in drawing were from time to time made by leading artists. Among these perhaps the most notable and earnest attempt was made in Philadelphia by the distinguished artist Rembrandt Peale during the years 1843-4. As in Boston and in Philadelphia, earnest efforts to introduce the study of drawing in the schools long preceding 1870, had been successfully thwarted by the opposition based chiefly on ignorance and lack of appreciation; so it resulted in Baltimore, when in 1848-9 Mr. William Minifie, a remarkable man, taught drawing in that city as a science, and not simply as picture-making. This competent master was, however, removed, through the influence of an unsympathetic, ignorant committeeman, and so Baltimore lost the opportunity, else within reach, of anticipating the success of Boston by a quarter of a century. Mr. Minifie published his system of teaching, drawing, and perspective and shadows, which has long held its place as a recognized authority. About 1852 this work was adopted as one of the regular text-books, used in the South Kensington art schools of London, Eng., and which, it may be fairly assumed, Walter Smith studied; at least the underlying principles of the system of Prof. Minifie and those of Prof. Walter Smith

ART EDUCATION

are practically identical. As professor of drawing in the School of Design of the Maryland Institute in 1852-4, Prof. Minifie delivered and published three public addresses on drawing and design; in these the teaching of drawing as a regular study in the public schools was eloquently urged. To one who remembered the ability and methods of Prof. Minifie, and the work done by his pupils of the high school, as far back as 1848, the exhibition made of drawings by the Baltimore High School in the Centennial exposition in Philadelphia in 1876 was pitiful indeed.

Cleveland, Ohio, seems to have been more fortunate than the cities whose experience has just been briefly recited. In 1849 drawing was put in the schools as a regular exercise, and after a few months was intrusted to the regular teachers of the public schools, who eventually found in the late Prof. John Brainerd an enthusiastic instructor, who took such interest in their work that he followed them to the schools and aided them in teaching the pupils; in the end the professor was put in charge of the work in all the schools, and for several years remained with gratifying results. He published a manual for use in the schools. Subsequently Prof. Brainerd was for years an examiner in the United States patent office in Washington.

In this brief summary of various sporadic efforts in different cities and communities to introduce drawing in the schools, it is clear that the desirability of general instruction of the school children in drawing was in the process of becoming a popular belief, and in American communities this is usually the precursor of legislative action. While these efforts, as we have seen, had been confined to no single section or State, and indeed in some towns and cities drawing had already secured foothold in the schools, the movement in Boston, and in a degree through the State of Massachusetts, was more pronounced than elsewhere. In this State certain studies which are required to be taught in all public schools are enumerated in the law, while certain other studies are recorded as permissible at the discretion of the school committee. Thus, the trend of the upward and onward direction in the progress of elementary education is indicated by the appearance of certain studies as "permissible." In the law of 1860, "algebra, vocal music, drawing, physiology, and hygiene" are thus recorded as permissible. This is believed to be the first legal recognition of drawing in this category. In 1869 the board of education is directed to prepare a plan for free instruction of men, women, and children in mechanical drawing, applicable to all towns and cities of 5,000 inhabitants or more. In the law of 1870 "drawing" appears as a required study in all public schools, and "any city or town having more than 10,000 inhabitants shall annually make provision for giving free public instruction in industrial or mechanical drawing, either in day or evening schools under direction of the school committee." The annual reports of the board of education of Massachusetts, about that time, show great interest in promoting the study of drawing, and later in developing technical industrial education with special reference to the manufacturing interests of the State.

In the report of 1870-1 "The Worcester County Free Institute of Industrial Science" in the city of Worcester (changed in 1877, by

act of legislature, to "The Worcester Polytechnic Institute"), incorporated in 1865, is highly praised and pointed out as the only school in the State where such an education can be obtained.

As already indicated, the history of the slow development in the artistic training of youth in this country closely resembled in its several stages that of its progress in England, though, happily, there is here no story of individual effort and failure quite so tragic as that of the unfortunate Haydon; though the story of the last days of Walter Smith in America, just before his return to his native country, where he was gladly welcomed to an honorable career, all too brief owing to his untimely decease, is not one to be dwelt on by Americans with any especial pride. He brought rare and precious gifts to America, while to his splendid abilities as a great teacher, and to his contagious enthusiasm, which inspired the eager youth who clustered about him, the final success of the new elements in popular education — industrial art and manual training — are more largely due than to any other single influence.

Although during a century of progress sporadic efforts were made in various localities to introduce the teaching of drawing in schools, there was no permanent or general success. It was not till the system of public schools had become general, and the experiment of teaching the same thing at the same time to a large number of pupils had been proved feasible, that the time was ripe for the general introduction of industrial drawing and manual training. Before this the teaching of drawing had been a personal matter between pupil and teacher, and no conception that it was possible to teach the elements of drawing to large classes at once had dawned upon educators.

The so-called "farm schools," which had a certain vogue in the earlier years of the present century, had proved failures as might easily have been foreseen, since it was not found feasible to work young men for remuneration so constantly, as was requisite to make them self-supporting as well as school-supporting, while taxing them with the mental work essential to their obtaining anything that would merit the name of an education.

In the first annual report made by Gen. John Eaton, commissioner of education, in 1870, there appeared an interesting record of the results attained from an effort to ascertain the direct worth to a workman of the education given in the common elementary public schools. The concurrence of testimony showing that even this small portion of knowledge and mental training was of real pecuniary value to its recipient was convincing, leaving no room for question but that the community was amply repaid for all the cost of the common schools by the increased earning power of their pupils. If this was true of a course of study simply giving the elements of knowledge, the inference is logical that those forms of education which gave direct capacity for higher grades of productive work must be so much the more valuable. In the progress of the concurrent educational movement of that time, looking to the development on the one hand of industrial facility, and on the other to that of artistic power, the commissioner was greatly interested, especially in the Massachusetts experiment of introducing the study of ele-

ART EDUCATION

mentary drawing—essential to both phases of the movement—in all the public schools of the State. This movement was begun in Boston by the well-known educator, long the city superintendent of schools, the late Hon. J. D. Philbrick, in union with the late Hon. Charles C. Perkins,—the latter the leading authority in the city in all matters relating to the fine arts,—and in connection with some of their associate members of the city board of education. Their purpose was to introduce the study of drawing as one of the required studies in the common schools of the city and State. They were fortunate in securing, in 1870, the services of a leading English art master, the late Walter Smith, who was made "art director," in charge of drawing in the schools of the city and the State.

In a pamphlet of some 56 pages (Clarke, 'Drawing in the Public Schools,' Circular No. 2, 1874; Bureau of Education, Washington, D. C.), brief statements of the desirableness of such elementary art training in our American Schools, and of the efforts made by European countries to promote such art training among their people, were given. Especial mention was also made of the English efforts both to develop artistic industries and to extend the teaching of drawing throughout their schools by means of the South Kensington institution. In addition it was sought to give a brief account of such art institutions and collections as were open to the public in the United States; to take an inventory, as it were, of the means at hand for the development of art education in this country. No list of such public art collections existed, and the attempt to secure such a list was undertaken with all the resources of the United States Bureau of Education. The trivial result of all this effort, as shown by the four pages of scattering statistics at the end of the circular, was ludicrous, while the poverty of the United States in art treasures available for the public, as thus exposed, was appalling. The interest taken by educators and the public generally in this small pamphlet, in view of the world's fair to be held in Philadelphia in 1876, in which coming event increasing interest was shown, and its efficacy in securing information, before so difficult to procure, led to the plan of further publications in the same line, and to the preparation by the present writer, as author and editor, of the special report upon the world movements in the development of artistic and industrial education and of like movements throughout the United States, since issued by this bureau in four large volumes. (See Bibliography at close of article.) As there was little literature available concerning this comparatively new educational movement, and none at all within reach of the majority of the teachers of the country, copious appendices were added to each volume of this report.

In view of the marvelous progress in providing educational facilities for art and art industrial development that has gone on in the United States since the publication of the little pamphlet in 1874, I venture to quote from it a couple of pages showing the author's belief in the American possibilities of such development a quarter of a century ago:

While, in the countries of Europe, whatever relates to the people in education, as in other matters, is in the control and general direction of the central government, so that what the central power decides to do

is readily and immediately set in motion throughout the entire country, in the United States there is wisely no such central control. This power inheres to the States and to the local communities within the States. This very circumstance though somewhat, it may be, delaying the adoption of useful measures, yet renders the wise adaptation of training to the peculiar industries and needs of the various parts of the country far more probable. It is readily seen that the kind of special technical training would vary, as it was applicable to a manufacturing, a farming, or a mining community. Indeed, this has already been exemplified in a marked degree in the different developments of the schools of science in the several States, adapting themselves in their chief courses of instruction to the industrial demands of their localities. So we may hope to have in the art future of this country, as have the different European countries, art capitals famous for their peculiar developments, and queening it over their own states, as do Dresden and Munich and Florence, and the other famous homes of art. San Francisco, St. Louis, Cincinnati, Chicago, Cleveland, Pittsburg, Philadelphia, New York, Boston, New Haven, Worcester, and many other prosperous cities and towns may become in time great centres of beauty as well as of commerce, each having its own special development, varying in architecture according to the building material most conveniently accessible, and in art production and artistic manufactures according to their special industries and resources; but all alike affording to their children thorough technical training, and all attractive, because, everywhere, the eye rests on noble buildings; when the homes of industry shall also be homes of beauty, and to walk through the city streets shall be of itself an art education, as of old in Athens, as it was in many a mediæval town, and is still in many an ancient city of France, Germany, Italy, and Spain.

Drawing is the very alphabet of art (for art is but a language), the one essential requisite preliminary to any artistic or technical training; and, if it is desirable that the children of the public schools shall be fitted to become, if they wish it, skilled workmen in any branch of industry, it is necessary that they shall be taught to draw correctly. To those to whom art means higher things, as they suppose, than its application to everyday utensils and mere manufactures; who look for grand galleries of pictures and statues, and to all the higher refinements of cultured art, it may be a suggestive reflection that, among a people ignorant of drawing, and whose daily surroundings, as is true of most of the American people, afford few suggestions of art in any of its forms, high art must ever remain an exotic, and native artists be rarer than the fabled phoenix. A country's art, like all its other developments, must be based primarily upon the characteristics of its people. Where all are judges of art, great artists arise, just as great warriors among nations of soldiers, so that until the common people know the language of art, and can comprehend the meaning of line and color and form, the artist is as much out of place and as little to be looked for as a great author would be among a people ignorant of reading.

Nor has it ever been otherwise. The history of art is the history of peoples. Nor is there anything little or common in the eyes of art. The people that produced great buildings, fine paintings, and noble statues, had also the most exquisite household utensils. Their commonest articles, whose fragile beauty has outlasted the centuries, to-day, with subtle grace and perfect form, tease the eye of the artist and challenge in vain our most skilled artisans to reproduce them. The antique eastern dish of burned clay is held by the modern connoisseur as of more worth than its weight in silver; yet it was once in as humble and universal use as the commonest crockery of our kitchens. Great collections, museums, art galleries, much as they may contribute to the self-satisfaction of cliques and cities, will be of the slightest possible value and barren of results, either upon the industries of the people or their art culture, so long as drawing is not generally understood. Whoever succeeds in having all the public school children of the country properly trained in elementary drawing will have done more to advance the manufactures of the country, and more to make possible the art culture of the people, than could be accomplished by the establishment of a hundred art museums without this training. Just as libraries are worthless to those who cannot read, so are art collections to those who cannot comprehend them; just as all literature is open to him who has learned to read, so is all art to him who has learned to draw, whose eye has been trained to see, and his fingers made facile to execute. We have begun at the wrong end; we asked for art galleries when we needed drawing schools. But the evil is not irremediable. Let drawing be generally taught, and our art galleries and museums, poor as they are, will at once grow more and more valuable, for they will then begin to be of use.

The legislature of Massachusetts, moved thereto by

ART EDUCATION

the persistent efforts of a few cultured and public spirited citizens, who realized the imperative need and demand for such training in the public schools, passed an act in 1870 making drawing one of the studies of the public schools, and also making the establishment of free drawing classes for adults obligatory upon all towns and cities containing over ten thousand inhabitants. In pursuance of this law, Mr. Walter Smith, "art master, London, late head master of the Leeds school of art and science and training school for art teachers," was invited, both by the city of Boston and by the State of Massachusetts, to come from England and introduce the new study into the schools of the city and of the commonwealth. Mr. Smith was highly recommended by the Kensington school authorities. He was appointed state director of art education, and was unremitting in his efforts to introduce drawing into the public schools, and to foster the establishment of classes for adults. Mr. Smith was also appointed general supervisor of art in the Boston schools. He published, in 1872, a large illustrated work upon art education, which is indispensable to a thorough investigation of the subject, and will be found full of practical suggestions to those wishing to introduce the study into the schools.

It is only necessary for the American people to be convinced that a want exists to cause them to supply it. Believing the lack of provision for industrial and general art training in our present system of public education to be such a want, I have sought to show—

First. The need of preliminary instruction in drawing, its utility, and the practicability of its introduction into all grades of the public schools.

Secondly. What steps have been taken toward introducing it and how it can best be done.

Thirdly: The present condition of the means for industrial art training in technical schools, including the schools of science.

Fourthly: The means possessed by our higher institutions of learning for giving general knowledge of art.

Fifthly: The special schools existing for training professional artists.

Sixthly: The steps that have been taken for founding great art museums in connection with art-training schools.

We find that in one State, Massachusetts, drawing has been by law introduced into all the public schools, and a state normal art school established, that in many cities and towns in other States drawing has been more or less taught in the public schools; that in all the "schools of science," where engineering is taught, mechanical drawing is of necessity taught. In schools for the practical teaching of art, as applied to industry and manufactures, the free industrial classes for adults in Massachusetts, the Lowell Free School of Industrial Design at the Boston Institute of Technology, the schools of Cooper Union, the Philadelphia School of Design for Women, and the School of Design of the University of Cincinnati complete the short list. For the special training of artists we have the schools of the National Academy of Design, New York, the Yale School of Fine Arts, New Haven, and the new college of fine arts in the Syracuse University, which comprise all at present existing. The San Francisco school is soon to open. The school of the Pennsylvania Academy of Fine Arts will resume active operations on the completion of the new building. Of the colleges possessing any special collections or facilities for giving any instruction in art, even the most general, we find, excepting Yale and Syracuse, with their special art departments, only Harvard, University of Michigan, Cornell, Rochester University, the College of Notre Dame and Vassar College, out of the hundreds of colleges of the country, that either give any art training or possess any art collection, however small or incomplete.

There remain, then, but the public art institutions which we have already described; there are four of these in the whole land: at Boston, New York, Washington, and San Francisco. The Metropolitan Museum of New York, the Brooklyn Art Association, the Boston Art Museum, the Corcoran Art Gallery, and the Art Association of San Francisco are admirable instances of the methods by which communities and individuals in this country voluntarily provide those institutions for which, in other lands, the government alone is looked to. An important means of art culture, and the only one which has appealed to the general public, is found in the public art exhibitions. To those of the Metropolitan Museum, National Academy, the Boston Athenæum, the Yale Art School, the San Francisco Art Association, and the permanent exhibitions of the Corcoran Art Gallery, I have already referred. It would not be difficult to obtain collections of fresh works of the artists for exhibition and sale in connection with the loan exhibitions of works of art belonging to citizens that have been already suggested. The popularity of exhibitions of good pictures, as attested by the throngs of visitors that attend them and the

crowds that visit the salons of the leading picture dealers in the large cities, who hold perpetual exhibitions in a small way, sufficiently shows the public interest. In art. Indeed, with the multiplicity of American tourists in Europe in these days, it would be strange if the love was not awakened. There are quite a number of well-known private art collections in the leading cities which, separately, would make a desirable public gallery, and from which, as the Metropolitan museum has shown, a loan collection of rare works can be made for public exhibition.

While I have recorded the paucity of institutions capable of giving a thorough art training and the few public art collections now in this country, it is, nevertheless, apparent that there already exists in all the leading cities the material which needs only to be made available, to afford all necessary facilities for general and technical art training, and if it shall be undertaken in earnest, there is possible in this country a development, both in industrial art and in what are called the higher branches of art, which, at the end of 25 years will render obsolete the verdict passed upon us at the World's Fair in 1851 and never yet reversed. Here there is opened a field of honorable rivalry between the several States, cities, and towns of the Union. What England has done in this direction we can do, and the more readily that we have the advantage of her experience. No time or force need be wasted. We have but to adopt and modify the methods so thoroughly tested there to the different conditions that may exist in our several communities. I commend this subject of the relation of art to education to the consideration not only of all educators, but to all who are interested in the varied manufacturing industries of our many States. Skill is the modern secret of success. Science becomes ever more certainly the measure of prosperity. Science underlies and must precede art, it is the strong substructure upon whose fixed foundations she builds her palace walls. In the common schools the children of America must be trained to draw if her artisans are to hold their own in the world's contest, and if her artists are to enshrine her history. If they but will it, the "republic of the people" shall become the home of an art as noble and as enduring as that which glorified the "republic of princes," whose palaces for so many centuries have lifted their stately walls above the waves, guarding for mankind, not the trophies of her warriors nor the wealth of her merchants, but the priceless work of her humbler artists. Tintoretto, Titian, and Veronese are still fresh in men's memories, though the names of doge and patrician have faded from recollection.

In the tables of statistics of "museums of art and archaeology for 1873," given in the circular, there were but 13 institutions in all. Of these the two since reckoned among those having the leading art collections of the country, were but at the beginning of their history. The Corcoran Art Gallery of Washington, D. C., founded in 1869 by the late W. W. Corcoran, Esq., and by him richly endowed, had about 100 paintings, mostly the private collection of the founder, and a collection of nearly 200 casts of antique sculpture. The Metropolitan Museum of Art of New York, founded in 1870, by a few citizens, lovers of art, had but a small endowment, contributed by citizens, and had, in its first modest home down town, as the nucleus of the magnificent and varied collections which now, in 1899, crowd the stately halls and galleries of its majestic palace in Central Park, the Cesnola collection of Cyprian sculptures, ceramics, and glass, and a small collection of paintings, the latter mostly loaned.

In the 25 pages of statistics of art institutions for 1881-2, given in Part I of the special report, are recorded 37 "institutions affording art instruction, including all training in industrial art," and 30 "museums of art." Of these 37 schools, 24 were established in, or since 1869, and of the 30 museums 14 had like dates of foundation. These statistics show the unusual activity then existing in the art development of the people, nor has this ceased; new art institutions are being opened from time to time, either founded by liberal individuals, or by the community, and continual and important additions are constantly being made to the art collections of the several institutions.

The development of popular interest in the new features of education, from 1870 to the opening of the Centennial in 1876, was very rapid, and its progress immediately following the Centennial was surprising in its universality. Up to the time of the Centennial there were, in the United States, literally no books on artistic industries, and few on the fine arts, either published in this country or to be found in the ordinary public libraries. In view of the present abundance here of this class of literature, native and foreign, this statement seems almost incredible; it is, however, strictly accurate. Save occasionally in

ART EDUCATION

three or four of the older cities, there was in the United States, during the first half of the 19th century, little public opportunity for seeing any works of art so that, on the part of the people generally throughout the land, there was neither knowledge of, nor interest in, anything relating to art. The world exhibitions at the centennial first revealed to the great mass of American visitors the wonderful attractiveness and power of art, in creating and shaping the industries of the world. The wide-reaching influence of this world-view upon American educational and industrial development, thus effected by the Centennial of 1876, can hardly be exaggerated. Its beneficent results were charmingly illustrated throughout the Columbian exposition in Chicago, in 1892-3.

In fact, the great eras of that triumphant progress of modern civilization which characterizes our present century, are marked by the splendid milestones of the "World's Fair," beginning with the one set up in London in 1851. A "straw," showing the wide-spreading interest in all matters relating to art, now existing in this country, in marked contrast with the absence of such interest before 1870, may be seen in the fact that in 1899 a book is issued by 'The Macmillan Company, publishers, New York and London,' which gives for the United States and Canada similar information concerning art matters and artists to that which has long been given for Great Britain in their English issue, entitled 'The Year's Art'—a directory of all art schools, museums, etc. The American volume is a handsome, well-printed book, illustrated with 52 full-page reproductions of the works of living artists. The varied contents of this work, when contrasted with the few pages of statistics in the circular of education of 1874, give more striking evidence of the general diffusion of knowledge of and interest in matters relating to art throughout the United States than could be given by many pages of mere description. I have been glad to avail myself of the statistics gathered by Miss Levy, editor of the volume just referred to, showing, as they do, the continued growth and prosperity of the public art institutions. For the 30 "museums of art," as given in the art and industry report statistics for 1881-2, Miss Levy shows, as existing in 1898, 41 "art galleries," an increase of 11, while for the 37 art schools of 1882 Miss Levy records 117. She also gives a total of 159 art societies in the United States and 9 in Canada. No such societies were recorded in the special report. Reference to the United States bureau statistics, as given in the preceding pages, show a notable increase in art collections and schools from 1869 to 1882. The statistics, as now given by Miss Levy for 1898, show most emphatically that the interest in art education and in public collections of the fine arts, as contrasted with that shown by the earlier statistics, is still a growing and continuing interest. The good seed planted in Boston in 1870 has brought an abundant harvest!

Movement for Manual Training—This movement which was so suddenly developed had its immediate origin in the demonstration given by the successful introduction of the new study of drawing in the public schools, showing conclusively that it was feasible to teach at one time, a single subject to a large number of pupils.

The following immediate paragraphs are taken from the opening pages of the introduction to "Part I. of the art and industry report," published in 1885, by the present writer, in which the history of the introduction of industrial drawing in the educational systems of the country is given in detail:

"One of the most striking and significant results of the experiment, begun in Boston in 1870, by the teaching of industrial drawing to the public school children of that city, has been the widespread interest awakened throughout the United States in the further development of the industrial training of children. No sooner was it shown that it was possible to give to the children in the public schools, some elementary training of the hands and eyes, than a movement began in many places, to teach actual trades and handicrafts to the children while in school. Though there might be danger that overzealous promoters of this so-called 'practical education' would in their earnestness, overstep the true province of education, overstrain childish muscles, and overtax the mental as well as bodily strength of the growing children, still the public good sense may be trusted to restrain and modify such extremes; while the intellectual activity, which has been aroused and stimulated by this new departure in education, if wisely directed into practicable channels, can hardly fail of accomplishing desirable results.

"It is referred to here only as one evidence of the rapid progress of the 'evolution' of the principle embodied in the introduction of industrial drawing into the elementary public schools of the country. The practical bearing of this study upon the industries of

the country, is shown in the tendency to begin the technical training of the future workman or workwoman, at a far earlier age than had been before thought practicable. The danger, as already suggested, lies in not recognizing the limitations set by nature. While the kindergarten method avails itself of the natural curiosity and wonderful activity of very young children, and in its educational processes closely follows the leadings of nature; the attempt to teach handicrafts to young boys may very easily go contrary to nature, by imposing tasks unfit for untrained minds and undeveloped muscles. No such objection can, however, be against the study of industrial drawing. Weak indeed must be the hand that cannot lift a pencil, weaker the mind that, beginning at the beginning, cannot follow the graded and orderly steps, by which Walter Smith, basing his teaching on the everlasting truths of geometry, has arranged his progressive studies.

"When the study of drawing is regarded in all public schools as of the same importance as the study of reading and spelling, and as much time in the week is given to teaching drawing, as is given to either of these studies—which has nowhere yet been done, for even in Boston this study has been admitted largely on 'sufferance'—then, judging from the results already secured, it is reasonable to anticipate an increase in the numbers, as well as superior expertness in the skill of American-born workmen. It is by reason of its direct bearing upon the development of skilled labor that this subject of the introduction of the study of elementary drawing based on geometry, and with a direct view to its application to industries, is of the national and general importance which seems to justify the preparation and publication of the present report. Accounts of the experiments in introducing 'manual training' in the public schools, as well as the reports of the special schools for such training and of the technical industrial schools will be found in their appropriate connection in Part II. of this report. The passage by Congress of the law establishing the 'colleges of agriculture and the mechanic arts' as long ago as 1862, is proof that the need of some form of educational training, other than the purely literary courses which then comprised all that was given in the higher schools and colleges, was widely recognized.

"A knowledge of drawing is so essential to any progress in many of the studies comprised in the regular courses of the schools of science that, in view of the almost total neglect at that time of this study in the public, or private elementary schools, it is little wonder that when the new colleges, created by the national land grant act, were first opened, there were frequent complaints that, for want of this indispensable preliminary training in the element of drawing, nearly a year's time was lost in teaching the pupils that which should have been taught in the primary schools. While there were doubtless other studies in which a lack of suitable training was observed, drawing was both the most important of these preliminary studies, and the one in which deficiency was most common and most disastrous. It is because this knowledge is indispensable as a preparation for the courses in the schools of science, that the teaching of the study of drawing in all the public schools of the country is of importance to the colleges created by the national land grant of 1862, and it is in this connection that one element of the practical value and importance of this training of the public school children in elementary drawing can be readily seen. The public schools are the academies that fit the students for the national agricultural colleges, and, therefore, it is of importance to these colleges that the studies taught in the public schools shall be such as are preparatory to their own courses of study."

The origin of the educational form of manual training, as introduced in the public schools of the United States, and as presented in the technical and manual training schools, is by some definitely assigned to the year 1876 as being the direct outcome of the object lessons of the "work in metals," shown by the Stroganoff school in the Russian exhibition at the Centennial. The work of this Russian school was enthusiastically set forth to educators by Prof. Runkle of the Boston Institute of Technology, and by Prof. Woodward, since director of the Manual Training School of St. Louis. Several other educators, interested in industrial education, as shown in the exposition by the work in wood in the Swedish department and by other like experi-

ART EDUCATION

ments, heartily favored the movement. This movement is, in the opinion of the writer, simply the logical outcome of the experiment of introducing instruction in industrial art drawing in the public schools, initiated by the calling of Walter Smith to Massachusetts in 1870. It is, therefore, germane to the purpose of the report, although not solely artistic in its present development.

Drawing in American Schools.—The beginning of the modern art educational movement in the United States can be definitely assigned to the year 1870. By a melancholy coincidence which groups the termination of the lives of the three remarkable men by whom this great educational reformation was begun, within a few short months of each other, the close of the first period of this movement, destined to exert immeasurable influence over the future of America, can be fixed as in 1886. In common with Dr. Philbrick and Mr. Perkins, Prof. Smith regarded the introduction of industrial art drawing in the schools as but the beginning of the movement for the industrial art education of the American people, as his published addresses testify. The great movement in the United States which these three men definitely organized, and of the development of which they had a far-sighted, comprehensive view, may be said to have already fairly entered upon the second period of its development, no longer by any means confined to the public schools. It is because all training in industrial education that can be given in the public schools as they now exist, or in any new class of schools that may be established with that direct purpose, must, of necessity, be based on the thorough grounding of the pupils in the knowledge and practice of elementary industrial art drawing, of like character with that first successfully taught in the public schools of Massachusetts under the directorship of Prof. Walter Smith, that the present widespread movement is termed a second step in the new educational advance.

What these three men in Massachusetts did was to demonstrate beyond cavil, that it is as possible in the same time to teach a subject, by means of drawings and objects shown and explained by a teacher to a class, to many pupils simultaneously, as it is to teach the same thing to a single pupil. The effect of this discovery was at once to multiply indefinitely the power and capacity of the public school. For not only was this true of instruction in drawing and in writing, the studies which before had been thought to need particular devotion of the teacher to the individual pupil, but it was found applicable to many other studies and to afford great facilities to teachers in illustrating many topics.

If industrial art drawing had no other value than to have furnished this proof of the facility of general instruction to classes, instead of to individual pupils, it would have fully justified all the cost of its introduction in the schools in money, time, and effort. Much besides this was effected by the proof that the study of industrial art drawing demanded no special faculty on the part of either pupil or teacher, but could be taught to all by the regular teachers of the schools after a little preliminary training of the teachers themselves in classes. It was long before the popular impression that drawing merely meant picture-making, and that the ability to

draw was a special gift of genius, could be corrected; but this was gradually effected by repeated public exhibitions of the work done by all the pupils of a school, or of all the schools of a town or city, where it was shown that every child whose eyes and fingers were uninjured could learn to draw. The object of the study, which was to train the eye and the hand—the one to accuracy of seeing, the other to facility of execution and exactness of statement—began slowly to be understood. The value of a thorough training in industrial art drawing has at last become so generally recognized as to call for little argument. It is taken for granted in the discussions about the further development of industrial education that the pupils have been taught the elements of drawing, just as, in discussions about new text-books, their ability to read is assumed. It was far otherwise in the beginning. All through the early years of the decade, from 1870 to 1880, there were very few individuals, and fewer school officials in cities and towns, who were in the least aware of the usefulness of this study. The very places in which the most zealous advocacy for manual training in schools, and for the adoption of all forms of industrial education is now found, were only, after long-continued efforts, led to allow the experiment of teaching drawing in their public schools to be tried. However, the Centennial exhibition in Philadelphia in 1876 worked wonders in the general diffusion of a knowledge of the possible value of this industrial art education; for the American people then first saw into how large a share of the manufactures and arts of mankind this application of art to material enters; first learned how values were enhanced by art, and began to realize how art ennobles labor.

They saw also at Philadelphia, in the collections shown there of the industrial art drawings made by the school children of Massachusetts, by what methods, and with what results, the teaching of this new study could be effected. More than this, the pupils' work in applied mechanics, shown by the Russian schools, illustrating the results of giving definite instruction, in a systematic course to artisans, was there first seen and the idea of the "manual training school," since so admirably exemplified in the St. Louis and the Boston schools, modeled after the Russian plan, was familiarized to American educators. Thus, the sure foundation for a further advance in the development of industrial education was laid.

As soon as the success of this attempt to begin the elementary training of the eye and hand in the public schools was satisfactorily established, it was evident that a new and valuable means of education had come into use. Educators eagerly adopted and experimented with the new methods, some looking at them only with a view to their application in the art of teaching their pedagogic value; others, the majority, seeing in them the means of giving a more directly practical turn to the training in the public schools. The demand for this more practical education has been rapidly growing, and in these new studies were found the first practical suggestions for so modifying the old methods of school education as to adapt them to the new demands. In common with all germinal ideas, they were found capable of various applications and of indefinite development. It

ART EDUCATION

was the recognition of this potentiality that led Dr. Philbrick and Mr. Perkins to desire and secure their introduction. When it is seen how truly the present interest in industrial training is the legitimate result of the introduction of industrial art drawing in the public schools of Massachusetts, and that, but for this pioneer work in thus clearing the way, and laying the sure beginnings of general technical training in this country, the great Philadelphia exhibition must have failed of any direct practical bearing upon our education, or our industries, other than to greatly stimulate the buying of foreign art manufactures; the magnitude of the services rendered to the whole country by the three men who originated the plan and effected the introduction of the practical study of industrial art drawing in the common schools of Massachusetts in 1870, begins to assume larger and grander proportions. That the practical value to the people of the United States of the opportunities afforded by the splendid displays of their art industries by the nations of the world at Philadelphia, was greatly enhanced owing to the direct interest in industrial art training, begun in Boston six years before and rapidly developing in Cincinnati, St. Louis, and elsewhere, may safely be assumed; because the industrial value to a people of the sight of such varied museum collections as were shown at the Centennial, is not mainly derived from the pleasure given to the mere sight-seer, but is owing to the opportunities thus afforded to practical designers and artificers for thorough study of the works shown; for, as Emerson sagely says, "No matter how much facility of idle seeing a man has, the step from knowing to doing is rarely taken." It was in this exhibition that the utility of such training in the artistic industries was first made known to large numbers of Americans; it was here, also, that the methods of successful teaching in the elements of these arts were first shown to the whole country. It is of interest thus to be able, sometimes, as in this instance, to trace great results to their causes.

This movement was the true dawn of the new era of the industrial art development of America, which was apparently ushered in by the Centennial exhibition; nor, if the movement, which has gone steadily forward from those early days in Boston, meets with no unforeseen interruption, will the term "era" seem inappropriate. That the purpose of the early promoters of the introduction of the teaching of drawing in the public schools of the country was to develop and promote the knowledge and love of art throughout the community may be inferred from the fact that, in the same year that Walter Smith, himself a sculptor by profession, was brought to Boston, Mr. Charles C. Perkins,—at whose suggestion some two years before the American Social Science Association had sent to Europe for a number of casts of classical statues and busts to be placed in the new building of "The Newton Street Girls' High School,"—superintended the placing of these works of high art in position; the architect having provided for them in his plans. The purpose of this collection was two-fold, both to provide fitting decoration for the building, and "as a simple but efficient means of introducing an aesthetic element into the educational system of the United States," by offering to the pupils an opportunity to see and comprehend some of the works of the great

masters of art. With this intent, Mr. Perkins, himself an acknowledged authority on all matters relating to this subject, gave to the fortunate pupils of that school a series of lectures on classic art as exemplified by the works before them. This collection comprised casts of 10 famous antique statues and 11 busts. In addition to these single examples a portion of the wonderful frieze by Phidias, from the Parthenon, was put in place on the walls. The Museum of Fine Arts, though incorporated in this year of 1870, was not opened for several years; so that the casts of the girls' high school collection comprised the most of the works of classic art then accessible to the public in the city.

This, then, seems to have been the first instance in this country of the definite undertaking of the artistic adornment of the interior of school buildings, though for many a year, here and there, in some wayside country school-house, a few wild flowers, or garden posies, brought by some loving scholar to the youthful teacher, and set in honor upon her desk for all to see, had given unwonted charm and color to the dingy room, with unconscious suggestion of the beauty waiting to transform, at a touch of the magic wand of art, those too often repellant dens of ugliness, the common school rooms of the country, with their desolate, naked walls, into bright, attractive homes for the happy children; such as are to be found to-day in city and town, and along country hillside all over the land.

As the origin of the present somewhat widely extended movement for beautifying the school rooms, has been attributed solely to the movements begun in France and in England a decade later (see report of Boston school committee on drawing and music for 1883) — it has seemed well to refer here to the inauguration in 1870, of this earlier Boston idea of placing examples of antique art in the school. (For a full account of this Boston experiment, and of other later similar efforts elsewhere, as well as for several papers of interest in this connection, see chapter I of Part II. 'Art and Industry Report,' pages 1-11 of Appendix 'K,' Part II., pages 709-731.) Mr. Perkins and his associates sought to give to the young girls, many of them about to become teachers in their turn, some definite knowledge of classic art, so that not only should they see for themselves these objects of ideal beauty, but that all literature should be thus for them illumined—since the literature both of Europe and America springs so largely from that of Greece and Rome. The cost of such a collection of casts of ancient art would preclude any such undertaking in most schools, public or private, but fortunately beauty is not to be held a captive, even in golden chains, and, just as the cheaper plaster casts, as in this instance, take the place of costly marbles and bronzes, so engravings and photographs afford admirable and inexpensive reproductions of plastic and pictorial art; while in our large cities are now publishers who make a specialty of providing such artistic illustrations for the use of students, or for the adornment of the study walls, and the halls, and assembly rooms of the schools, adapted to all needs and to all purses. However, unless the living teacher shall bid these dry bones of art to live, shall unseal the closed eyes of the children so that they can recognize their beauty, and shall awaken their eager curiosity to learn the

ART EDUCATION

meaning and the message of these silent ministers of art, they will fail of their mission.

The initial movement in Boston, in 1870, for artistic adornment of school rooms, as well as for the art instruction of pupils, was soon followed by similar undertakings in some of the neighboring towns and cities of Massachusetts; and later when the English and French movements became generally known, in many places all over the country. In New York, Brooklyn, Providence, New Haven, Philadelphia, Chicago, Milwaukee, Denver, San Francisco, and doubtless in many other cities the movement has made good progress. Long since, in Baltimore, in the Maryland Normal School building, under Supt. Newell, and in Washington, D. C., in the Franklin School building and the high school building, under Supt. Wilson, many artistic works had been placed in the halls and school rooms, which are constantly added to, under the supervision of their successors. In Boston, in November, 1894, and was held under the auspices of "The Public School Art League," "The New England Conferences of Educational Workers" and "The Boston Art Students' Association," a fine exhibition of works suitable for school-house decoration, and in Brooklyn, N. Y., in the spring of 1896, a similar exhibition in charge of the art education section of "The Brooklyn Institute of Arts and Sciences." This direct outcome of the movement for industrial art training in all public schools, and inspired by the same leaders, may serve to show that the art idea was ever in the plan of the founders of this important movement, which, unfortunately for awhile, was in great danger of being wholly divorced from any idea of art.

The Boston movement for putting the study of drawing into the regular curriculum of the public schools attracted the attention of educators all over the country, and during his first year in Boston Prof. Smith was invited to attend the convention of State school superintendents held in Washington, to explain the nature and purpose of the innovation of which he was in charge. The strong personality of the man impressed all who listened to his impassioned pleadings and aroused a contagious enthusiasm, so that even before the showing of results at the Centennial in 1876, the fundamental principles of the movement were well known throughout the educational centres of the public school system of the several States of the Union.

This failure of the art idea in the manual training schools is so evident that some of those who started enthusiastically with the industrial art drawing movement, but were led away by the more sudden popularity of the industrial training movement to the hearty indorsement and support of the latter, begin to realize the evil they have helped to bring upon the most hopeful educational movement ever begun in these United States, and feebly point to a single manual training school in which—thanks to the fact that the superintendent of that city was one thoroughly in touch with Walter Smith, and had mastered the underlying principles of art training which inspired the teachings of that great master—some reachings out for æsthetic culture are indicated, as the ground for their hope that in the future art training in manual training schools "must come as a necessity!" So, for

ages, men have pointed forward to some anticipated millennium!

Neither in the theories, wishes or methods of the people who most actively advocate the manual training movement can the present writer see promise of any valuable development or training of the æsthetic nature of the public school children of the United States.

"The 'industrial training' and 'manual training school' advocates are entitled to much credit for what they have accomplished, and there is much of value in the work they seek to do; but there is no evidence that they comprehend, or desire, any such art training as Messrs. Philbrick, Perkins, Smith, and their wise and enthusiastic coadjutors hoped to add to the educational forces of America.

"Had these three men been spared to instruct and to inspire, it seems possible that the hopes they aroused might have met fruition.

"The prolonged study of these schools, as well as of the arguments of manual training advocates, incident to the preparation of this volume, has led to the reluctant conclusion that, however desirable the development of art among the American people may be, no such development is directly, or indirectly, to be anticipated from the efforts of the advocates of industrial education; while the methods of the manual training schools are, of necessity, mostly occupied with the kind of drawing specially adapted to mechanical processes."

As stated, the general awakening of interest in the educational industrial possibilities caused by the rapid extension of the movement for the adoption of drawing as one of the required studies in all public elementary schools, had a marked tendency to eliminate the art idea. So little was the knowledge of, or interest in, art in any community, that the first advocates of drawing, though, as has here been clearly indicated, they valued the study chiefly for its relation to the arts, spoke to the public mostly of the industrial value of drawing, seeking thereby to recommend the new study. The enthusiastic efforts of the advocates of drawing, the remarkable personal influence of Prof. Walter Smith, the showing made at the Centennial exposition of the successful work of the students of the Boston Normal Art School, and of the work of the Boston school children, gave a great impetus to the development and spread of the industrial art movement throughout the country, so that it seemed to be on the point of complete success, and of being adopted in all the public schools of the States. Suddenly, however, a change came. After 12 years of devotion to his important work of supervision, Mr. Smith resigned as art director of the State, as principal of the Normal Art School, and as in charge of the art training of the Boston public schools, and returned to England. The marked change that followed in the direction of the educational movement from industrial art training to manual training and the teaching of trades, was doubtless due somewhat to the general indifference to art felt by a large part of the public; but, more largely, to the failure of intelligent support of the art ideal, due in part, as suggested, to the return of Walter Smith to England—driven out by antagonisms, but in a greater degree to the almost simultaneous removal by death of the able early

ART EDUCATION

promoters of an art purpose in the study. To the concurrence of these lamentable events may fairly be attributed the almost total eclipse of any art idea in the study of drawing which for a time prevailed. At this period the purpose which inspired the early promoters of the new study of drawing seemed hopelessly lost in the new-born zeal for mechanical drawing as relating only to "manual training"—to making things; and to the preposterous, though popular idea of graduating from the public schools boys of 14 and 18 years of age as thoroughly trained expert mechanics. The simplest principles of educational and technical industrial standards are alike violated by such claims and endeavors. The claim that the simple mechanical processes can be taught; some knowledge of the use of tools acquired, and much given that will serve to prepare the boy for the subsequent technical training which is essential to his success, but suitable only to one of added years and maturer physical development, is perfectly tenable; so that manual training, as elementary preparation for the technical study of future life-work, or, as giving some desirable general knowledge of mechanics, is to be warmly commended and encouraged, but it is not to be taught as antagonistic to the elementary instruction in drawing, the alphabet of art as well as of mechanics. It is an evidence of the common sense of the community that such waves of feverish interest in educational experiments are but of short duration. Inevitably somewhat later the new study, which at first was to revolutionize all former educational theories and methods, gravitates to its proper place in the general scheme of education, according to its proved relative importance. So, within the past few years, a reaction has come in connection with the public schools, and the art quality of drawing is again recognized. It is to be hoped that the essential difference between the educational value of a study as a method of developing and stimulating the intellect, and that simple iteration of thought and movement, essential to the production of technical facility in mechanical operations, will not again be lost sight of by the educators or the public.

In 1870 it was evident to all intelligent observers that the one element absolutely lacking in all American education was the æsthetic. Art as an essential feature of education was unknown. It is true that the literary arts, poetry and oratory, received some little attention in the higher institutions, and that instruction in elementary music was not wholly neglected in the public schools; but, so far from any attempt to give even the most cursory knowledge of the graphic and plastic arts, being made generally in the higher educational institutions of the country, they were simply ignored, while æsthetics were only thought of as forming a subordinate branch of metaphysics. This absence of any knowledge of, or training in, the fine arts, held true in all American public educational institutions, from the district school to the college. There were then no true universities, though several small but ambitious colleges were encumbered by the grandiose title. While this statement as to the absence of any general opportunity for seeing examples of the fine arts, and as to the lack of any attempt to give a knowledge of the arts of painting and sculpture in the public schools and other public edu-

cational institutions in the United States is not exaggerated, it is nevertheless true that the fine arts were not wholly ignored in America, and that, as early as the latter part of the 18th century, the names of some few American artists were known to the world, while early in the present century efforts were made by a few people of culture to establish art centres in several of our cities. Facts relating to the early history of these sporadic efforts to form art academies and public art collections, have been most eagerly sought and collected for educational department reports. These interesting histories will be given in Parts V. and VI. of Art report. In view of the later developments, especially of the growing general interest in, and knowledge of, art matters since the beginning of the movement in Boston for teaching elementary drawing in the public schools, and the vastly greater impulse to public interest in everything pertaining to art, given in turn by the holding of the Centennial and the Columbian expositions, the story of these early efforts acquires added interest. To the self-denying efforts of a few artists and art enthusiasts were suddenly added the enthusiasm and the active support of an awakened public.

In view of the many collections of casts of antique sculpture, and of the private and public art galleries, rich in examples of the work of the leading modern artists of Europe and America, which, as the result of this "awakening," are to be found in the United States in the year 1898, and of the special art classes and art schools now in our cities, with the very general interest shown in the literature of the arts; and further, in view of the present easy access by the public to the before-mentioned art collections, the statement concerning the scarcity in America, as recently as in 1870, of similar opportunities, would seem almost incredible. It is, nevertheless, the fact that, at that date, there were but four or five small collections of casts of classic sculpture in the whole country. Boston, New Haven, New York, Philadelphia, and Washington, had each a few examples of such casts; but all the casts of sculpture then in the country, both in public and private possession, would not equal in numbers or value, the casts now possessed by the leading art museum in any one of these cities; while in towns, cities, and colleges all over the land are to be found valuable and interesting collections of casts and paintings. There were then but eight colleges which gave any instruction whatever in art, or that had any collections of art works, while there were but five public art museums in the whole land. The Centennial exposition in Philadelphia, in 1876, was a revelation to the American people, not only of the glory of the graphic and plastic arts, as shown by the world's great living artists, sculptors, and painters; but also of the variety and beauty imparted to articles of usefulness and ornament by the wonderfully artistic weavers, potters, and metal-workers of the Orient, and by the skilled art workers of Europe. The increase of such opportunities since 1883, by the opening to the public of similar facilities for art culture, both by the founding of public art galleries, the making of private collections of art, and the general dissemination of information on all matters relating to the arts, by the press, and by lectures and addresses, have been no less remarkable, stimulated as all this

ART EDUCATION

interest has been by the holding of the exhibition in Chicago, in 1892-3; for, wonderful as were the revelations of the Centennial, to the public of 1876, the marvelous showing of the Columbian exhibition, or world's fair, at Chicago, in 1892-3, completely overshadowed them. In this latter exhibition of the world's industries and arts was shown not only the striking advances made since 1876 by all the world, in every field of human activity, knowledge, and enterprise, in art and industry; but also more impressively if possible,—at any rate more significant educationally,—than these myriad treasures from all the earth, was the revelation of the marvelous beauty of that white city by the inland sea; with its classic peristyle worthy of the Athens of Pericles and Phidias; its lofty pillared fronts and swelling domes—its vast palaces stretching in seeming endless procession. The beautiful transitory treasure houses America had built for the world's richest offerings! These stately structures—which filled every beholder with wonder and delight—proclaimed to the world that, in the intervening years following the Centennial, the young nation of the West had given birth to a race of great builders—architects, sculptors, painters, and decorators, worthy to rank with the world's worthiest. As the American architects had, as a body, early undertaken to secure thorough training in that art for the young men aspiring to enter their profession, this demonstration of the grand results of thorough artistic training in architecture and its kindred arts was in the nature of a triumphal verdict in favor of definite education—of special training—in art, as well as in science, or in the so-called "learned professions." Thus, while these temporary buildings by their variety, fitness, and beauty of proportion, won the admiration of all beholders, they were in fact but a great object lesson, illustrating on a gigantic scale what education in architecture, art, and artistic decoration could effect. The noble building of the Boston Public Library, since erected, and the stately marble palace of the National Library so recently opened in Washington, are enduring monuments, showing what the art of American architects, builders, sculptors, and painters can accomplish, in these closing years of the 19th century, in the construction and adornment of a great public library. The exterior walls and sculptures of the National Library, the interior halls and grand stairways, and above all the profusion, variety, and general excellence of the sculptured and pictorial art works enriching walls and ceilings within, remind us that we are, even now, in this 19th century, living in the years of that "renaissance" which did not pass away, as we once thought, with the passing of Angelo, Raphael, De Vinci, and their peers, but which is still vital with inspiration; so that here, on this to them unknown continent, opportunities are beginning for the future art masters of the world. When Hunt painted his two great allegorical pictures on the walls of the legislative chamber in the State capitol at Albany, that great artist "builded better than he knew," though, alas! his own work so quickly passes; for, by that single precedent, he opened up all wall spaces of public buildings to the future artists of America; so that hereafter, in this land, it shall be held—just as it was in Europe centuries ago—that the walls and ceilings of all

palaces, churches, and other public buildings are to be considered but as the durable canvas of the painters.

That "rebirth" of the past, which came with the discovery of a few of the art wonders of Greece, occurring almost simultaneously with the regaining of some of the intellectual glories of Greece and Rome, in the unearthing of a few manuscripts which gave to us moderns a glimpse of their glorious intellectual triumphs—as yet unsurpassed and seemingly unsurpassable—gave to our conception of the capacity of the human intellect a new ideal, and woke the world to life! What the wonders of the classic age, in art and literature must have been we can faintly imagine, contemplating the works of the intellectual and artistic giants of Italy in the Middle Ages, who sprang into being at the magic call of a few scattered fragments of the words and works of the mightier ancients; just as, in Holy Writ we are told the chance touch of the bones of the prophet Elisha woke the dead to life! So, to-day, as Homer, Æschylus, Demosthenes, Aristotle, and Plato, dominate the world of letters in poetry, eloquence, and philosophy, Phidias, Ictinus, Appelles, and their compeers, lead the worshippers of art.

In art, in our own day, have been repeated similar discoveries to those which in literature, four centuries ago, aroused to new activities the mind of Europe; for the revelations of Etruscan tombs, the patient explorations by Layard, Schliemann, and Di Cesnola, the unearthing of the terra cotta figurines in Tanagra, the later work by English and American enthusiastic scholars in Greece, in these very days, have brought home to us moderns a comprehension of the vitality of classic art; which, contrary to our earlier impressions, we now find to have been busied not only with the ideal images of the Olympian divinities, but also with the everyday life of the people, all testifying to the solidarity of the human race; for, quickened by the life-giving touch of their artists in those far-off centuries, the little figurines of the graceful maidens of Tanagra reveal, in their unconscious attitudes, the same love of dress, the same delight in free movement and flowing robes,—in short, the same irrepressible joy in life, and the same marvelous beauty of youth which meets us to-day on every hand, a-foot or a-wheel, in the blushing maidens of 16 years in this fair land, the unknown "ultima thule" of the ancients. So past and present meet and blend, taking no thought of the thousand intervening years. Here to-day, the thought, the art of Athens and Rome shape our thoughts and arts; so that we consciously or unconsciously are the children of that elder civilization. The most recent illustration of this influence of classic examples upon our modern American art ideals, to which reference has been made, occurs among the buildings of the exposition held in Nashville, Tenn., in the summer of 1897, where the crowning architectural charm is found in the striking restoration of the Parthenon of Athens, which is the model taken for the art building of the exposition. This reproduction is spoken of as full of grandeur and beauty.

It is also remarked that the government building erected for showing the governmental exhibits has, fortunately, been modeled after the Chicago exhibition art building; so that, instead of being externally, as was the one at Chicago,

ART EDUCATION

a hideous enormity, in contrast with the artistic buildings surrounding it, this copy in little of the beautiful construction designed by Richard M. Hunt for the art building of Chicago, is not out of harmony even when brought into contrast with the world-renowned *chef d'œuvre* of Ictinus and Phidias. This is all the more to be rejoiced in because it began to seem that, under the stress for room in our modern cities, all ideas of beauty in architecture must, perforce, be wholly subordinated to the frenzy of piling stories upon stories, till the builders seemed to have no ideal other than that of the Tower of Babel.

This epidemic of many-storied buildings has had a most unfortunate effect, in many instances, in degrading the architectural aspect of our older cities. Perhaps some of the most striking examples of this incidental evil, are to be found in the city of New York, where the ever beautiful old familiar landmark of Trinity church steeple has been eliminated from the once attractive view of the city as seen from the bay. In addition to this misfortune must be reckoned the recent belittling of that charming example of palace architecture, the New York city hall, formerly so well shown standing as it did in the ample open square given to it in the heart of the town, now, seeming as if at the bottom of some mountain valley, towered over by the clustering cliff-like business buildings that crowd about the square, shutting out all views save of their own precipitous walls. In Washington, an impertinent modern apartment house, towering in apparent emulation of the Washington monument, obtrudes its awkward outlines and gigantic bulk in every possible view of the capital city, once so beautiful as seen from every point of vantage and uglifies it all.

In some at least of the cities of Europe the observer can hardly fail to notice that, while the residences and business buildings in the streets of the city may make no pretense to any display of architecture—often being noticeable rather by reason of excessive plainness—care has been taken to secure for the public buildings of Church or State—the cathedral and the civic palace—ample space, where no private erections could ever destroy the harmony of proportion, or impair the true architectural effect of the building. In this country, notably in the very instance of the New York city hall, this effect was supposedly secured by the generation who built it only to be thrown away by a later generation of ignoble or careless successors. In the situation of the capitol building of the United States in Washington, D. C., and in those of the State capitol buildings in Albany, N. Y.; in Boston, Mass.; in Hartford, Conn.; in Nashville, Tenn., and in many another State capital, the sites are commanding.

The choice of the situation for the cathedral of St. John the Divine on Morningside Heights, New York, is most fortunate. It is architecturally isolated so that no such misfortune can affect it as has recently relegated Trinity Church and the city hall to comparative obscurity.

It is with this thought that the foregoing pages have been given to the brief summary of the recent remarkable development of the fine and decorative arts in connection with the forward movement in the architecture of public buildings, so strikingly illustrated in the recently erected library buildings in Boston and Wash-

ington. The Chicago Public Library, though on a smaller scale than the libraries at Washington and Boston, and in further contrast, making larger use of merely decorative marbles in wall surfaces than of the work of the artist painters, is nevertheless unmistakably of the Renaissance period.

The wonderful wealth in decorative carvings and grandiose stairways in the State capitol at Albany, suggests some of the undesirable features of the later renaissance, in which in the interiors, costliness of material and work, seemed to take the place of artistic inspiration; while the ostentatious piling up of costly stone exteriors, suffocated all efforts of living art. A heathen apotheosis of mere material wealth, against which Gothic art was a religious protest; and concerning which John Ruskin has so earnestly and eloquently warned the men of his own day. Coldly inhuman, these towering piles of quarried stone, frowning above our city streets, seem as menacing as hostile fortresses.

The grand marble stairway of the capitol building in Albany, designed by Richardson, and said to be the most beautiful and costly example of elaborate carved work in the country, which has taken more than 12 years in its construction, seems to repeat, in the lavish profusion of its carving, something of the extravagance of the later renaissance. It is due, however, to the architects of this great building, Messrs Fuller, Eidlitz, and H. H. Richardson, to state that its exterior in nowise recalls the characteristics of those ostentatious buildings referred to; while it is well to remember that, if anywhere profusion of art decoration is fitly employed, it is in enriching and dignifying the important public buildings designed for the uses of the people. In considering this particular people's palace, all who love art must ever remember that it was in this building, as has already been here stated, that William M. Hunt, the great painter, set to the American artists and builders of our time the striking lesson of noble art decoration so fortunately followed in the great public library buildings just completed.

In the zeal of this new awakening on the part of American architects and their employers to a practical recognition of the value of art in the decoration of the interior wall surfaces of public buildings—the most recent examples of which I have instanced—it should not be forgotten that, decades before these later buildings were planned, those who had charge of the construction of the grand building of the nation's capitol at Washington had freely availed themselves of the works of the American painters of their day, beginning as early as 1837, to illustrate memorable and pivotal events in the history of the republic; so that, on entering the grand rotunda, the visitors found themselves encircled by a series of large historical paintings, of a size in harmony with the colossal proportions of the encircling walls which supported the upspringing arches of the crowning dome; while in the dome itself, in a blaze of allegory, dear to the heart of Italy, was given the Italian artist's conception of the great powers essential to the prosperity of a people, and, though diplomatically disguised in appellation, a glimpse of the crowning triumph of the nation in its latest terrible struggle for existence. From the landing of Columbus to the coming of Lincoln,—

ART EDUCATION

he who runs may read in the paintings, the bas-reliefs, and the encircling frieze, "*in tempera*" — (though little can be said in praise of the artistic excellence of the reliefs and the frieze) — the dramatic events of the centuries which have resulted in giving to the world the republic of these United States of America.

Our legislators called not only on the painters, but also summoned the sculptors to the adornment of this, the chief building of their country; and gradually important works by Greenough, Powers, Crawford, and Rogers were secured. In addition to these works by native artists, the services of Italian artists (Bermudi and others), as decorators, were largely availed of in the dome, halls, galleries, and committee-rooms of the building; while in the wings, occupied, respectively, by the legislative chambers of the House of Representatives and the Senate, later American artists have added many fine works illustrating the history or the scenery of the country.

It has been a fashion with many writers, posing as art critics, to speak contemptuously of the historical paintings in the rotunda. However true their criticism may have been, if comparison of these paintings with the *chef d'œuvres* of the world's great artists — Titian, Tintoretto, Veronese, Velasquez, Rubens, and other great art masters in historical painting, either in their conception of the subject or mastery of technique, are concerned; it should not be forgotten, in endeavoring to estimate the value of this art work to the country, that a half century or more ago few American citizens who entered that building had ever before had the opportunity to look upon a fine work of art of any kind. It followed, therefore, that the sight of that grand rotunda, with its uplifting dome, its great paintings, was an event never to be forgotten; and the grandeur and inspiration of the scene gave to many their first realization of the meaning, the power, and the possibilities of art. There have been American artists, before and since these works were painted, who justly rank as artists far in advance of Trumbull (though few have left works which can surpass in brilliancy his small, jewel-like originals of these large paintings, long the pride of the Yale College Art Gallery), Weir, Chapman, Vanderlyn, and Powell, the painters of the works of the rotunda; but it may well be questioned whether, before 1870, any other American artists have given to so many of their fellow countrymen their first appreciation of something of the glory of art.

A debt of gratitude is due to the legislators who authorized and the artists who executed these works. Nor, taken as a whole, are the art adornments of this, the noblest legislative building in the world, inferior to those of similar modern public buildings in European countries. Art in the early part of the 19th century, so far as shown in statuary on the exterior of buildings, was in nowise generally superior to the grandiose sculptures by Persico, which stand in the east portico of the rotunda; while the group by Greenough is far superior to the ordinary statuary of that day. Nor in painting was Trumbull so greatly inferior to his master, West. In fact, the era of the reign of the fourth George of England, and his immediate successor, was nowhere in Europe memorable as illustrating the highest ideals of art. Early in this century

America had, in Allston and Stuart, art masters equal to their contemporaries of any other nation.

In view of this long-continued example of the possibilities of the artistic use of interior wall surfaces, as shown by the pictorial illustrations in the rotunda, of the history of the country, by well-known artists; and, also, by decorative paintings on minor wall spaces which adorn the interiors of the nation's capitol building; the fact of the almost entire absence throughout this period of similar wall paintings and decorations in other civic public buildings in the land, as well as in churches and private dwellings, so that the paintings by Hunt in the State house at Albany can be accurately designated as marking the definite beginning of the present era of the general artistic interior decoration of buildings, civic and religious, public and private; — furnishes a convincing proof of the utter lack, on the part of the American people as a whole, of any general knowledge and appreciation of the value of art in its application to the buildings, and the furnishings of life, prior to the holding of the Centennial exposition in Philadelphia in 1876.

It may well be urged that, up to that time, this busy people were too fully occupied in completing the physical conquest of a vast territory; in subduing forests, bridging streams and opening virgin prairies to cultivation; in providing for the transportation, housing, and feeding of the ever-surging incoming tides of eager emigrants; were in short too busy in their imperative task of *making* history to find time or thought for its artistic record. When at last they found time to pause and study the lessons of that Centennial, they proved apt students; as the Columbian exposition has shown. Yet notwithstanding this later surprising and artistic evolution of the American people, so widespread and rapid has been the development of technical training in its application to industrial and fine art manufactures throughout the leading countries of the continent of Europe, and also, though begun later, in Great Britain, that, although the development in elementary artistic training and its facilities for the acquisition of advanced instruction in these arts in the United States has been wonderfully increased since the beginning in Boston in 1870, of the movement for school instruction in drawing, and the holding of the Centennial exposition in Philadelphia in 1876; still, in the opportunities offered for the training of skilled youthful workers in the industries of applied art, the United States to-day — in view of the persistent efforts and great advances made during the past 20 years, by European countries in providing such educational facilities — are relatively hardly in any better position to contest successfully with the products of the trained workers of Europe than they were in 1870.

Nevertheless the efforts made in this country by leading educators, and by liberal patrons of artistic and technical education, have been notable and most worthy of honor; while the great advance since the Centennial, as shown in the art qualities of American manufactures, in jewelry, in glass, in art fabrics, in silk, in woolen and in cotton, as well as in architecture and in all material pertaining to the decorative arts, has been simply marvelous.

So far, also, as affording requisite oppor-

ART EDUCATION—ART OF POETRY

tunities for acquiring thorough training in the fine arts of painting, sculpture, and architecture, the few art schools in the United States compare most favorably with those of the older countries; so that it is no longer essential—though it may often be for other reasons desirable—for the ambitious young painter, sculptor, or architect, to exile himself in order to obtain needed opportunities for instruction in those several arts. Nor are our leading technical schools of science inferior in equipment or in quality of instruction to the similar schools in Europe. These schools in the United States are, however, so few in number in proportion to our increasing population as compared to the number and variety of those offered to the citizens of the leading art industrial European countries of Germany, Switzerland, Belgium, and France—not to mention Great Britain, Austria, Italy, and Russia—that the inadequacy in numbers of our schools for training the captains of industry, not to mention those merely technical trade schools designed for creating a force of trained workers, impresses itself painfully upon the investigator in these fields. With the increasing knowledge of the forces of nature acquired by the patient investigations continually carried on by scientists of every class, in chemistry, in geology, in natural philosophy, in mining, both in the methods of mechanical operations and in the reduction of ores; in short, in the general application of the discoveries of science throughout the various realms of nature to the needs of man which so constantly revolutionize former methods and create ever new demands; for example, in the endeavor to secure the economic production of electricity and to contrive the best methods for its application to human uses, not to speak of the similar needs in other fields, the demand on the community for the founding of institutions for giving thorough training in these latest discoveries of science is imperative.

In all these ever-recurring demands for the invention and application of methods by which to make these discoveries of science available in the industries of life, a knowledge of, and practical facility in the art of mechanical drawing becomes absolutely indispensable; consequently, this elementary branch of industrial art clearly forms an essential factor in modern industrial education, and, of necessity, holds place in all the elementary and higher schools of technology. To close this sketch of the beginning and progressive development of this important educational movement, without making honorable mention by name of some, at least, of the many enthusiastic supporters and earnest co-workers with the three men who were literally the pioneers in this momentous experiment, is to leave it incomplete indeed. To give here a complete list of the many educators and lovers of beauty who gave it warm welcome; of the modest teachers who shrank from no labor in the effort to fit themselves to teach the unfamiliar lessons were an impossible task. Great effort was made, however, by the writer in the volumes of the art and industry report to secure full record of the names of all workers for this special branch of education. It may be said, greatly to the credit of our countrymen, that while there was at first, on the part of many, great and freely outspoken opposition to the movement, yet very many of the acknowledged lead-

ers in educational circles—State or city—school superintendents, with professors in colleges and normal schools,—gave instant and hearty welcome to Walter Smith and his methods; that the press generally gave support to the efforts to put both drawing and manual training in the schools, and that, as rapidly as the purpose and methods of industrial drawing were generally known that movement won for itself popular support, while the movement for manual training in the schools was at once heartily welcomed by the great majority of the people.

One movement, almost contemporary, for promoting instruction in the fine arts, both in the institutions of learning and in the community at large, met with cordial response from many of the colleges and from numerous liberal citizens. As the result of generous gifts, public collections of casts from the antique became accessible in many institutions of learning and in many localities where, before 1870, they were absolutely unknown. To patronize artists, and also to make art gifts to public museums and to colleges, became a fashion, so that great numbers of examples of the best modern art masters of Europe are now in this country, either in the hands of private owners or in public art galleries. Meantime numbers of young American painters and sculptors are winning favor in Europe and America, while the art schools in this country are thronged with eager aspirants. Enough has been cited of American art accomplishment to convince us that one would no longer be justified in saying of this "era" of 1890, as was said of another era at the opening of this chapter, that "the one element absolutely lacking in all American education was the æsthetic." Industrial art proves its worth to a country by its results, as shown in the industrial output. To record the amazing variety and exquisite charm of the countless productions of art work in metals, ceramics, and fabrics by Americans of this "era" would demand volumes.

ISAAC EDWARDS CLARKE,

Bureau of Education, Washington, D. C.

Art, History of. See FINE ARTS.

Art, Metropolitan Museum of, a spacious edifice in Central Park, New York, erected by the city for the purpose to which it is devoted. It was incorporated in 1870, and possesses an art collection amounting in value to over \$2,000,000, including the Cesnola collections. The treasures to be found here are various in character and of most profound interest, especially the ancient sculptures and relics from the island of Cyprus. These, in the study of antiquities, are of much value, and many of the other departments possess rare attractions.

Art of Poetry, The ('Ars Poetica'), a famous work by Horace. This is not the name given it by its author, who called it merely a

ART UNIONS — ARTEDI

'Letter to the Pisos.' Horace treats of the unity that is essential to every composition, and the harmonious combination of the several parts, without which there can be no lasting success. In the second part, the poet confines himself to the form of the drama, the principles he has already established being so general that they apply to every class of composition.

Art Unions, a name applied to associations for the encouragement of the fine arts by the purchase of works of art out of a common fund raised by small subscriptions or shares, and their distribution by lot. The first art union was started in France; but the Munich art union was the first of importance. Berlin and other towns of Germany soon followed the example of Munich, and the first art union was founded in Edinburgh in 1834, and proved a complete success. The art union of London soon followed that of Edinburgh.

Arta, ar'ta, the name of a gulf, town, and river. The gulf (ancient *Ambracius Sinus*), an arm of the Ionian Sea, between Greece and Albania, is about 20 miles long by 10 miles broad. Near its entrance the battle of Actium was fought. The town, called also Narda (the ancient *Ambracia*), about six miles north of the gulf, stands on the river, which is here about 200 yards wide, and begins to be navigable. It carries on a considerable trade in wine, oranges, and tobacco. Pop (1896) 7,582.

Ar'taba'nus IV., the last of the Parthian monarchs, who 217 A.D., escaping with great difficulty from a perfidious massacre begun by the Romans under Caracalla, mustered an army, and engaged his foes in a battle which lasted for two days. Peace was then concluded, but Artabanus afterward incited his subjects to revolt, and in a battle, in 226, was taken and put to death.

Ar'taba'zus, the name of several distinguished Persians under the dynasty of the Achaemenidae. When Xerxes advanced against Greece, an Artabazus led the Parthians and Chorasmians. Another Artabazus was general under the Persian king, Artaxerxes II., and afterward revolted against Artaxerxes III. He was forgiven through the exertions of his brother-in-law, Mentor, a favorite and staunch supporter of the next king, Darius, whom Artabazus faithfully attended after the battle of Arbela. Alexander rewarded his fidelity by appointing him satrap of Bactria.

Artagnan d', dar'ta-nyân', the hero of Dumas' 'Trois Mousquetaires,' 'Vingt ans après,' and 'Le Vicomte de Bragelonne.' He is a Gascon adventurer, very popular among heroes of romance. There was, however, a Count d'Artagnan (b. about 1612; d. 1673), who was an officer of musketeers, and fell in the siege of Maestricht.

Artasires, (ar'ta-väs'dēz) the last Arsacid monarch of Armenia. He was placed on the throne by Bahram V. of Persia, who afterward deposed him and annexed his dominions to Persia, under the name of Persarmenia, 248 B.C.

Artavasdes (ar'ta-väs'dēz) I., a king of Armenia, who succeeded his father Tigranes. He joined the Roman forces commanded by Crassus, but deserting to the enemy, caused the defeat of the Romans, and the death of Crassus. He simi-

larly betrayed Mark Antony when engaged against the Medes; but afterward falling into Antony's power, was taken with his wife and children to Alexandria, where they were dragged at the victor's chariot wheels in golden chains. After the battle of Actium, Cleopatra caused his head to be struck off and sent to the King of Media.

Artax'ata, the name of the ancient capital of Armenia, the refuge of Hannibal when forsaken by Antiochus. Its ruins are now known as Ardashir.

Artaxerxes, är'täks-erks'ēz, the name of several Persian kings: (1) ARTAXERXES I., surnamed LONGIMANUS, because his right hand was longer than his left, the second son of Xerxes, escaped from Artabanus and the other conspirators who had murdered his father and elder brother Darius, and in 465 B.C. ascended the throne. He conquered the rebellious Egyptians, terminated the war with Athens by granting freedom to the Greek cities of Asia, governed his subjects in peace, and died 425 B.C. (2) ARTAXERXES II., surnamed MNEMON, from his strong memory, succeeded his father, Darius II., in the year 405 B.C. After vanquishing his brother Cyrus he made war on the Spartans, and forced them to abandon the Greek cities and islands of Asia to the Persians. He favored the Athenians, and endeavored to foment dissensions among the Greeks. His last days were embittered by the unnatural conduct of his son Ochus, who, to secure the crown to himself, caused the destruction of two of his brothers. On the death of Artaxerxes Mnemon, 359 B.C., Ochus ascended the throne under the name of (3) ARTAXERXES OCHUS. After having subdued the Phœnicians and Egyptians, and displayed great cruelty in both Egypt and Phœnicia, he was poisoned in 339 by his general, Bagoas. (4) ARTAXERXES BEBEGAN was the first king of Persia of the race of Sassanides. He was a shepherd's son; but his grandfather, by the mother's side, being governor of a province, he was sent to the court of King Ardavan. On his grandfather's death, Artaxerxes, exciting the people to revolt, defeated and slew Ardavan and his son, and assumed the title of King of Kings. He made vast conquests, and wisely administered the affairs of his kingdom.

Artedi, ar-tä'de, Peter, an eminent Swedish naturalist: b. Anund, 22 Feb. 1705, d. Amsterdam, Holland, 27 Sept. 1735. He went in 1724 to Upsala, and turning his attention to natural history, soon rose to considerable eminence, particularly in the department of ichthyology, the classification of which he reformed upon philosophical principles. This arrangement added greatly to his reputation as a naturalist at the time, and afterward became popular over Europe. In 1728 his celebrated countryman, Linnæus, arrived in Upsala, and a lasting friendship was formed between the two men. In 1732 both left Upsala — Artedi for England, in pursuit of his favorite study; and Linnæus for Lapland, to examine its natural productions; but before parting they reciprocally bequeathed to each other their manuscripts and books upon the event of death. According to agreement his manuscripts came into the hands of Linnæus, and his 'Bibliotheca Ichthyologica' and 'Philosophia Ichthyologica,' together with a life of

ARTEMIA — ARTERIES

the author, were published at Leyden in the year 1738. Linnaeus named a genus of umbelliferous plants *Artedia*, in memory of his friend.

Artemia. See BRINE-SHRIMP.

Artemido'rus, a Greek geographer: b. in Ephesus, who flourished about 100 B.C. His 'Geographonmena' in clever books was an exhaustive work on the various features, geographical, physical, historical, and political, of the larger part of the then known world, founded on the writer's own investigations and the works of preceding writers. Only fragments of his work are extant.

Artemis, a Greek goddess, identified with the Roman Diana. She was the daughter of Zeus (Jupiter) and Leto or Latona, and was the twin sister of Apollo, born in the island of Delos. She is variously represented as a huntress, with bow and arrows; as a goddess of the nymphs, in a chariot drawn by four stags; and as the moon goddess, with the crescent above her forehead. She was a maiden divinity, demanding the strictest chastity from her worshippers, and is represented as having changed Actaon into a stag, and caused him to be torn in pieces by his own dogs, because he had secretly watched her as she was bathing. The Artemisia was a festival celebrated in her honor at Delphi. The famous temple of Artemis at Ephesus was considered one of the wonders of the world, but the goddess worshipped there was very different from the huntress goddess of Greece, being of Eastern origin, and regarded as the symbol of fruitful nature.

Artemisia I., *ar'te-mizh'i-a*, or *mish-i-ä*, a queen of Caria, who lived in the 5th century B.C., and assisted Xerxes in person against the Greeks, and behaved with such valor that the Athenians offered a reward for her capture, and the Spartans erected a statue to her.

Artemisia II., a queen of Caria, who flourished about 350 B.C. She was the sister and wife of Mausolus, whose death she lamented deeply, and to whom she erected, in her capital, Halicarnassus, a monument reckoned among the seven wonders of the world. The principal architects of Greece labored on it. Bryaxis, Scopas, Leochares, and Timotheus made the decorations on the four sides of the edifice; Pythes, the chariot drawn by four horses, which adorned the conical top. Vitruvius thought that Praxiteles was also employed on it. After the death of Artemisia the artists finished it without compensation, that they might not be deprived of the honor of their labor. It was an oblong square, 411 feet in compass, and 130 feet high. The principal side was adorned with 36 columns, and 24 steps led to the entrance.

Artemisia, a genus of aromatic, acrid, and bitter flavored herbs and shrubs of the natural order *Composita*, mostly natives of the northern hemisphere and especially abundant in arid regions. The species are characterized by alternate often deeply-lobed or divided leaves, and numerous small and generally inconspicuous heads of yellow or whitish florets. The cultivated species, of which there are many, are readily propagated by division and succeed even on poor dry soils. *A. dracunculus*, tarragon or estragon, is a Siberian perennial, long and widely cultivated in Europe, but little in America, for

its leaves, which are used to season dressings, pickles, and other culinary preparations. (See TARRAGON.) *A. absinthium*, wormwood, a native of Europe and Asia, is a spreading and branching perennial herb, 2 to 4 feet tall, with its two- or three-parted silky-downy leaves, and its flower-heads in axillary panicles. It is widely grown in Europe for the manufacture of absinthe (q.v.). *A. abrotanum*, southernwood, old man, is a shrubby species, 3 to 4 feet tall, a native of middle Asia and southern Europe, and is often grown for its pleasant-smelling foliage, which is used among clothing as a moth repellent, and in parts of Europe in the manufacture of some kinds of beer. *A. pontica*, Roman wormwood, another European species, resembles *A. absinthium* in properties and is similarly used. *A. vulgaris*, mugwort, is a native of Europe and northern North America, grown for its pleasant-smelling ornamental foliage, which in some varieties is golden or variegated. Its young shoots and leaves are used in German cookery, and like *A. absinthium*, in domestic medicine. *A. stelleriana*, old woman, a native of northeastern Asia and common on the Massachusetts coast, is a useful border plant on account of the whiteness of its foliage. *A. arbuscula*, a species seldom more than one foot tall, and *A. tridentata*, which though usually low growing, occasionally reaches a height of twelve feet, are representative of the many species known as sage brush (q.v.) in the arid districts of the western United States, where they furnish valuable forage for cattle and especially sheep. *A. mantma* and several other species are grown for their flower heads, which are used in medicine as a vermifuge and sold under the name of worm seed or as santonine, the colorless crystalline active principle. *A. moxa*, *A. chinensis*, and other species furnish moxa, a cottony material obtained from the leaves which are covered with down, used by the Chinese for cauterizing. Numerous other species are employed in the manufacture of absinthe, for culinary, ornamental, and medicinal purposes in various parts of the world. For physical action and toxicology, see ABSINTHE.

Artemisium, *ar-te-mish-i-um*, a promontory in Euboea, an island of the Ægean, near which several naval battles between the Greeks and Persians were fought, 480 B.C. It was named from a temple to Artemis situated here.

Artemus Ward. See BROWNE, CHARLES FARRAR.

Arte'rial Pressure. See BLOOD PRESSURE.

Ar'teries, the vessels in the human body that carry arterial, or oxygenated blood away from the heart. The old name, signifying carriers of air, is retained, although the ancient belief has been laid aside. The arteries spring from the heart, as the aorta (q.v.) and by the branching and division of the main branches of this large arterial trunk, are distributed in successively finer branches to all parts of the human body. The blood supply for the head is mainly derived from the carotid arteries, the superficial, or external carotid, supplying the outer structures, and the deep or internal carotid that gives nourishment to the brain and deeper lying parts. There are numerous anastomoses between the branches of the carotid arteries. The main sup-

ARTERIES — ARTESIAN

ply of the arm has been described under the head aorta (q.v.), as well as the branches that supply the viscera and the lower limbs. Arteries become smaller and smaller as they approach the periphery of any organ and are finally converted into capillaries which anastomose with the capillaries of the veins; these carry the blood back to the heart and thus the circle is completed. The minute structure of the arteries is well adapted to the varying functions that these vessels perform. In every large and medium-sized artery, three distinct layers or coats may be distinguished under the microscope. The inner coat, or the *tunica intima*, is thin and smooth, and consists of an inner layer of flat plate-like endothelial cells that are continuous throughout the entire system of blood vessels. This endothelial layer by its smoothness reduces friction of the flowing blood to a minimum. Surrounding it are two layers of fibrous elastic tissues. The middle coat of the arteries is the *tunica media* and is composed mostly of smooth muscle fibres, with some fibrous tissue. These muscle fibres are arranged in a circular manner about the arteries. The outer coat, or the *tunica adventitia*, is made up of white fibrous tissue. Thus the arteries have elastic and fibrous tissues in each coat. The outer layer is extremely tough and thus strengthens and protects; the middle layer by means of its elasticity permits the artery to return to its average diameter after it has been dilated or contracted by the muscular layer. In the larger arteries the yellow fibrous tissue predominates, while in the smaller arteries there is a relatively larger amount of muscle fibre. The large arteries are thus more elastic and less contractile, while for the smaller arteries the reverse is true. The muscle fibres are under the control of the sympathetic nervous system nerve fibres. In the capillaries the artery is reduced to its single endothelial layer, and has neither elastic fibres nor muscle fibres.

Arteries, Diseases of. The arteries are subject to a number of diseases which may be classed as (1) due to infectious micro-organisms, (2) degenerations with increase of connective tissue, (3) aneurisms. Of the acute infectious diseases, tuberculosis and syphilis, particularly the latter, are important. Syphilis is one of the most important causes of arterial degeneration. *Acute arteritis* is a definite disease, although the great pathologist, Virchow, taught that it was a secondary affection. Recent bacteriological studies, however, have shown that bacterial infection of the arterial walls is a fundamental and important process. It is frequently the cause of an arterial thrombus and often develops into a true arteriosclerosis. Under the general head arteriosclerosis is classed a diffuse or circumscribed thickening of the arterial walls, especially of the *tunica intima*, secondary to inflammatory or degenerative changes in the *tunica media*. When occurring in the large arteries, the term *atheroma* is used. Arteriosclerosis is sometimes found in the young, but is usually a disease of later life. Among the causes favoring its development are: (1) changes in the composition of the blood, such as toxins from bacterial infections (syphilis, rheumatism), metallic poisons, alcohol, and the disturbed metabolism of gout, Bright's disease, etc., and (2) changes in the tension of the blood vessels. These occur as a result of excessive

and prolonged muscular exertion and intense emotional activity. Arteriosclerosis may be circumscribed or diffuse. It may show irregular plaques of a transparent or gelatinous character which at a later period become hard and firm, or even calcified with the formation of brittle or pipe stem arteries. Sometimes the arteries undergo a fatty degeneration. There is a proliferation of the connective tissue and a degeneration of the elastic tissue. The arteries thus become less responsive to control and so interfere with the nervous impulses. In the diffuse form the proliferation and degeneration is more uniform. Arteriosclerosis is one of the most important of all diseases since by its interference with the proper blood supply of an organ, it may occasion disease in that organ. In pronounced generalized arteriosclerosis all of the organs of the body suffer. Arteriosclerosis is one of the most important elements in the production of cerebral hemorrhage, one of the forms of apoplexy. Aneurisms have already been considered under that heading.

Arteriosclerosis. See ARTERIES, DISEASES OF
Artesian (är-tě-zhăn) Wells, borings of considerable depth which tap a subterranean stream or sheet of water. The name is derived from artois (Latin *artesium*), a province in France where the first deep borings in Europe were made. Strictly speaking the term artesian is applicable only to such wells as discharge water at the surface under natural conditions (that is, self-flowing wells), but in America the term is commonly applied to any wells of more than ordinary depth. As the latter type of wells does not possess any features of special interest the term will here be used in its limited sense. The conditions which determine the presence of artesian water in a region relate to the geological structure of the underlying strata. It is essential in the first place that a pervious stratum enclosed above and below by impervious layers be present. The pervious bed, usually sandstone or sand, serves as a reservoir for the accumulation of water, while the impervious beds prevent this water from escaping either upward or downward. The second requisite is that the strata have a gentle pitch toward the site of the well and that they outcrop at some place above the mouth. The distance of the outcropping edges, which receive the water supply from rains, is sometimes very great, and is immaterial if the enclosing beds are perfectly impervious, except as it modifies the resistance offered to the passage of the water. Owing to this friction the water column of the well never reaches the level of the outcropping source. The conditions for artesian water are particularly favorable when the strata are arranged in the form of a geological basin dipping in all directions toward the well, as there then is no opportunity for the water to escape at a lower level. From these considerations it is evident that the discharge from an artesian well depends upon the rainfall of the region and upon the area of the exposed porous stratum. At first the discharge is usually very abundant owing to the long accumulation, and unless this drain is constantly supplied the flow will gradually decrease until a balance is established. When several wells are bored in the same vicinity, the flow from each may be diminished, but the total discharge will increase until the limit of supply is reached. This is

ARTEVELD — ARTHRITIS

well illustrated in the wells bored in the London basin which in 1838 gave a total daily supply of 6,000,000 gallons; in 1851 with a larger number of borings the supply was about doubled, while the force had diminished very markedly. Artesian water is valuable not only for domestic use, for which it is usually adapted by its purity, but it is also extensively employed in the irrigation of arid regions. Some parts of the Sahara Desert have been reclaimed by making use of the subterranean stores of water, and recent investigations have shown that there are many areas which may yet be brought under cultivation. It is, however, in the United States that irrigation by artesian waters has reached its greatest development. Special surveys of the Great Plains region have been undertaken by the United States Geological Survey for the purpose of defining the areas where successful borings may be made, and artesian wells are now largely employed for irrigation in Kansas, Iowa, Colorado, Montana, and Texas. The supply is drawn mostly from the Cretaceous sandstone, which is reached at a depth varying from less than 100 to more than 1,500 feet. When the flow of water is sufficiently strong it may be utilized for power purposes as is done in some parts of Europe. In Wurtemberg a supply of warm water is applied to the heating of buildings.

The depth at which artesian water may be found depends entirely upon local conditions. In the Paris basin the water-bearing stratum is usually encountered at a depth exceeding 1,500 feet. The famous well at Grenelle, near Paris, was begun in 1833, and operations were continued until 1841 when at a depth of 1,797 feet the water poured out with great force at the rate of 500,000 gallons per day. Another well was sunk near by at Passy, which yielded 5,600,000 gallons daily, the water rising to a height of 54 feet above the mouth. This well was 1,923 feet deep and had the unusual diameter of 2 feet 4 inches. A well at Kissingen, Bavaria, furnishes a supply of saline water from a depth of 1,878 feet. The deepest well in the world is at Schladenbach, near Leipsic, 5,735 feet. In the United States there are many notable examples of artesian wells. The first boring of great depth was made at St. Louis in 1849-54; a flow of 75 gallons per minute was obtained from a depth of 2,200 feet, but the water was so heavily charged with sulphuretted hydrogen and mineral matter as to be unfit for domestic use. Another boring was subsequently made to a depth of 3,843 feet. A well at Louisville, Ky., is 2,086 feet deep and yields 330,000 gallons per day. Among other noteworthy wells are the following: Columbus, O. (2,775 feet); Galveston, Tex. (3,071 feet); Charleston, S. C. (1,250 feet); Pittsburg, Pa. (4,625 feet); and Chicago (710 feet). A great many wells have been bored in recent years within the Atlantic Coastal Plain, especially in New Jersey, and many cities have thus obtained supplies of pure water. The cost of sinking artesian wells varies with the depth and the character of the strata encountered. Up to 500 feet the cost commonly ranges from \$1.50 to \$3.00 per foot, but below this limit the cost increases in proportion to the depth. The apparatus used in boring does not differ from that employed in sinking for petroleum. The first artesian borings were probably made by the

Chinese. In the upper basin of the Yang-tse-Kiang there are wells 1,500 to 3,000 feet in depth from which brine for salt manufacture is obtained. This industry has been carried on since a very early period and is an illustration of the comparatively advanced state of progress attained by this people long before the western nations had developed the mechanical arts beyond the crude stage. Deep wells have been found also in Egypt which are thought to have been the work of the ancient Egyptians. A well bored in the year 1126 at Lillers, department of Pas-de-Calais, France, is still flowing.

Arteveld, ar'tě-vě'l'dě, or **Artevelde**, the name of two men distinguished in the history of the Netherlands. (1) **JACOB VAN**, a brewer of Ghent, b. about 1290; d. 17 July 1345. He was selected by his fellow townsmen to lead them in their struggles against Count Louis of Flanders. In 1338 he was appointed captain of the forces of Ghent, and for several years exercised a sort of sovereign power. A proposal to make the Black Prince, son of Edward III of England, governor of Flanders, led to an insurrection, in which Arteveld lost his life. (2) **PHILIP VAN**, son of Jacob, b. 1340; d. 27 Nov. 1382. At the head of the forces of Ghent he gained a great victory over the Count of Flanders, Louis II., and for a time assumed the state of a sovereign prince. His reign proved short-lived. The Count of Flanders returned with a large French force, fully disciplined and skilfully commanded. Arteveld was rash enough to meet them in the open field at Roosebeke, between Courtrai and Ghent, in 1382, and fell with 25,000 Flemings. See Ashley, 'James and Philip van Artavelde' (1883); Hutton, 'James van Artavelde' (1882).

Artevelde, **Philip van**, the title of a tragedy by Sir Henry Taylor, published in 1834. It is one of the best of modern English tragedies by an author distinguished for his protest, in the spirit of Wordsworth, against the extreme sentimentalism of Byron. In this play with admirable power he brings back the stress and storm of 14th century life. The father of Philip, the great Jacob van Artevelde, an immensely rich brewer, eloquent and energetic, had played a great part as popular leader at Ghent, 1335-45; and it fell to his son to figure similarly in 1381, but to be slain in a great defeat of the forces of Ghent the next year. Taylor's tragedy recalls the events of these two years.

Art'ful Dodg'er, **The**, the nickname of John Dawkins, a young pickpocket in Dickens' 'Oliver Twist.'

Arthralgia (Neo.-Lat. from Gr. *ἀρθρον*, joint, + *ἀλγος*, pain), pain in a joint; used more specifically of neuralgia in a joint. It is synonymous with arthrodynia.

Arthri'tis, an acute or chronic inflammation of the joints, usually due to bacterial infection. Such infection may follow a wound, a perforating injury, an operative incision, or the micro-organisms may come to the joint through the blood stream, as in rheumatism, gonorrhœa, typhoid, or pyæmia. In some cases of arthritis the causes seem to be resident in defective metabolism—gout is an illustration of this type of arthritis. In acute cases there are pain, swelling, heat, and occasionally suppuration. In the chronic forms the main symptoms are pain and

ARTHRITIS DEFORMANS

stiffness. The treatment should include rest, counter-irritation, and, in the suppurative cases, prompt surgical attention. In the more chronic cases counter-irritation, dry, hot air, static electricity, and potassium iodide are of service. See ANTHRITIS DEFORMANS; GOUT; JOINT; RHEUMATISM.

Arthritis Deformans (rheumatoid arthritis, or osteo-arthritis), a chronic progressive disease of the joints, chiefly affecting the articular cartilages, bones, and synovial membranes, and producing loss of function and great deformity from ossification of some parts of the joint and atrophy of others. Its origin is not definitely known. Though it is sometimes spoken of as rheumatic gout, it is believed to have nothing in common with rheumatism or gout, but may co-exist with either.

It is very rare in children, occurs occasionally in old age, is more common between 25 and 50, and in females than in males. It most often appears after the menopause, though it may occur earlier, as when following parturition. It is doubtful whether the disease is hereditary, although several cases may occur in one family. Exposure to inclement weather, dietetic errors, injuries, etc., have less causative influence than in gout or rheumatism, but poor food, debility, anæmia, and cold and damp increase the severity of the disease. Mental strain precedes many cases and adds very much to the severity of the disease.

There are two theories as to the immediate cause of the affection. The first, the nervous or neuropathic theory, is based upon the symmetrical distribution of the joint-lesions, the trophic changes in the skin, nails, etc., the frequent pre-existing mental disturbances, shock, grief, worry, and the like, the disproportionate muscular atrophy, and the similarity of the lesions to those of locomotor ataxia and other affections of the spinal cord. The second or infectious theory is derived from the facts that micro-organisms have been found in the fluids and tissues of the joints, that the disease sometimes begins with an acute onset, as do many of the infectious diseases, and that enlargement of the spleen and lymph-glands is found in some cases. It is difficult to say which tissue is primarily at fault, but sooner or later nearly all are involved. The synovial membrane inflames, and papillary outgrowths and cartilaginous nodules form upon it. These last may undergo fatty degeneration, or they may ossify. They may slip into the joint-cavity. If serous effusion occurs it is absorbed early in the disease. The cartilages lose their cells, become fibrillated and soft, and are removed by friction and absorption. The ends of the bones (the interarticular cartilages being absorbed) by friction become smooth, rounded, and shiny, like polished ivory (eburnated). The eburnated surfaces, by attrition, become grooved, and minute perforations of the Haversian canals result. Deposits of new bone form around the margins of the joints, and may be often felt externally. The muscles atrophy and are of a brownish color. Fibrous adhesions and bony ankylosis occur. Some of the small joints of the fingers, for example, may move a little, but the knees, etc., may be interlocked, by reason of the rims of bony material deposited. Dislocation or subluxation may result. The periosteum along the shafts of the bones may thicken or ossify in nodules.

The acute form of the general or multiple progressive type is rare after 40. Smaller joints become simultaneously painful, tender, and swollen, but not red as in rheumatism; there is no migration from joint to joint, the affected joints are inflamed, while others are becoming diseased. Patients are anæmic, mentally depressed, and complain of headache and malaise. Fever seldom goes above 102°. Temporary improvement occurs, but the disease advances. The chronic form of this type is insidious and more common. One joint (of finger or toe) is involved; the disease affects the corresponding joint, and then other joints; pain may be mild or very severe; there are delusive intervals while the disease marches on. After months, or it may be years, all or nearly all of the joints are thickened, rigid, and distorted. The hands are bent toward the ulnar side, fingers strongly flexed, nails in the palms of the hands. The thumbs, though drawn in, may be used. The knees are generally crossed. The general health through it all may be fair, as visceral lesions are uncommon.

In the monarticular or localized type, the disease is usually confined to one or two of the larger joints, occurs mostly in men, and after 50. The knee, shoulder, elbow, or hip is generally affected, but the vertebræ may be, the entire spinal column becoming rigid. Motion of affected joints often produces a creaking or grating sound. The pathological appearances are similar to those of the general type of the disease, but joint-injuries are more often an exciting cause. The joint becomes stiff, sore, and painful, and there is absorption of the ends of the bones, dislocation, and deformity.

Heberden's nodes or nodosities, described by him in 1805, are small exostoses ("small hard knobs"), seldom larger than peas, which form on either side of the distal joints of fingers. They may be present in either type of the disease, at first are tender and swollen, but later on apparently cause little discomfort. Sometimes the bone-enlargement surrounds the joint.

Arthritis deformans in children, although not frequent, is more acute, and is more influenced by poor food, cold and damp, etc. There is fever, sometimes a chill. The swelling, stiffness, and tenderness seem to be more in the soft parts than in harder tissues. The fingers are flexed and overlapped, the feet are strongly extended, and the joints are rigid.

The diagnosis of arthritis deformans must be made from subacute and chronic rheumatism, gonorrhœal rheumatism, gout, progressive muscular atrophy, Charcot's disease, etc. Recovery is impossible, but the disease is not directly dangerous to life. Treatment for relief is hygienic and dietetic, a warm, dry, equable climate, dry, healthful quarters, change of scene, freedom from anxiety, shock, etc., woolen underclothes, flannel nightgowns or pajamas, and ample diet. Malt extracts, iron, and cod-liver oil are of service. Locally there should be application of massage, friction, electricity, douching, hot air in so-called hot-box, guaiacol and glycerine in equal parts, or belladonna ointment, cotton, and oil-silk. Residence at one of the spas, with appropriate care and treatment, will relieve suffering and prolong life. See ARTHRITIS; GOUT; JOINT; RHEUMATISM.

ARTHROACE—ARTHROPODA

Arthroace (Neo-Lat. from Gk. *ἄρθρον*, joint + *κακός*, evil), a disease of the joints in which the bone is disintegrated and carried away piecemeal. See **CARIES**.

Arthro'dia. See **JOINT**.

Arthrodynia (Neo-Lat. from Gk. *ἄρθρον*, joint + *δύνη*, pain), pain in a joint; practically synonymous with **arthralgia**.

Arthrogastra (Neo-Lat. from Gk. *ἄρθρον*, joint + *γαστήρ*, abdomen), a division of the insect class *Arachnida* (q.v.), having the abdomen annulated, and including the scorpions (see **SCORPION**), etc.

Arthromere (Gk. *ἄρθρον*, joint + *μέρος*, part), one of the series of segments of which arthropoda (q.v.) are composed.

Arthropathia Tabidorum, a disease of the joints in connection with spinal disease (*tubercles dorsalis*), very similar to *arthritis deformans* (q.v.). The destruction of the ends of the bones in the joint concerned takes place with great rapidity and painlessly; there is no fever nor appearance of inflammation, even when the bones are fractured.

Arthrophragm (Gk. *ἄρθρον*, joint + *φράγμα*, fence), a partition between certain articulations, as, for example, in the crayfish (q.v.).

Arthropleure (Neo-Lat. *Arthropleura*, from Gk. *ἄρθρον*, joint + *πλευρά*, side), the lateral portions of the arthroderm, or crust, of articulated animals. See **ARTICULATA**.

Arthrop'oda, a phylum comprising those articulated animals which have jointed appendages, such as antennæ, jaws, maxillæ (or accessory jaws), palpi, and legs, arranged in pairs, the two halves of the body thus being more markedly symmetrical than in the lower animals. It is by far the most numerous in species of any in the animal kingdom, the insects alone probably numbering upward of a million species; other representative or typical forms are the trilobites, king crabs, scorpions, spiders, and myriopods. The skin is usually hardened by the deposition of salts (carbonate and phosphate of lime), and of a peculiar organic substance called chitine. The segments (somites or arthromeres) composing the body are usually limited in number, 20 (or 21) in the crustaceans and insects; while each arthromere is primarily divided into an upper (tergum), lower (sternum), and lateral portion (pleurum). These divisions, however, cannot be traced in the head of either the crustaceans or the insects. Moreover, the head is well marked, with one or two pairs of feelers or antennæ, and from two to four pairs of biting mouth-parts or jaws, and two compound eyes; besides the compound eyes there are simple eyes in the insects. The germ is three-layered, and there is usually in the more specialized forms a well-marked metamorphosis. The *Arthropoda* are most nearly related to the worms, certain annelides, with their soft-jointed appendages (tentacles as well as lateral cirri) and more or less definite head, anticipating or foreshadowing the arthropods. On the other hand, certain low parasitic arthropods, as *linguacula*, have been mistaken for genuine parasitic worms.

Segmentation of the Body.—The segments (somites, metamereres) are merely thickenings of

the skin connected by a thin intersegmental membrane, so that the segments can telescope into each other, or extend, thus lending the greatest freedom of motion to the trunk as well as to the appendages; otherwise a rigid chitinous skin would not permit of any movement. As in the annelid worms, this segmentation of the integument is correlated with the serial repetition of the ganglia of the nervous system, of the ostia of the dorsal vessel, the primitive disposition of the segmental and reproductive organs, of the soft, muscular dissepiments which correspond to the suture between the segments, and with the metameric arrangement of the muscles controlling the movements of the segments on each other; and this internal segmentation or metamerism is indicated very early in embryonic life by the mesoblastic somites.

While we look upon the dermal tube of worms as a single but flexible lever, the body of the arthropods, as Graber states, is a linear system of stiff levers. We have here a series of stiff, solid rings, or hoops, united by the intersegmental membrane into a whole. When the muscles extending from one ring to the next behind contract, and so on through the entire series, the rings approximate each other.

The origin of the joints or segments in the limbs of arthropods was probably due to the mechanical strains to which what were at first soft fleshy outgrowths along the sides of the body became subjected. Indeed, certain annelid worms of the family *Syllida* have segmented tentacles and parapodia, as in *Dujardinia*. We do not know enough about the habits of these worms to understand how this metamerism may have arisen, but it is possibly due to the act of pushing or repeated efforts to support the body while creeping over the bottom among broken shells, over coarse gravel, or among sea-weeds. It is obvious, however, that the jointed structure of the limbs of arthropods, if we are to attempt any explanation at all, was primarily due mainly to lateral strains and impacts resulting from the primitive endeavors of the ancestral arthropods to raise and to support the body while thus raised, and then to push or drag it forward by means of the soft, partially jointed, lateral limbs which were armed with bristles, hooks, or finally claws. By adaptation, or as the result of parasitism and consequent lack of active motion, the original number of segments may by disuse be diminished. Thus in adult wasps and bees, the last three or four abdominal segments may be nearly lost, though the larval number is ten. During metamorphosis the body is made over, and the number, shape, and structure of the segments are greatly modified.

History and Present Classification.—The group or sub-kingdom (phylum) of *Arthropoda* was founded in 1848 by Siebold. It has been supposed until recently to be a natural group. In 1893 Kingsley, and also Kennel, first suggested doubts as to the homogeneity of the group, and in the same year Packard published the view that there are four independent lines of development in the *Arthropoda*, and in 1894 Kingsley divided the group into three subphyla, Laurie and Pocock also considering that the group is polyphyletic. In 1898 Packard stated: "It is becoming evident, however, that there was no common ancestor of the *Arthropoda* as a whole, and that the group is a polyphyletic one.

ARTHROSTRACA — ARTHUR

Hence, though a convenient group, it is a somewhat artificial one, and may eventually be dismembered into at least three or four phyla or branches."

The four phyla as afterward proposed by Packard are, beginning with the most primitive: (1) *Palaeostraca*, embracing the classes of *Trilobita*; (2) *Merostomata* (*Limulus*), and *Arachnida*; (3) *Pancarida* (*Crustacea*); (4) *Prosogoneata*, including three classes: *Paupropoda*, *Diplopoda*, and *Lymphyla* (*Scolopendrella*); and (5) *Entomoptera*, comprising the *Chilopoda* and *Insecta*; the great majority of the group being winged insects. Each of these phyla represent independent lines of development, judging by their structure and what we know of their development, and have no genetic connection beyond the theory that they each have descended from one or more annelid worm.

A. S. PACKARD,
Brown University.

Arthrostraca, crustacea of the sub-class *Malacostraca* in which the first, sometimes the second thoracic segment is fused with the head and bears maxillipedes; the remaining seven being free and bearing legs. The eyes are usually sessile. The group is divided into the *Amphipoda* (q.v.) and *Isopoda* (q.v.) Common examples are pill-bugs, wood-lice, etc

Ar'thur, king of the Silures in the 6th century, an ancient British hero, whose story has been the theme of much romantic fiction. He is said to have been the son of Uthyr, chief commander of the Britons, and to have been born about 501. In 516 he succeeded his father in the office of general, and performed those heroic deeds against the Saxons, Scots, and Picts which have made him so celebrated. He married the celebrated Guinevere belonging to the family of the dukes of Cornwall; established the famous order of the Round Table; and reigned, surrounded by a splendid court, 12 years in peace. After this, he is reported to have conquered Denmark, Norway, and France, slain the giants of Spain, and journeyed to Rome. From thence he is said to have hastened home on account of the faithlessness of his wife, and Modred, his nephew, who carried on an adulterous intercourse, and stirred up his subjects to rebellion; to have subdued the rebels, but to have died in consequence of his wounds, in 542, on the island of Avalon, where it is pretended that his grave was found in the reign of Henry II. The story of Arthur is supposed to have some foundation in fact, and it is generally believed that he was one of the last great Celtic chiefs who led his countrymen from the west to resist the settlement of the Saxons in southern Britain. But many authorities regard him as a leader of the Cymry of Cumbria and Strath-Clyde against the Anglo-Saxon invaders of the east coast and the Picts and Scots north of the Forth and the Clyde. In our own day the interest of the old legends has been revived by the works of Lytton and especially Tennyson. See Skene, 'Four Ancient Books of Wales' (1868); Stuart-Glennie, 'Journey through Arthurian Scotland' (1867); and 'Arthurian Localities' (1869); Rhys, 'Studies in the Arthurian Legend' (1891); Sommer, 'Morte d'Arthur' (3 vols. 1889-91); Brown, 'Twain: A Study in the Origin of Arthurian Romance' (1902). See ARTHURIAN LEGENDS.

Ar'thur, Prince. See DUKE OF CONNAUGHT.

Ar'thur, duke of Brittany, the grandson of King Henry II. of England: b. 1187; d. 1203. On the death in 1199 of his uncle, Richard I., who had declared the boy his heir, Arthur was proclaimed king of England by the nobles of Anjou, Touraine, and Maine, while the English lords decided in John's favor. King Philip of France supported the claims of Arthur, but a peace being presently concluded between John and Philip, Arthur came later into the hands of his uncle, King John, and soon mysteriously disappeared. According to general belief Arthur was murdered by command of his uncle. The story of Arthur forms a portion of Shakespeare's 'King John.' See JOHN.

Arthur, Chester Alan, the 21st President of the United States. b. Fairfield, Vt., 5 Oct. 1830; d. New York, 18 Nov. 1886. He graduated from Union College at 18, was principal of an academy at North Pownal, Vt., and in 1853 began the practice of law in New York, where he argued several important legal cases in behalf of the colored people. Through these and other cases he became noted in his profession, and he was also prominent as a Republican politician. In April 1861 Gov. E. D. Morgan made him acting quartermaster-general, and later he was made full quartermaster-general. For the next decade he was a successful and widely known practising lawyer, and a leading Republican politician of New York, chairman of the Grant Club in 1868, and of the executive committee of the Republican State committee in 1869. He was appointed by President Grant, 20 Nov. 1871 to the highest office in the State patronage, the collectorship of the port of New York, which he held till 11 July 1878. His business conduct of the office was not impeached, and he was retained by President Hayes for over a year after his accession; but he was first of all a political manager, in open hostility to civil service reform. As a matter of actual practice and not theory, however, Mr. Arthur produced figures to show that the annual percentage of removals under him for all causes had been only 234 per cent, as against an annual average of 24 per cent since 1857. In 1880 he was nominated for the vice-presidency, chiefly to conciliate the Grant section of the Republicans, sore at the defeat of the third-term project, and was elected with Garfield. In place of the customary dignified nullity of his office, he remained an active party leader in the patronage contest of his State, between the "Stalwarts" or Grant section led by Roscoe Conkling (q.v.), and of which Mr. Arthur was chief lieutenant, and the "Half-Breeds" or more independent wing which Garfield was trying to build up. Conkling soon resigned his seat in the Senate, declaring that Garfield had broken his promises to him, and the Garfield party for the time was triumphant; but the assassination of Garfield, shortly after, reversed the situation. The open lamentations of the press at the prospect of the accession of so convinced a spoilsman as himself deeply hurt Mr. Arthur, who felt that he was misjudged, and determined on the most admirable revenge, that of disappointing their prophecies of evil. He did so; not only was his term of office measurably free from the dominance of patronage, but he extended the civil service rules and kept faith with them. In other respects his ad-

ARTHUR—ARTHURIAN LEGENDS

ministration was so excellent that the leading Independents had announced their intention of supporting him for President if nominated in 1884. Its most notable incident was the appointment of a commission to revise the tariff, which, though composed of strong Protectionists, reported that the tariff should be reduced 20 per cent all around, a recommendation unheeded by Congress. Several commercial treaties were passed, however. He vetoed a Chinese immigration bill as inconsistent with treaty obligations; favored the stringent laws passed against polygamy, appointing a Utah commission to supervise their enforcement; managed Indian affairs wisely, promoting Indian education and the breaking up of the tribal system; extended postal facilities; took measures to increase the navy, improve its discipline and efficiency and provide for coast defense; supported the improvement of Mississippi River navigation, etc. The attempts at remonetizing silver, and at forcibly abrogating the Clayton-Bulwer treaty to build a Nicaragua canal, were in accordance with general party feeling at the time. The lingering scandal of the Star Route frauds, however, injured the party somewhat, and its policy and methods were gravely disapproved of by the Independents; but this was much more than counterbalanced by distrust of the Democratic party for its alliance with the Greenback element. Mr. Arthur's defeat for the nomination was not caused by any demerits of his own, still less by desire to conciliate the Independents, but by the personal ambitions of Mr. Blaine (q.v.), who first caused the crushing defeat of Arthur's secretary of war, S. J. Folger, for governor of New York, and in 1884 was nominated for President. Arthur, although a close adherent of Conkling, who was at enmity with Blaine, supported the campaign of the latter.

Ar'thur, Joseph Charles, an American botanist: b. Lowville, N. Y., 11 Jan 1850. He was graduated from Iowa State College in 1872, and subsequently studied at the universities of Johns Hopkins, Harvard, and Bonn, Germany. He was instructor in the universities of Minnesota and Wisconsin; botanist at the Experiment Station, Geneva, N. Y., and is now professor of vegetable physiology and pathology, Purdue University, Lafayette, Ind.

Arthur, Julia, the stage name of Ida Lewis, an American actress: b. Hamilton, Ont., 3 May 1869. She made her professional debut at the age of 14 as the Prince of Wales in 'Richard III.' Her first New York success was in 'The Black Masque.' She made her London debut February 1895 in Henry Irving's company, playing roles next to Helen Terry, both of whom she accompanied to America in 1896. Since then she has starred chiefly in the United States. She is the wife of B. P. Cheney. See Strang, 'Famous Actresses of the Day in America' (1899).

Arthur, P. M., American locomotive engineer: b. Scotland 1834; d. Winnipeg, Manitoba, 16 July 1903. He came to America in childhood and as a young man was at first a blacksmith's helper in the employ of the New York and Harlem Railroad Company and later an engineer on the New York Central railroad. In 1873 he became the grand chief of the American Brotherhood of Locomotive Engineers, which post he filled at the time of his death.

Ar'thur, Timothy Shay, an American author: b. Newburg, N. Y., 1809; d. Philadelphia, 6 March 1885. In 1852 he founded 'Arthur's Home Magazine.' He was a voluminous writer of moral and domestic tales. His works are over 100 in number, and have had a large sale in England as well as in the United States. His most popular work was the famous 'Ten Nights in a Bar-Room.' Among his other publications were 'Tales for Rich and Poor,' 'Tales of Married Life,' and 'Lights and Shadows.'

Arthu'rian Leg'ends, a series of Celtic romances, which for nearly a thousand years have furnished unlimited literary material, not to English poets alone, but to the poets of all Christendom. These Celtic romances, having their birthplace in Brittany or in Wales, had been growing and changing for some centuries, before the fanciful 'Historia Britonum' of Geoffrey of Monmouth, flushed them with color and filled them with new life. Through his version they soon became a vehicle for the dissemination of Christian doctrine. By the year 1200 they were the common property of Europe, influencing profoundly the literature of the Middle Ages, and becoming the source of a great stream of poetry that has flowed without interruption down to our own day. Sixty years after the 'Historia Britonum' appeared, and when the English poet Layamon wrote his 'Brut' (A.D. 1205), a translation of Wace, as Wace was a translation of Geoffrey, the theme was engrossing the imagination of Europe. It had absorbed into itself the elements of other cycles of legend, which had grown up independently; some of these, in fact, having been at one time of much greater prominence. Finally, so vast and complicated did the body of Arthurian legend become, that summaries of the essential features were attempted. Such a summary was made in French about 1270, by the Italian Rustighello of Pisa; in German, about two centuries later, by Ulrich Futerer; and in English by Sir Thomas Malory in his 'Morte d'Arthur,' finished 'the ix. yere of the reygne of kyng Edward the Fourth,' and one of the first books published in England by Caxton, 'emprynted and fynysshed in th' abbey Westmestre the last day of July, the yere of our Lord MCCCCLXXXV.' It is of interest to note, as an indication of the popularity of the Arthurian legends, that Caxton printed the 'Morte d'Arthur' eight years before he printed any portion of the English Bible, and 53 years before the complete English Bible was in print. It has been said that the original legend absorbed into itself the elements of other cycles of legend. The most important of these was 'The Holy Grail' (q.v.). At once a new spirit breathes in the old legend. In a few years it is become a mystical, symbolical, anagogical tale, inculcating one of the profoundest dogmas of the Holy Catholic Church, a bearer of a Christian doctrine engrossing the thought of the Christian world. In addition to the mystical and religious character of the transformed legend, the spirit of the chivalry of the Middle Ages embodied in it, furnishes an admirable transcript of the social ideal of the times, which thus moulded the older and ruder materials into a more gracious form. The knightly ideals of loyalty, obedience, the redressing of wrongs and especially the veneration of womanhood are distinctively portrayed.

CHESTER ALAN ARTHUR.

21ST PRESIDENT OF THE UNITED STATES.

Throughout the Middle Ages it was "our lady," the Virgin Mother, who embodied and represented to all men and women, from prince to peasant, their ideals of womanhood and ladyhood. And it was the transference of these Christian ethics into the practice of common daily, worldly life, in rude times, which we owe to the institution of chivalry, nowhere better reflected than in the Christianized Arthurian legends. From about 1200, innumerable poets, with diverse tastes, set themselves to produce new versions of the legend, engrafting upon the general theme many diverse stocks. Dante in the 'Divine Comedy' speaks of Arthur, Guinevere, Tristan, and Launcelot by name, and Boiardo, Ariosto, and Tasso in Italy, Hans Sachs in Germany, Spenser, Shakespeare, Milton, and Dryden in England, all made use of the same material.

Of the poets of the present generation, Tennyson has treated the Arthurian poetic heritage as a whole. Phases of the Arthurian theme have been presented also by his contemporaries and successors at home and abroad—by William Wadsworth, Lord Lytton, Robert Stephen Hawker, Matthew Arnold, William Morris, Algernon Charles Swinburne, in England; Edgar Quinet in France, Wilhelm Hertz, L. Schneegans, F. Roeber, in Germany; Richard Hovey in America. There have been many other approved variations on Arthurian themes, such as James Russell Lowell's 'Vision of Sir Launfal,' and Richard Wagner's operas, 'Lohengrin,' 'Tristan and Isolde,' and 'Parsifal.' Of still later versions, we may mention the 'King Arthur' of J. Comyns Carr, which has been presented on the stage by Sir Henry Irving; and 'Under King Constantine,' by Katrina Trask, whose hero is the king whom tradition names as the successor of the heroic Arthur 'Imperator Dux Bellorum.'

Arthur's Seat, a hill overlooking Edinburgh, Scotland, said to have been so called from a tradition that King Arthur surveyed the country from its summit and defeated the Saxons in its neighborhood. It is a steep, and in some places precipitous, rock, exhibiting on the south side a range of perpendicular basaltic columns, called Samson's Ribs. The highest point is 822 feet above sea-level. From hence may be seen a wide expanse of sea, the course of the Forth, the distant Grampians, etc., and a large portion of the most populous and best cultivated part of Scotland, including the picturesque city of Edinburgh and its castle. On the north side are the ruins of a chapel and hermitage, dedicated to St. Anthony, and a fine spring called St. Anton's Well. A carriage road called the Queen's Drive goes round its base.

Artichoke, two species of the natural order *Compositæ*. The true, sometimes called French, artichoke (*Cynara Cardunculus*—scaly mus of some authors), a native of the Mediterranean region, is a coarse, stout, perennial, thistle-like herb, 3 to 5 feet tall, with rather spiny leaves, the lower of which are often 3 feet or more long, and large terminal heads of blue or white flowers. It is cultivated for the edible thickened outer scales and "bottoms" (receptacles) of the flower heads which sometimes exceed 4 inches in diameter without becoming too old for eating raw as salad, pickled, or cooked like cauliflower. Sometimes the young stems and leaves are blanched like cardoon, with

which some botanists consider it to be identical. In Europe many varieties are popular; in America the globe variety is planted almost to the exclusion of others, with the result that this variety has almost become united to the name in popular usage. The cultivation of this species in America is confined mostly to the southern States, few gardens in the North being supplied with it. Since the plant is rather tender, winter protection must be given where the ground freezes. If planted in rich soil and set four feet apart the plants will yield two or three crops before a new plantation should be made; if allowed to stand longer the yield gradually diminishes. New plantations are made either with seedling or sucker plants. Most of the artichokes offered in the northern markets of the United States come from France and Louisiana.

The Jerusalem artichoke (*Helianthus tuberosus*), a native of North America, is a perennial sunflower-like herb, 5 to 12 feet tall, with rough leaves 4 to 8 inches long and many yellow terminal flower-heads often 2 to 3 inches in diameter. The edible pear-shaped purplish, red, white, or yellow tubers for which the plant is often cultivated are numerous, seldom more than 3 inches in diameter, rather watery but of pleasant flavor especially when prepared like cauliflower, with a white sauce. Perhaps no vegetable is of easier cultivation. For home use the tubers are generally planted in well-drained soil in some out of the way corner of the garden and allowed to take care of themselves from year to year, the few tubers and pieces of root left after digging sufficing to re-stock the bed. In field culture the methods are like those practised with the potato except that the tubers may be left in the ground over winter and dug when needed. They are not injured by frost if in the soil, but if frozen after being dug they spoil quickly. If desired they may be dug and stored in pits like turnips, but with a somewhat lighter covering of straw and earth. The usual yield is from 200 to 500 bushels to the acre but 1,000 bushels are sometimes obtained. When land becomes infested, as it sometimes does, with the plant, pigs, for which the tubers make valuable food, may be turned loose upon the field. The tubers resemble potatoes in composition and like them are used largely in Europe for the manufacture of alcohol. The young plants are sometimes used as cattle food and the dry stalks for fuel. Consult 'Bur or Globe Artichoke' in United States Department of Agriculture Year Book, 1899; Circular 31 (1899); Bailey, 'Cyclopædia of American Horticulture' (1900-02); Vilmorin, 'The Vegetable Garden,' translation by Robinson (1885).

Article, in grammar, a part of speech used before nouns to limit or define their application. In the English language *a* or *an* is the indefinite article (the latter form being used before a vowel sound) and *the* the definite article. The English indefinite article is really a modified form of the numeral adjective *one*; so the German *ein* and the French *un* stand for the numeral and the article. There are traces in various languages showing that the definite article was originally a pronoun; thus the English *he* is closely akin to both *this* and *that*. The Latin language has neither the definite nor the indefinite article; the Greek has the definite; the

ARTICLES

Hebrew and Arabic definite article was prefixed to its noun, while, on the other hand, in the Syriac and Chaldaic it was affixed to the noun, as it is in the Icelandic. In the Scandinavian language the definite article is appended to the end of the word as *hus-et*, the house.

Articles, divisions of a printed or written document or agreement. A specification of distinct matters agreed upon or established by authority or requiring judicial action. In chancery practice articles are a formal written statement of objections to the credibility of witnesses in a cause in chancery, filed by a party to the proceedings, after the depositions have been taken and published. The object of articles is to enable the party filing them to introduce evidence to discredit the witnesses to whom the objections apply, where it is too late to do so in any other manner (2 Daniel Chan. Pr. 1158), and to notify the party whose witnesses are objected to of the nature of the objections, that he may be prepared to meet them. Upon filing the articles a special order is obtained to take evidence. The interrogatories must be so shaped as not to call for evidence which applies directly to facts in issue in the case. 3 Johns. Ch. N. Y. 558. The objections can be taken only to the credit and not to the competency of the witnesses. 3 Johns. Ch. N. Y. 558; 3 Atk. Ch. 643, and the court are to hear all the evidence read and judge of its value. 2 Ves. Ch. 219.

Articles of Agreement.—A written memorandum of the terms of an agreement. They may relate either to real or personal estate, or both, and if in proper form will create an equitable estate or trust such that a specific performance may be had in equity. The articles of agreement should contain a clear and explicit statement of the names of the parties, with their additions for purposes of distinction, as well as a designation as parties of the first, second, etc., part; the subject-matter of the contract, including the time, place, and more important details of the manner of performance; the covenants to be performed by each party; the date, which should be truly stated. It should be signed by the parties or their agents. When signed by an agent the proper form is, A. B., by his agent (or attorney), C. D.

Articles of Confederation.—The title of the compact which was made by the 13 original States of the United States of America. It was adopted and carried into force 1 March 1781 and remained as the supreme law until the first Wednesday of March 1789.

Articles of Faith.—Summarized statements of religious views relating to the central doctrines of a theological system. Protestant divines divide these into fundamental and non-fundamental articles. Familiar examples of articles of faith are the Nicene, Apostles', and Athanasian creeds, the Thirty-Nine Articles, the Westminster, Augsburg, and Helvetic Confessions. See CREED.

Articles of Impeachment.—A written articulation of the causes for impeachment. Blackstone calls them a kind of bill of indictment, and they perform the same office which an indictment does in a common criminal case. They do not usually pursue the strict form and accuracy of an indictment, but are sometimes quite general in the form of their allegations. They should, however, contain so much cer-

tainty as to enable a party to put himself on the proper defense, and in case of an acquittal to avail himself of it as a bar to another impeachment. Additional articles may perhaps be exhibited at any stage of the proceedings. The answer to articles of impeachment is exempted from observing great strictness of form, and it may contain arguments as well as facts. A full and particular answer to each article of the accusation should be given.

Articles of Partnership.—A written agreement by which the parties enter into a partnership upon the conditions therein mentioned. The instrument should contain the names of the contracting parties severally set out; the agreement that the parties do by the instrument enter into a partnership, expressed in such terms as to distinguish from a covenant to enter into a partnership at a subsequent time; the date and necessary stipulations, some of the more common of which follow. The commencement of the partnership should be expressly provided for. The date of the articles is the time, when no other time is fixed by them. The duration of the partnership should be expressly stated. It may be for life, for a limited period of time, or for a limited number of adventures. When a term is fixed it is presumed to endure until that period has elapsed, and when no term is fixed, for the life of the parties, unless sooner dissolved by the acts of one of them, by mutual consent, or operation of law. The duration will not be presumed to be beyond the life of all the partners, but provision may be made in the articles for the succession of the executors or administrators or a child or children of a deceased partner to his place and rights. Where provision is made for a succession by appointment and the partner dies without appointing, his executor or administrators may continue the partnership or not at their option. A continuance of the partnership beyond the period fixed for its termination, in the absence of circumstances showing intent, will be implied to be upon the basis of the old articles (15 Ves. Ch. 218), but for an indefinite time. The nature of the business and the place of carrying it on should be carefully stated. An injunction will be granted by a court of equity when one or more of the partners endeavors, against the wishes of one or more of them, to extend such business beyond the provision contained in the articles. The name of the firm should be ascertained. The members of the partnership are required to use the name thus agreed upon, and a departure from it will make them individually liable to third persons or to their partners in individual cases. The management of the business, or of some particular branch of it, is frequently entrusted by stipulation to one partner, and such partner will be protected in his rights by equity, or it may be to a majority of the partners, and should be where they are numerous. The manner of furnishing capital and stock should be provided for. When a partner agrees to furnish his proportion of the stock at stated periods, or pay by installments, he will, where there are no stipulations to the contrary, be considered a debtor to the firm. Sometimes a provision is inserted that real estate and fixtures belonging to the firm shall be considered as between the partners, not as partnership, but as individual property. In cases of bankruptcy, this property will be treated

ARTICLES — ARTICULATA

as the separate property of the partners. The apportionment of profits and losses should be provided for. The law distributes these equally, in the absence of controlling circumstances, without regard to the capital furnished by each. Periodical accounts of the property of the partnership may be stipulated for. These, when settled, are at least *prima facie* evidence of the facts they contain. The expulsion of a partner for gross misconduct, bankruptcy, or other specified causes may be provided for, and the provision will govern when the case occurs. A settlement of the affairs of the partnership should always be provided for. It is generally accomplished in one of the three following ways: *First*, by turning all of the assets into cash, and after paying all the liabilities of the partnership, dividing such money in proportion to the several interests of the parties; or, *second*, by providing that one or more of the partners shall be entitled to purchase the shares of the others at a valuation; or, *third*, that all the property of the partnership shall be appraised, and that after paying the partnership debts it shall be divided in the proper proportions. The first of these modes is adopted by courts of equity in the absence of express stipulations. Submission of disputes to arbitration is frequently provided for, but such a clause is nugatory, as no action will lie for a breach.

Articles of War — A code of laws for the regulation of the military forces of a country. In the United States the articles of war form an elaborate code, thoroughly revised in 1880, but subject at all times to the legislation of Congress. Those of Great Britain and Ireland were issued prior to 1879, in pursuance of the annually renewed mutiny act. In 1879 the army discipline act consolidated the provisions of the mutiny act with the articles of war. This act was amended in 1881, and now the complete military code is contained in the army act of 1881.

Articles, The Six. In English Church history these were articles of faith imposed by the Act 31 Henry VIII. cap. xiv., passed by Parliament in 1539, and known as the Six-stringed Whip or Bloody Statute, from the merciless persecutions to which it gave rise. They are supposed to have been the composition of King Henry himself, and they had no formal authority from the Church. They enforced belief in transubstantiation; declared communion in both kinds unnecessary; the marriage of priests was unlawful; that vows of chastity or widowhood were absolutely binding; and that private masses and auricular confession were expedient and necessary. The severity of the act was soon mitigated, and it was finally repealed in the first year of Edward VI.

Articles, The Thirty-nine, of the Church of England, a term applied to a body of divinity, chiefly founded on the formulary of Forty-two Articles compiled by Archbishop Cranmer in 1551, in obedience to the command of Edward VI. and the privy council, who instructed him to "frame a book of articles of religion, for the preserving and maintaining peace and unity of doctrine in this Church, that, being finished, they might be set forth by public authority." Several of these articles (the 1st, 2d, 25th, and 31st) were drawn directly from the Augsburg Confession, and the 9th and 16th are traceable to the same

source. During the reign of Mary the Articles were suppressed, but the accession of Elizabeth offered an opportunity of drawing up a fresh formulary. In 1562-3 a convocation was held, in the course of whose sitting King Edward's Articles were carefully considered and revised. As the result of this revision (mainly the work of Archbishop Parker, assisted by Bishops Grindal, Horn, and Fox), four of the original 42 articles were omitted, namely, the 10th, 16th, 19th, and 41st, and articles 5th, 12th, 29th, and 30th were newly introduced; 17 other articles were more or less modified. On a further revision articles 39th, 40th, and 42d were struck out, and some slight changes made in several others. These 39 articles were drawn up and ratified in Latin, but when printed both in Latin and English the 29th was omitted and the first clause of the 20th struck out. The 39th was, however, restored on a final revision by Parker in 1571, and then imposed on the clergy for subscription. They were ratified anew in 1604 and 1628. All candidates for ordination must subscribe these articles, but subscription is no longer necessary on matriculating or taking a degree at Oxford or Cambridge. This formulary is now accepted by the Episcopalian Churches of Scotland, Ireland, and America.

The first five articles contain a profession of faith in the Trinity, the incarnation of Jesus Christ, his descent to hell, and his resurrection, and the divinity of the Holy Ghost. The three following relate to the canon of the Scripture. The 8th article declares a belief in the Apostles', Nicene, and Athanasian creeds. The 9th and following articles contain the doctrine of original sin, of justification by faith alone, of predestination, etc. The 19th, 20th, and 21st declare the Church to be the assembly of the faithful, and that it can decide nothing except by the Scriptures. The 22d rejects the doctrine of purgatory, indulgences, the adoration of images, and the invocation of saints. The 23d decides that only those lawfully called shall preach or administer the sacraments. The 24th requires the liturgy to be in English. The 25th and 26th declare the sacraments effectual signs of grace (though administered by evil men), by which God excites and confirms our faith. They are two: baptism and the Lord's Supper. Baptism, according to the 27th article, is a sign of regeneration, the seal of our adoption, by which faith is confirmed and grace increased. In the Lord's Supper, according to article 28th, the bread is the communion of the body of Christ, the wine the communion of his blood, but only through faith (article 29); and the communion must be administered in both kinds (article 30). The 28th article condemns the doctrine of transubstantiation, and the elevation and adoration of the Host; the 31st rejects the sacrifice of the mass as blasphemous; the 32d permits the marriage of the clergy; the 33d maintains the efficacy of excommunication. The remaining articles relate to the supremacy of the king, the condemnation of Anabaptists, etc.

Artic'ula'ta, a name given by Cuvier to a branch of the animal kingdom embracing the worms (*Annulata*) and *Arthropoda*. The group is not now considered a natural one, and has been subdivided into several branches or phyla.

ARTICULATION — ARTIGAS

Art'iculation. See **JOINT**.

Artificial Camphor, a product manufactured from turpentine. The sap of the pine tree after it is distilled and purified is the turpentine of commerce. A couple of thousand pounds of this material is placed in great steam reaction tanks; these are covered with asbestos to retain the heat. A quantity of oxalic acid, which is rich in oxygen, is likewise placed in the reaction tanks, together with the turpentine, and when the chemical action resulting from the union has been completed two new chemicals are formed and are known as pinol oxalate and pinol formate, respectively. These are in liquid form and are conveyed to a set of distilling tanks by means of a force pump; in these tanks a new element is introduced in the form of an alkali, and when mixed with the liquid live steam is turned on. After distillation camphor results, together with some of the essential oils, such as oil of lemon and others, but these are dissolved in the reaction products, which also contain a kind of camphor termed borneol.

Artificial Flowers, flowers manufactured from cloth or other substances in close imitation of natural flowers, for purposes of ornament. The leaves and petals are generally made of silk or cambric punched out to proper shapes and sizes. These are tinted with a brush and color, and if necessary glazed with gum or sprinkled with fine flock to imitate the glossy or velvety surface of natural flowers. The ribs, where present, are indented with a warm iron. The stamens and pistils are formed of wire covered with silk and dipped in gum-water to form the anthers. The stalk is then made of wire, coated with green paper, and fixed to the stamens and pistil, around which are attached the petals, and lastly the calyx. Buds are made of cotton or glass balls covered with cambric of a proper color. This industry has been successfully carried on in the United States, where a large number of women are constantly employed in making artificial flowers. The coloring matter, however, used for these articles is often nothing less than the deadly poison arsenic. Hoffman and other chemists have shown that the most terrible effects may spring from the use of these arsenical compounds.

Artificial Limbs, substitutes for human arms and legs and parts thereof, the manufacture of which has received the attention of surgeons and mechanics from a very early date. In the great work on surgery by Ambrose Paré, in 1579, he refers to and gives detailed illustrations of an artificial arm and leg, and although the construction was of a rude character they showed a very good attempt to conceal the mutilation. In 1696 an artificial leg was invented by Verduin, a Dutch surgeon. It was composed of a wooden foot, to which was fastened two strips of steel extending up to the knee. To these strips was riveted a copper socket to receive the stump; a leather for lacing around the thigh was connected to the socket by two steel side-joints, thus dividing the points of support between the thigh and stump. The construction of this leg was improved later by Prof Serre of Montpelier. Improvements and new limbs were more recently introduced into England and France by Fred. Martin, M. Charrière, MM. Mathieu and Bechard, but these were mostly unprotected by patents. Thomas Mann secured

patents for artificial limbs 20 Jan. 1790, and 1810. James Potts of England patented a new leg 15 Nov. 1800. This soon became celebrated as the "Anglesea leg," because it was so long worn by the Marquis of Anglesea. An improvement on this leg was patented by William Selpho, who was the first manufacturer of note in New York, where he established himself in 1839. Other inventors and manufacturers soon took a great interest in the business — so many, in fact, that the American patent office shows a record of about 150 patents on artificial legs, or more than double that of all European patents on limbs. The Civil War, which caused the mutilation of so many soldiers and sailors, and the liberality of the government in supplying their losses with artificial limbs, naturally stimulated the efforts of inventors in producing such substitutes as would be accepted. These soldiers and sailors are supplied once in every five years, and to this demand is added that of those who have lost limbs from disease or accident, making in all about 100,000 in the United States who have to be supplied with new limbs on an average of about once in every five to eight years. The perfection to which limbs have been brought is wonderful and very interesting. A person with two artificial legs can walk so perfectly as to avoid detection, and a person with a single amputation can almost defy detection. Notable improvements in artificial limbs, and more particularly in legs, were made by C. A. Frees of New York. One of these improvements, and one of the most important, consists in the movements of the knee and ankle joints, by which the whole limb is strengthened and made more durable. An important feature of this piece of mechanism consists in the introduction of a universal motion at the ankle-joint, imitating the astragalus movement with an additional joint, and thus producing a most perfect artificial substitute. Another of his improvements of equal importance, is in the knee-joint of the leg for thigh amputation, which is so arranged that when in a sitting position the cord and spring are entirely relaxed, relieving all strain and pressure; and when rising to an upright position the cord and spring are again brought into proper position without strain or unnatural movement, no extra attachments being required. Artificial arms and extension apparatus for short legs are also wonderful examples of American ingenuity.

Artificial Respiration. See **ASPHYXIA**; **DROWNING (Treatment)**; **RESPIRATION**.

Artificial Stone, a combination of hydraulic cement, broken stone, sand, etc., cemented together. There are many varieties, some of which are exceedingly valuable for building purposes, especially in localities where building-stone is not readily obtained. Cements thus made increase in strength and solidity for an indefinite period. This stone is in constantly increasing demand. For the various kinds and uses see **CEMENT**.

Artigas, ár-tē'gas, **Fernando José**, a South American soldier, dictator of Uruguay: b. Montevideo, 1755; d. in 1851. In 1811 he joined the revolt of Buenos Ayres against Spain, whose troops he repeatedly defeated; but acting for himself was outlawed by the insurrectionary junta, whose troops in turn he routed and compelled it to cede Uruguay to him in 1814. He then assumed the dictatorship, but in 1820 was

ARTILLERY

defeated and fled to Paraguay, where the dictator Francia banished him to Candelaria. Thereafter he devoted himself to agriculture and philanthropy.

Artillery (a restricted use of a word properly meaning simply "works of skill," "clever inventions"): (1) All firearms too heavy to be carried in the hand and therefore rested on carriages or masonry foundations; (2) the division of army or navy which uses such arms; (3) the science treating of their theory and practice. The first is divided into *horse* artillery,—light guns mainly for cavalry use, with mounted gunners, and much the same as *flying* artillery, for rapid evolutions in the field, whose gunners are either mounted or ride on the gun-carriages of ammunition wagons when moving; *field* artillery, for general infantry service,—sometimes used to include the foregoing, but commonly specialized to mean the same as *foot* artillery, with unmounted gunners; (*light* artillery includes both these classes, as distinguished from the following); and *heavy* artillery,—all that is not mobile enough for field evolutions,—divided into *siege* or *garrison* artillery, for breaching the walls of fortresses or defending field works, and *coast* artillery, for permanent works, with carriages too heavy for transport, classed as *siege*, *casemate*, *barbette*, and *mortar* carriages.

A *park* of artillery is a complete set of artillery equipment,—including the guns, carriages, caissons (see **AMMUNITION**, under "ammunition wagons"), repair outfit, harness, field forges, etc.,—gathered in one spot, in barracks or in action; in the latter case the reserve equipment is "parked" out of range of the enemy's fire. A *train* of artillery is a certain number of pieces mounted on carriages and with all their furniture, ready for marching. "Artillery carriages" means either wagons for carrying ammunition or supplies, as above; or gun-carriages, to draw the guns with or fire them from, which may be either stationary as for coast service and permanent works, or movable as in field service. The part which rests on the ground in firing is called the *trail*; the detachable pair of wheels by which it is drawn about, in addition to the fixed pair, is called the *limber*, and the gun is said to be "unlimbered" when they are taken away to let the gun be served, and "limbered up" when they are attached.

The old word "cannon" is not now used by professionals, but "gun" instead. The volume of a gun's service is defined either by the diameter of its bore, as 6-inch, 12-inch, etc.; or by the weight of the spherical iron solid shot it holds, as 12-pounder, 18-pounder, etc. (often abbreviated to 12's, 18's, etc.). The latter characterization has long been used to denote calibre only, without reference to the actual weight of the projectile it fires: thus, a 12-pounder may fire a 30-pound conical shell. This is necessarily so since the entire disuse of spherical shot (see **AMMUNITION**).

The relation of artillery to small-arms was essentially the same before the invention of gunpowder as afterward: hand-arms, as arrows, darts, slings, swords, etc., corresponded to small-arms and the bayonet; while the artillery consisted of machinery too heavy to be held up, for throwing large projectiles, the power being springs, levers, or weights. Midway between

them, however,—as the matchlock arquebuse, rested on the ground to fire, was between small-arms and artillery, but a far more efficient weapon,—was the crossbow or arbalist: a heavy bow with steel or horn frame, stretched by a winch or in its larger sizes by a windlass, and shooting a notched quarrel (that is, a quadrate or square-headed bolt), or sometimes stones or balls of lead. It could be carried by a hunter, or fixed on field or deck; could penetrate armor, and was so destructive as to be prohibited by the Church except in war against the Infidel; and in the early Middle Ages was as decisive in naval or siege warfare, when well handled, as modern artillery, winning many important sea fights and others; but in the field it was too slow for the highest efficiency, as it could be fired only twice a minute. Its larger sizes were true artillery in the modern sense; and like it, but heavier, were the ballista, springal, and onager, which threw stones from a bucket or bag, also beams and masses of inflammable material, at or over walls of besieged places. The catapult, mangonel, and *trébuchet* (the latter a machine of surprising accuracy and power, as proved by an experimental model made by Prince Louis Napoleon in 1850, and used to breach walls) threw the same missiles by means of a spring lever balanced by a heavy weight, and held down by a windlass.

The introduction of modern gunpowder artillery is clouded by unverifiable legends and confused with the use of explosive mixtures to make a terrifying noise, and with the throwing of inflammable materials by the machines above mentioned. If the Chinese invented it, as alleged, they did it so ineffectively that the great progressive military genius Timur (1333-1405) did not think it worth using; and if the Spanish Saracens used it in Spanish sieges in the 12th century, they did not employ it against Northern foes, nor did the latter borrow it; whereas within a few years of the first verifiable European notice we have it,—a Florentine order of 1326 relating to the manufacture of cannon and iron balls,—it had gone over Europe like wild-fire. The Germans used it at Cividale, Italy, in 1331; Edward III. by at least 1338; the latter formed a regular artillery train of iron and brass cannon in 1344 (in which year also Petrarch speaks of it as familiar and common), and employed it at Crécy in 1346, though ineffectively. Naturally cannon came before small-arms: even so, the first were excessively clumsy in size and construction,—bell-shaped tubes with a touchhole for a train of priming powder set off by a fuse or red-hot iron above; made of iron bars hooped together, or of hand-hammered and bored iron, copper, or brass cylinders; and supported on immense platforms drawn by scores or even hundreds (as with Mohammed II.'s cannon at the siege of Constantinople in 1453) of draft animals, or of men. Sometimes they were not even closed tubes, but open at breech as well as muzzle, the shot being wedged in; sometimes they had no carriages, but were rolled into position and wedged or blocked there. They were mortars rather than cannon in the modern sense, being short and wide-mouthed, and sending off their balls or stones at a great elevation, and were known as bombards or vases. They were of use mainly in siege work; and it was not till toward 1500 that field artillery in its modern sense came into much use, Charles VIII.

ARTILLERY

of France utilizing it in his Italian campaigns from 1488 onward.

There was no permanent artillery organization: the gunners were detailed from garrisons, and disbanded and sent back there as soon as the campaign was over; and in England the command in the field was by the Master of the Ordnance, an artillery commissary-general in effect. The transport cattle were hired or impressed, and the drivers of gun-carriages were ordinary teamsters hired by contract or secured for the occasion. Curiously, these last did not form a part of the military body till Napoleon's time.

The 16th century developed this arm greatly in volume, but not so much in science: projectile mathematics were rudimentary, and the imperfect mobility of the guns crippled their usefulness in battle—once they had fired a few rounds in advance of the troops to clear a path and cow the enemy, their service was nearly at an end, as they could not fire when their own troops were in front of them nor move in front or flank to avoid them (the battle of Pavia was lost by this); and were regularly captured and retaken as either side gained ground. Francis I., however (1515-47), lightened their make and took care to secure the best draft horses, and won Marignano (1515) with them; Louis XII. (1498-1515) owed much of his success in the Italian wars to this arm; and Charles V. (1519-55) shared in its development, his Netherland subjects being so forward in it that Henry VIII. employed Dutch gunners to instruct his men. The use of cast bronze, giving surer bore and calculability, as well as lightness for a given power, became common; the bell-shaped mortars gave place to 18-pound culverins for siege work, and to 2's, 4's, 6½'s, and 8's (called falcons, falconets, and sakers) in the field. The great difficulty of carriages also,—to find one easily drawn yet stable enough to fire from,—was partially surmounted; and in Holland the miscellaneous calibres and classes of cannon were reduced to four—6's, 12's, 24's, and 48's. The Dutch and Huguenot religious wars in the latter part of the century developed the rudiments of a genuine system of artillery tactics, the use of the arm in connection with other arms as part of a tactical whole.

The first half of the 17th century is the first great landmark in the history of artillery. Henry IV. of France in his later years (d. 1610) occupied himself greatly with it; his minister Sully was master-general of artillery, and turned out over 400 pieces; and Maurice of Nassau (1584-1625), son of William the Silent, was much concerned with it. But its re-creator was Gustavus Adolphus (1611-32), who made it almost the centre of his system of warfare. Seeing that weight of ball was of minor consequence with the human body as a target, or length of range at close quarters, he devoted his whole attention to securing mobility and rapidity of fire. The former he obtained by putting nothing above a 12-pounder into the field, and by having a very light gun constructed, the fact that it would bear but a small charge being immaterial; it was made of a "thin cylinder of beaten copper, screwed into a brass breech, strengthened with four iron bands," the whole covered with mastic, cords, plaster, and finally boiled and varnished leather. It was called the *kalter* or the "leather gun," and could be drawn

about by the two gunners who served it. But the light charge it could bear made its range too short for the best results, and later it was replaced by a four-pound iron cannon, drawn by two horses. He had also heavier guns to beat down defenses, which in retreat he protected by the lighter ones. Rapid fire he secured by inventing the cartridge instead of pouring in powder, and his cannon could be fired faster than the ordinary musket. The *kalter* guns were first introduced during his Polish wars; in the Thirty Years' war his success was greatly helped by his improved artillery against the Imperialists' clumsy weapons and methods. At Breitenfeld (1631), Tilly's guns were mainly 24-pounders requiring 20 horses each and 12 for the wagons, could hardly be moved in action, and were almost at once silenced by the advance of their own troops; at the Lech (1632) Gustavus converged 72 pieces on the enemy at the river bend and made a crossing practicable; at Lutzen (1632), Wallenstein's batteries were practically stationary, Gustavus had heavy ones on his wings and centre and moving with them. He attached two guns to each regiment, under the colonel's orders—the "battalion system," but whose defect of dispersion of guns he corrected by also massing strong batteries to concentrate a crushing fire where needed; and he raised the total proportion of guns to 6 per 1,000 men, fully double that of any other nation. He also first saw that field and garrison service were essentially distinct, and separated the two branches of artillery not only in material but men. In England during this century, though the leather guns were used by the Scotch in 1640 on the invasion of England, and the Parliamentary army was crushed at Roundway Down (1643) by artillery, it remained in a comparatively undeveloped state, owing to the lack of the constant wars of the Continent; the complaint was made that there were no expert gunners in England.

In the latter part of the century, the perpetual wars of Louis XIV. led to a still further development of this arm. Even in the first part of his reign it was in a very primitive condition. The artillery officers had no functions whatever in time of peace, their nominal offices being purely titular; Vauban protested against this, but it was not remedied till Vallière's reforms of 1732. In 1671, however, Louvois first established a permanent organization for it, creating a regiment of artillerymen consisting of gunners and workmen, and establishing schools of instruction. The calibres were reduced in number and made uniform—those left (4's, 6's, 8's, 12's, 18's, 24's, and 32's) remain in use still, some of them rifled; bronze and iron were both used; carriages were much improved, made of wrought iron and provided with limbers, a special one invented for coast artillery, and platform wagons introduced. The development under him, however, was more in siege than field artillery. The Dutch and English introduced howitzers (a gun with a powder chamber smaller than the bore, for horizontal shell-firing, combining something of cannon accuracy with mortar calibre), mortars, and explosive shells, both hand and gun; and used canvas cartridges and grape-shot (several iron balls in a canvas case). The Woolwich arsenal was established in 1672. In 1682 the gunners were for the first time put un-

ARTILLERY DRILL.

ARTILLERY DRILL—PREPARING TO MOVE GUNS.

ARTILLERY

der military discipline, their function being previously considered that of civil artisans, and indeed the master gunners were carried on the civil establishment till 1783; in 1794 it was still thought needful to give the ordnance officers express authority over the gunners, by commission. William III. (1689-1702) formed the first English regimental artillery establishment, in place of detailing men from other arms as needed. England, however, was relatively backward.

The first half of the 18th century saw great extension of the specializing in this arm, and the quality of its items; but not very much invention. In France, Vallière the elder, a practical artillery general of immense ability, made great improvements; he reduced the calibres to five; lengthened the pieces, on the ground that short ones had less range and less accuracy, less ricochet and greater recoil, took more munitions and transport for equal service, and could not be used in sieges; he also greatly extended the training schools, and the continued practice of the arm in time of peace. Less usefully, he fought with success against separating the field artillery from the engineers, as involving two artillery trains instead of one. In England, Marlborough used it with effect as it was; the "Royal Regiment of Artillery" was formed in 1716 (the present body in 1722), and in 1741 the Royal Military Academy was instituted at Woolwich. The manufacture and service were both greatly improved; the English artillery was noted "for its lightness, elegance, and the good quality of its materials." The guns in use at the middle of the century were 24's, 12's, 6's, and 3's, in "brigades" (batteries) of four, five, and six guns, divided into light and heavy brigades; each field gun drawn by four horses, the two leaders driven by artillerymen. In Frederick's wars, the English artillery won great distinction. Frederick himself hardly valued this arm at its full value till the melting away of his trained soldiers compelled him to rely upon it more and more. This was perhaps rather from the extremely poor state in which his father left it, than from lack of understanding; that he realized at least a part of its defects and its importance is shown by the fact that finding the gunners and engineers mostly mechanics of inferior grade, he at once drafted the worst of them into garrisons, replacing them with men of competence and position; and as they had no commissions, and were consequently scorned by the other arms of the service, he gave the officers commissions and extra pay, and ranked them with officers of the guards. But his father had given all his attention to the drill and discipline and physical magnitude of his soldiers, to the neglect of the artillery, which at his death consisted of only one battalion of field and one of garrison, of six and four companies respectively; and Frederick inherited his general policy, though with a larger mind. His artillery was vastly inferior to the Austrian, raised to a pre-eminent position by Prince Lichtenstein. There were two pieces to a battalion, directed by a corporal without independent authority, and the battalion commander had enough on his mind without attending to artillery, which were expected always to keep a certain distance in advance of the troops, thus scanting their time to fire during an advance, and were usually cap-

tured in a sudden retreat from lack of time to limber up. Still they did good service at Rossbach, Hochkirchen, and Leuthen; and Frederick raised the proportion of guns to men, and in 1759 formed the first battery of horse artillery, of 6-pounders and 7-pound howitzers—placing great reliance on howitzers, making much use of them against intrenchments, and after the war attaching 40 heavy pieces to each corps. With only 2½ or 3 guns per 1,000 at the outset, he ended with 5 or 6; he created a horse artillery almost as rapid as cavalry; and although at the beginning of the Seven Years' war he had made the error Gustavus avoided, of using too heavy pieces in the field, he grew to appreciate mobility better, and gradually replaced them by lighter ones, saving the others for siege and garrison guns. His wars made three important changes in artillery tactics: the distribution of small batteries at important points in place of concentrating large ones on centre and flank; the preparation for an advance and the protection of deploying columns by light guns; and the rapid change in position of batteries, made possible by the horse artillery. The latter was employed by the Russians also, each regiment having three howitzers with mounted gunners.

The greatest artillery result of Frederick's wars, however, was in France. This country had been very backward in that arm since Louis XIV's time, ammunition and transport being especially crude. In 1765 Gen. Gribeauval, termed the "father of the modern artillery system,"—who had held an artillery command under Lichtenstein in the Seven Years' war, and admired the efficiency of the Austrian system,—undertook to reconstruct the French one from the bottom; for many years the fierce resistance he encountered made it impossible, though he succeeded in reorganizing the personnel; but in 1776 he became inspector-general of artillery, and carried through the rest of the most far-reaching reform ever effected in this arm, much of it permanent to this day. He divided it into field, siege, garrison, and coast artillery, with a separate class of material and separate personnel for each. For all material a uniform construction was adopted, tables of construction drawn up, and all possible parts made interchangeable. For lightness and consequent mobility, he made the pieces perfectly plain, reduced the length and weight of field pieces, which he restricted to 12's and under (guns in embrasures or behind parapets, of course, could not be shortened), reduced the charge, and therefore the necessary windage (the difference between the diameter of the projectile and that of the gun-bore). Field guns were limited to 4's, 8's, and 12's, and 6-inch howitzers. In ammunition the old grape and case shot were replaced by sheet-iron canisters holding cast-iron balls. Accuracy of fire was vastly improved by elevating screws and tangent scales, the latter based on the mathematical discovery that the path of a projectile is not flat. For siege and garrison guns he adopted at first the 12's and 16's, 8-inch howitzer, and 10-inch mortar; in 1785 the 8-, 10-, and 12-inch "gomer" mortar (with conical bore). The carriages were strengthened, lightened in draft, and improved in mechanism, and ammunition chests affixed; trunnion poles and the *prolonge* rope (to unite limber with trail, for firing in slow retreat) introduced, and the horses harnessed in pairs instead of tan-

ARTILLERY

dem; and the *bricole* devised—a collar with rope and hook to which the gunners and foot-soldiers harnessed themselves. A new ammunition wagon carrying fixed ammunition was built. Siege carriages had shafts in place of the field carriages' poles; garrison carriages, wheels in front and a truck in the rear; for coast service there were traversing platforms, with bolt in front and truck in rear on a circular racer. The field artillery was divided into regimental guns and corps or reserve artillery; the latter was subdivided into divisions of eight guns of the same calibre, and a company of artillery assigned to each brigade of four battalions. Eight pieces were also attached to the centre and to each wing. Horse artillery was not introduced till 1791, and horsemen and gunners were combined, each learning the other's work.

In the wars of the French Republic, in 1793, when the divisional organization was adopted, guns were attached to the divisions as well as to battalions; in 1796 Napoleon withdrew them from the latter and abolished the old "battalion system," to the great advantage of both arms, the infantry regiments being impeded by the guns and the guns ill served by the divided command. In 1800 he took the last step in professionalizing the arm, by establishing a driver corps of soldiers in place of outside teamsters. His only change in guns was substituting the 6-pounder of the 8's and 4's, and the use of a 24-pound howitzer, but his tactical improvements were great. He employed with enormous effect the modern system of massing gunfire on selected spots, and could not have won his prodigious victories without it, and like Frederick, as his soldiers were swept away he increased his artillery force, rising from $2\frac{1}{2}$ to about 4 per 1,000. His tactics are still part of the instruction of all soldiers.

The British began their long struggle against France very ill-equipped in all military points, and in none more so than artillery; guns, ammunition, transport, were alike crude and ill arranged, the whole equipment hardly able to move faster than foot pace. The field artillery was simply garrison artillery drafted into the field. Field and siege guns were intermingled, in batteries of 12, each battalion having two; the horses were in tandem of three, the drivers carters on foot. In the years before the Peninsular war (1808-14), however, Major Spearman had transformed it. Horse artillery was introduced in 1793; a battery consisting of two 9's and three 6's (later of 9's wholly), and a $5\frac{1}{2}$ -inch howitzer. A driver corps was formed in 1794, consisting of a few subalterns, non-commissioned officers, artificers, civilian drivers and horses—divided into "troops," one added to each company of foot artillery. Battalion guns were abolished in 1802, and six-gun field batteries organized, each of five 6 to 12-pounders and a $5\frac{1}{2}$ -inch howitzer; the drivers were to be soldiers; the horses were teamed in pairs, drivers on the off ones, and eight gunners carried on the limbers and wagons. The equipment was lightened and simplified, and ammunition well packed instead of flung into rough boxes. Excellent additions were made to material by the invention of shrapnel shell by Major Shrapnel in 1803, and by the development of the antique rocket from a mere fire-signal to a powerful engine of destruction, by Sir William

Congreve in 1806—the latter first used at Copenhagen in 1807, employed with great efficiency at Leipsic in 1813, in the Peninsular war at the Adour, and in the War of 1812 at Bladensburg.

Between 1815 and the Crimean war, the most considerable changes in material were the invention of a powerful 12-pounder howitzer weighing only 220 pounds, for mountain service, used with great effectiveness in the French campaigns in Algeria, the gun-carriage and ammunition going on muleback; the introduction in 1852 by Louis Napoleon—a hereditary artillery student, and the great work on artillery under his auspices is still a standard—of a 12-pounder to fire either solid shot or shrapnel, known as the "12-pounder Napoleon," and made the sole equipment of a set of field batteries, which did great service in his war of 1859 with Austria; and the application of rifling, though not efficiently developed till later, its use at Sebastopol being a failure. Carriages and ammunition wagons were also improved so that the gunners could ride on them, much increasing mobility; the trail was strengthened; and ammunition was carried in boxes on the limber. French field batteries, from 1827, consisted of four 12's and two 6-inch howitzers, or four 8's and two 24-pound howitzers. In England in 1820 the horses for guns and wagons were increased from six and four to eight and six respectively. In 1822, and in 1829 in France the driver corps was abolished, men being enlisted as "gunners and drivers," and distributed among the battalions; naturally it worked ill, few men being adepts in gunnery and horse management at once. In 1848 in England, the horse artillery was raised from the two guns, to which it had been skeletonized after 1815, to four, and in 1852 to six, as was the foot artillery; and 20 batteries were formed, several more being added in 1855. Even so, this arm was badly undermanned, and deficient in both number and weight of guns, in the Crimean war, where it was organized in position batteries, with 18's and 8-inch howitzers; heavy field, with 12's and 32-pounder howitzers; field, with 9's and 24-pounder howitzers; horse, with 6's and 12-pounder howitzers; and mountain, with 3's and 4-inch howitzers—each field and horse battery having a rocket section. The French organization was horse artillery, with mounted gunners; line or field, with gunners riding on the ammunition chests; and siege or reserve, with gunners on foot. As the war consisted mainly of the siege of Sebastopol, the field artillery had little scope, though used with notable effect at the Alma and Inkerman, and mortar fire causing a frightful destruction in the Redan at the end; and the relatively great increase of range and accuracy in small arms over that of artillery (not then effective at more than a mile) was making the heavier arm subordinate. Later inventions have restored the balance.

Breech-loading and rifling now come into prominence. The earliest cannon were breech-loaders, a system quicker to charge, easier to clean, and more accurate in adjustment of missile to bore, and thus needing less windage than muzzle-loading. But till lately, mechanical science was not equal to its requirements of nice adjustment, and muzzle-loading superseded it. The defect of smooth-bores, with their straight projectile motion, is inaccuracy at long ranges;

ARTILLERY

since, as a projectile's centre of gravity rarely coincides with its longitudinal axis, the farther it goes the more its unevenness of mass carries it out of the initial path. A whirling motion corrects this by constantly restoring the balance and carrying it the other way; and this is provided by spiral grooving of the gun channel, which was invented by a German early in the 16th century, but like the other system, was in advance of mechanical development. In 1846 it was for the first time practically applied to ordnance, and rifled siege guns were used against Sebastopol, but they were still too imperfect for efficiency. In 1858 rifled 12's and 4's were adopted by France, and in the Franco-Austrian war of 1859 were used with great effect, increasing the accurate range from 1,450 to 2,500 yards, or nearly double; while the Austrians, for generations pre-eminent not only for handling but material, had only smooth-bore 6's and 12's, and 32-pounder howitzers, with the lesser range. The nature of the country stunted the service of artillery, but it was well developed at Solferino and brilliantly handled by the French at Medole. In 1860 the introduction of the Armstrong rifled breech-loader, first used in the Anglo-Chinese campaign of that year, led to a transformation of English artillery equipment: 7-inch guns, 82 hundredweight, for siege and garrison service, 40's for position batteries, 20's for same or heavy field, 12's of 8 hundredweight for light field, 9's of 6 hundredweight for horse. Field carriages were provided with a gun-metal "saddle" worked by lever and hand wheel, with elevating screw. Ammunition wagons were replaced by separate ammunition columns.

At the outbreak of the American Civil War, the United States, largely owing to Lieut. Rodman of the Ordnance Department,—inventor of the Rodman gun, whose casting by interior cooling and consequent density of channel metal, and its thickness at the seat of charge, enable it to bear a heavier charge without bursting than any other,—headed the world in artillery material: both quality and manufacture were unsurpassed. In 1861 it cast a 15-inch Rodman, the most powerful weapon known; and a 20-inch smooth-bore firing a 1,080-pound shot. Otherwise its equipment was:—Field: wrought-iron rifled 3-inch, range 2,800 yards; bronze 6's and 12's; "Napoleon" 12's, range 1,500 yards, used very effectively within it all through the war; howitzers—12's, 24's, and 32's, and mountain 12's. Siege and garrison: Cast-iron rifled, 4½-inch; 12's, 18's, and 24's; howitzers, 24's and 8-inch; mortars, 8-inch, 10-inch, and bronze Coehorn (a small light mortar for throwing grenades). Coast (most of it at once turned into field batteries): 32's; 8-, 10-, and 15-inch Columbiads (for both shot and shell, like the Napoleons); 10-inch and 13-inch mortars. There were 18 calibres altogether—7 of "guns," 3 of Columbiads, 4 of howitzers, 4 of mortars. Eastern armies began with four 6-gun batteries to each division, about half of them being used as a corps reserve when corps were formed; later the batteries were reduced to four, and in 1863 taken from the divisions as formerly from the battalions, being formed into artillery brigades of 4 to 12 batteries. In the Western armies each infantry brigade had a battery of artillery till 1863, when as in the East a massing system was

begun. In the Confederate armies each division had an artillery battalion of four batteries, and each corps two battalions as a reserve. This combined system has been substantially adopted by other powers. The Civil War greatly advanced the importance of artillery, and developed the Napoleonic massing system.

The short Austro-Prussian war of 1866 gave no time for new developments in military science, and in artillery service the victorious Prussians were as usual far behind the Austrians, though their material was better. They used for the first time steel breech-loading rifled guns, nominally 6's and 4's, but using 15-pound and 9-pound oblong shells with percussion fuse; the Austrians had muzzle-loading rifled 8's and 4's, in batteries of eight, employing the brigade system and rocket batteries for the last time. After this war they adopted breech-loading guns, and armed themselves from Krupp's factories.

By the time of the Franco-Prussian war in 1870 the Prussians had made great advances in artillery, and owed a part of their success to their superiority to the French, both in numbers, power, and tactics of this arm. They disused reserve artillery, attaching the batteries to divisions and corps entirely; each cavalry division had two batteries of horse artillery; they pushed their guns well in advance, preparing the way for infantry movements by concentrated fire on an objective point, and firing with deliberation at ranges from 650 to 3,300 yards; while the French wasted their fire at too long ranges, held it too long in reserve, and used it in small batteries instead of masses. Their mitrailleuses, first employed in this war, were a disappointment, though they inflicted great losses on the Prussians in carrying positions, especially when successfully masked, and clearly marked out the great future of machine guns; but for offensive work against field artillery they were not fitted. The Prussians used steel breech-loading 9's and 4's, 3.7 guns per 1,000; the French, muzzle-loading 8's and 4's, with some "Napoleon" 12's, 3 to 1,000.

In the Russo-Turkish war of 1878 nothing new of any sort was brought forward. The Turks had the better guns, the Russians much the greater number; the former used Krupp's steel breech-loaders of 3.2 and 3.5 inches, 2.2 per 1,000 men, the latter bronze breech-loading 9's and 6's, 3.9 per 1,000. In the Spanish-American war of 1898 there was little use for artillery; and the only novelty was the furnishing of smokeless powder after Santiago, when it was no longer needed. A 3.2-inch steel breech-loader and a 3.6-inch field mortar were used. As the siege train was not used, its composition is immaterial. In the Philippines and China 3.2-inch field and mountain guns were used. In the Boer war, owing to the nature of the country and the operations, artillery played but a small part, and developed no new weapons; the Boers, however, had for years laid in a stock of much more improved material than the English.

See ARMAMENT OF THE WORLD; ARMY; ARMY OF THE UNITED STATES; ORDNANCE; PROJECTILES. For ammunition see AMMUNITION; EXPLOSIVES; GUNPOWDER. For the relations of the artillery arm to other services see COAST DEFENSE; FORTIFICATION; SIEGE WORKS; TACTICS.

ARTILLERY COMPANY — ARUNDELIAN MARBLES

Artillery Company, The Ancient and Honorable, a military organization of Boston, Mass. It was copied from that of London, was formed in 1637, and was the first regularly organized military company in America.

Artillery Company, The Honorable, the oldest existing body of volunteers in Great Britain. It was instituted in 1585, and comprises six companies of infantry, besides artillery, grenadiers, light infantry, and yagers. It furnishes a guard of honor to the sovereign when visiting London.

Artillery Corps, the official name of the entire artillery service of the United States army.

Artillery Schools are institutions established for the purpose of giving a special training to the officers, and in some cases the men belonging to the artillery service. An artillery school at Fort Monroe, Va., first established in 1823, discontinued, and re-established in 1867, gives instruction, both theoretical and practical. The artillery regiments of the regular army have each one foot-battery at the school. The course of instruction is one year, beginning 1 September, and it includes such subjects as ballistics, sea-coast engineering, electricity, mines and mechanisms, artillery, coast-defense, chemistry, explosives, etc. In Great Britain the artillery schools are at Woolwich and Shoeburyness. The Department of Artillery endeavors at Woolwich to give artillery officers the means of continuing their studies after completing the usual course at the Royal Military College, and of qualifying for appointments requiring exceptional scientific attainments. The school of gunnery at Shoeburyness gives instruction in gunnery to officers and men and conducts all experiments connected with artillery and stores. See **MILITARY SCHOOLS**.

Artist's Letters from Japan, *An*, a work by the noted American artist, John La Farge. The drift of the book is toward a purer art; but it contains much lively matter—accounts of the butterfly dance in the temple of the Green Lotus, and of fishing with trained cormorants. A thread runs through the letters, tracing the character and progress of the usurping Tokugawa family, from the cradle of their fisherman ancestors to the graves of the great shogun and his grandson in the Holy Mountain of Nikko.

Ar'tocar'pus, the generic name of the bread-fruit tree (q.v.).

Artois, ä'r'twä', the name of a former province of France anciently one of the 17 provinces of the Netherlands. It was bounded on the south and west by Picardy, on the east by Hainault, and on the north by Flanders. It is now almost completely included in the department of Pas de Calais. Artois is a fertile region, producing grain and hops. Its capital was Arras.

Ar'totype. See **PHOTOGRAPHY**.

Arts, the designation of branches of study in the Middle Ages, originally called the liberal arts to distinguish them from the servile arts or mechanical occupations. These arts were usually classed as grammar, dialectics, rhetoric, music, arithmetic, geometry, and astronomy. Hence originated the terms "art classes," "de-

grees in arts," "master of arts," still in common use in universities, the faculty of arts being distinguished from those of divinity, law, medicine, or science.

Aru. See **ARRU ISLANDS**.

Aruba, a-roo'ba, an island belonging to Holland, off the north coast of Venezuela. It is a dependency of Caracao and is about 30 miles long by 7 broad. The climate is healthy. Pop. about 7,700.

A'rum, a small genus of tuberous tropical and subtropical perennial herbs (commonly called callas) of the natural order *Aracea*, with simple leaves and diversely colored convolute spathes, for which they are cultivated either under glass or, in the case of some hardy species, in the open air, as ornamental plants. The naked topped spadices bear staminate flowers just above the pistillate ones at the bases. The tender species are managed like the fancy-leaved caladium (q.v.); the hardy must be planted in rich soil in cool, moist situations and must be well mulched during the winter. *A. maculatum*, lords-and-ladies, cuckoo-pint, wake-robin, from Europe, is, with its many cultivated varieties, perhaps the best known hardy species grown in America. The leaves and corms are acid; but the latter when ripe contain starch which may be extracted and used as a food. In places where it abounds it has long been converted into a kind of arrow-root and has been proposed as a substitute for the potato, but the corms are too small for profitable culture. Some closely related native American plants of somewhat similar habit are skunk cabbage (q.v.), water calla (see **CALLA**), Indian turnip (see **JACK-IN-THE-PULPIT**). *Anthurium*, a well-known genus of greenhouse plants, is also nearly allied.

Arundel, ä'r'un-dël, **Thomas**, an English prelate, third son of Richard Fitz-Alan, Earl of Arundel: b in 1352; d. Canterbury, 19 Feb. 1413. He was Chancellor of England and Archbishop of Canterbury. He concerted with Bolingbroke to deliver the nation from the oppressions of Richard II, and was a strenuous opponent of the Lollards and followers of Wyclif.

Ar'undel, Thomas Howard, Earl of. See **ARUNDELIAN MARBLES**.

Arundel, a small town in Sussex, England, famous as containing Arundel castle, the family seat of the dukes of Norfolk. It is on the small river Arun and has a showy Roman Catholic cathedral erected by the Duke of Norfolk. Pop. (1901) 2,738.

Ar'undel Society, a society instituted in London in 1848 for promoting the knowledge of art by the publication of facsimiles and photographs. It was named for the collector of the Arundelian Marbles.

Ar'undel'ian Marbles, a series of sculptured marbles discovered by William Petty, who explored the ruins of Greece for Thomas Howard, Earl of Arundel, in the reign of the first Stuart kings, James I and Charles I, and devoted a large portion of his fortune to the collection of monuments illustrative of the arts, and of the history of Greece and Rome. These marbles arrived in England in the year 1627, with many statues, busts, sarcophagi, etc. John Selden published some of the inscriptions which he thought most interesting, under the title of

ARUNDO — ARYAN RACE

'*Marmora Arundeliana*' (1628). Henry Howard, Duke of Norfolk, grandson of the collector, presented them in 1667 to the University of Oxford, where they still remain. The whole collection of inscriptions was published by Humphrey Prideaux in 1676; by Michael Maittaire in 1732; by Chandler in 1763. These inscriptions are records of treaties, public contracts, thanks of the state to patriotic individuals, etc., and many of a private nature. The most curious and interesting is one usually known by the name of the Parian Chronicle, from having been kept in the island of Paros. It is a chronological account of the principal events in Grecian, and particularly in Athenian history, during a period of 1318 years, from the reign of Cecrops (1450 B.C.) to the archbishop of Diognetus (264 B.C.). The authenticity of this chronicle has been called in question, but has been vindicated by many of the most learned men.

Arun'do, a genus of grasses. See REED.

Arus'pices, Roman priests and prophets, who foretold events from inspection of the entrails of sacrificed animals. They observed, too, all the circumstances which accompanied or happened during the sacrifice; for example, the flame, the mode in which the animal behaved, the smoke. Their origin is to be sought for in Etruria. They were introduced into Rome by Romulus, where they flourished till the time of the emperor Constantine (337 A.D.), who prohibited all soothsaying on pain of death.

Arus'pices, *On the Reply of the*, an oration by Cicero. After Cicero's recall from exile different prodigies alarmed the people of Rome. The auspices being consulted, answered that the public ceremonies had been neglected, the holy places profaned, and frightful calamities decreed in consequence. Thereupon Clodius denounced Cicero as the cause of the misfortunes that menaced the city, and on the following day the orator replied in the Senate to the attack. The speech takes rank among the greatest of Cicero's orations, though he had little time for preparation, and suffered under the disadvantage of addressing an audience at first openly unfriendly.

Aruwimi, a'roo-wē'me, a river of equatorial Africa having its source in the hills to the west of Albert Nyanza and tributary to the Congo. Its length is a little over 800 miles and its breadth at its confluence with the Congo is about a mile. It is navigable up to Yambuya, but beyond that place there are many rapids. In its upper course it is called the Ituri. Stanley discovered its mouth in 1877 and traced a considerable part of its course in his search for Emin Pasha in 1887.

Arvak, ār'vak, in Norse mythology, one of the horses attached to the chariot of the sun.

Ar'val Brethren (*fratres arvales*), a college or company of 12 members elected for life from the highest ranks in ancient Rome, usually at the emperor's nomination. They were so called from offering annually public sacrifices for the fertility of the fields.

Arve, ärv, a river tributary of the Rhone, which it enters near Geneva after a course of about 50 miles. It flows through the valley of Chamouni, and many of the most famous resorts of Switzerland are found in its vicinity.

Arvic'ola, a genus of rodent mammalia belonging to the family *Castoridae*, though they have also close affinities with the *Muridae*, or mice.

Aryan (är'yän, or är'ī-än) **Languages**, an important language family frequently styled the Indo-European or Indo-Germanic family of tongues. They have reached a higher development than those of the second great family, the Semitic, and are far in advance of the next one—that comprising the Turanian tongues. Like the Syro-Arabian forms of speech they are inflectional; while those of Turanian origin are only agglutinate. Max Muller separates the Aryan family of languages primarily into a southern and a northern division. The former is subdivided into two classes: (1) The Indic; and (2) the Italic; and the latter into six: (1) The Celtic; (2) the Italic; (3) the Illyric; (4) the Hellenic; (5) the Windic; and (6) the Teutonic. It is often said that Sanskrit, spoken by the old Brahmins, is the root of all these classes of tongues. It is more correct to consider it as the first branch and assume the existence of a root not now accessible to direct investigation. As an illustration of the affinity among the Aryan tongues the common word daughter may be instanced. It is in Swedish, *dotter*; Danish, *datter*; Dutch, *dochter*; German, *tochter*; Old Hebrew German, *tohtar*; Gothic, *dauhtar*; Lithuanian, *duktere*; Greek, *thygater*; Armenian, *dustr*; Sanskrit, *duhitri*; the last-named word signifying primarily "milkmaid," that being the function in the early Brahman or Aryan household which the daughter discharged. Not only are the roots of very many words akin throughout the several Aryan tongues, but (a more important fact) so also are the inflections. Thus the first person singular of a well-known verb is in Latin, *do*; Greek, *didomi*; Lithuanian, *dumi*; Old Slavonic, *damy*; Zend, *dadhami*; Sanskrit, *dadami*; and the third person singular, present indicative of the substantive verb is in English, *is*; Gothic, *ist*; Latin, *est*; Greek, *esti*; Sanskrit, *asti*.

Ar'yan Race, a name of comparatively recent application, the ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It includes two branches, an eastern and western. The western comprises the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, the Basques of the Pyrenees, and the Finns of Lapland; the eastern comprehends those of Armenia, Persia, Afghanistan, and northern Hindustan. From a multitude of details it has been established that the original mother tongue of all these peoples was the same. It is supposed that the Aryan nations were at first located somewhere in central Asia, probably east of the Caspian and north of the Hindu Kush and Paropamisian Mountains. From this centre successive migrations took place toward the northwest. The first swarm formed the Celts, who at one time occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic people. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a later period the remnant of the primitive stock would seem to have broken up. Part passed southward and became the dominant

ARZACHEL — ASBEN

race in the valley of the Ganges, while the rest settled in Persia and became the Medes and Persians of history. It is from these eastern members that the whole family takes its name. In the most ancient Sanskrit writings (the Veda) the Hindus style themselves Aryas, the word signifying "excellent," "honorable," originally "lord of the soil."

Ar'zachel, a Jewish astronomer: b. in Spain about 1050. He discovered the obliquity of the ecliptic and compiled certain astronomical tables known as the "Toledo Tables."

Arzamas, a Russian town, the capital of a district of the same name, 340 miles east of Moscow. It possesses brickyards, tanneries, and tallow factories, and in the earlier half of the 19th century was distinguished for a school of painting which furnished the greater part of Russia with ikons or sacred pictures.

As, a word which the Romans employed in three different ways: to denote (1) any unit whatever considered as divisible; (2) the unit of weight, or the pound (*libra*); (3) a coin. The *as*, whatever unit it represented, was divided into 12 parts, or ounces (*unciae*). Scholars are not agreed on the weight of a Roman pound, but it was not far from 237.5 grains avoirdupois, or 327.1873 grammes, French measure. In the most ancient times of Rome the copper coin which was called *as* actually weighed an *as*, or a pound, but in 264 B.C. was reduced to 2 ounces, in 217 to 1 ounce, and in 191 to ½ ounce. In 269 B.C., when silver money was first struck by the Romans, the *as* was superseded as a money of account by the sestertius coined from the more precious metal.

As It Was Written, the title of a romance by Sidney Luska (Henry Harland), the scene of which is laid in modern New York. Sombre and tragic though it is, the romance shows unusual vigor of conception and execution and extraordinary intuitive knowledge of the psychology of the Jewish race.

As You Like It, the title of one of Shakespeare's comedies. Its realism lies in its gay, riant feeling, the fresh woodland sentiment, the exhilaration of spirits that attend an escape from the artificialities of society. The characters all meet in the forest of Arden, where "as you like it" is the order of the day.

A'sa, the third king of Judah. During the first 10 years of his reign his kingdom enjoyed peace and prosperity, but in the 11th year he was attacked by the Ethiopian king Zerah at the head of a vast army, which he completely routed. On his triumphant return Asa was met by the prophet Azariah, who encouraged him to persevere in the extirpation of idolatry. In the 36th year of Asa's reign Baasha, king of Israel, occupied Ramah, and proceeded to fortify it as a frontier barrier. Asa called in the aid of Benhadad, king of Syria, and recovered the city, but incurred the rebuke of the prophet Hanani for seeking help elsewhere than from the Lord. The incensed king threw the prophet into prison. He died after a prosperous reign of 41 years.

Asaba, a-sā'ba, a town in west Africa, on the Niger River, 150 miles from the coast. It is the seat of the supreme court, and contains the central prison, civil and military hospitals, and other public buildings. It is a place of large

present importance, and in the evolution of new English interests in Africa may become still more conspicuous.

As'afœt'ida is a gum resin obtained from the root of *Ferula fatida*. Although the United States pharmacopœia limits the producing plant, it is quite probable that asafœtida is obtained from two or even three or four species of *Ferula*, *F. narthex*, *F. fœtidissima*, *F. jascckeanum*. The main sources, however, are *F. fatida* and *F. narthex*. These are coarse herbs of the *Umbelliferae* family distributed throughout the eastern Asiatic provinces from Persia, Turkestan, Afghanistan. The root is cleaned from the leaves and while growing is cut off close to the ground. This is then covered with leaves and in five or six weeks a slice is cut off, and from the cut surfaces the juice exudes. This on thickening forms the asafœtida of commerce. The chemical composition is complex. It consists of resin, gum, ethereal oil, vanillin, and ferulic acid. Asafœtida is highly prized in the East as a seasoning. In medicine it is stimulant to the sympathetic nervous system and is an excellent carminative, and stimulant of unstripped muscle fibre. It is particularly valuable in expelling flatus from the peristalsis it induces. It is also used in hysteria, but in an empirical fashion. Its further study is desirable.

Asa'ma-Yama, a-sā'ma-yā'ma, an active volcano of Japan about 50 miles northwest of Tokyo, 8,280 feet high. Its latest destructive eruption was in 1783.

A'saph, the Levite and psalmist whom David appointed as leading chorister in the temple. It is supposed that his office became hereditary in his family, or that he founded a school of poets and musicians called, after him, "the sons of Asaph."

As'arabac'ca, a European herb. See ASARUM.

As'arum, a small genus of herbs of the natural order *Aristolochiaceae*, widely distributed in rich, shady woods throughout the northern hemisphere. They have odd chocolate or purplish, bell-shaped, three-lobed perianths containing 12 horned stamens. The flowers which are borne close to or upon the ground are hidden by the kidney-shaped or heart-shaped leaves. *A. canadense*, wild ginger, or Canada snake-root, is warmly aromatic and is sometimes used as a spice. It is common in the eastern United States and is often cultivated in wild gardens as are also the following species: *A. virginicum*, *A. arifolium*, both common from Virginia southward; *A. caudatum*, a Pacific coast species, *A. lemmoni* and *A. hartwegi*, both of the Sierra Nevada Mountains, the last found at altitudes of 4,000 to 7,000 feet. *A. europæum* is also cultivated. It was formerly used as an emetic, a role now played by ipecacuanha. Its leaves are still made into snuffs and are deemed efficacious as counter-irritants.

Asben, as-bēn', a kingdom of Africa, in the Sahara, with an area of about 49,000 square miles. It consists of a succession of mountain groups and valleys and attains in its highest summits a height of over 6,000 feet. The valleys, though separated by complete deserts, are very fertile. The climate is on the whole

ASBESTOS

healthy, and not unsuitable for Europeans. The principal vegetable productions are millet, wine, dates, senna, indigo, and various kinds of vegetables.

Asbestos, one of the most remarkable substances found in nature. It is a peculiar species of the hornblende family of minerals. Its composition is chiefly silica, magnesia, alumina, and ferrous oxide, and consequently unconsumable, hence its name. The fibres formed by the chemical combination above given are perfectly smooth, and in this respect are different from all other known fibres. Paradoxically, it is the link which completes the chain between the vegetable and mineral kingdoms, and is in fact a mineralogical vegetable possessing the curious properties found in both, for it is at once fibrous and crystalline, elastic and brittle, heavy as a rock in its crude state, yet as light as thistledown when treated mechanically. Added to this, its fibres, soft, white, and delicate, have, by their inherent quality of indestructibility, withstood the action of the elements since the world began; and through all the countless ages, during which the hardest rocks surrounding it have been reduced, this mineralogical mystery has remained intact, having successfully resisted the assaults of fire, acids, and time. Asbestos is found widely distributed throughout the world, although the principal supply of crude asbestos suitable for the manufacture of fireproof cloths and curtains comes from Canada, about 75 miles from Quebec. The Italian mineral has a fine, silk-like fibre, but is lacking in the essential characteristic of strength. The product obtained from South Carolina has a soft, woody, yellowish fibre, which quickly powders under pressure. The South African asbestos, as one might naturally infer, is of a dark slate or black color, with exceptionally long, strong fibres, but owing to its stiff and horny texture, it cannot be manufactured into a fine fabric, hence the superiority of the Canadian asbestos, and its large consumption in the United States.

The mining of asbestos differs radically from the mining of other minerals, since no shafts are sunk, but excavations are made in the open, somewhat after the manner of a stone quarry. Canadian asbestos, however, is found in narrow veins or seams about an inch and a quarter in thickness, and embedded in rock which is easily severed from it. The strata of asbestos, which may be vertical or horizontal, are found in practically detached deposits, and are as elusive as those of zinc-bearing ore, and can only be determined by exploring for them. The rock to which the mineral is attached shows on fresh fracture a serpentine mineral of a green shade containing finely divided particles of chromic and magnetic iron. The asbestos on cleavage presents a brilliant, dark-green surface by reflected light, but the fibres after they are detached are perfectly white. The act of separating the mineral from its matrix of rock is termed "hand cobbing," and after this process the mineral is shipped to various factories in the United States.

The process of manufacture begins by placing the asbestos mineral in a chaser mill, a machine comprising a rotating edge-wheel revolving at the end of a radial arm in a trough, which crushes the mineral, dividing the fibres without destroying them. The result is a snowy mass of mineral wool ready for winnowing, a

method of removing the minute particles of rock still clinging to the fibres very much like the winnowing of grain; this is done by means of a blast of air, which separates and blows away the foreign matter, leaving the fibres in a refined state and in proper condition for the third stage of manufacture. This is termed air fibre raising, and as the name implies, the fibres are raised by a current of air produced by a blower of large dimensions through a vertical pipe inclined at a small angle. The object of this procedure will be obvious, when it is stated that the air blown across the fibres causes those of coarser texture to be deposited in a compartment near the bottom of the pipe. The medium fibres will be projected a little higher, and these will fall into a second compartment. The finer fibres will be blown to a higher point, and there collected, while the dust will be carried to the top and deposited. The fibres are in this way sorted into different lots according to their texture, and are ready to be made into articles for which they are best adapted. The fluffy stuff now goes to the carding room, just as though it were genuine wool sheared from a sheep or pure cotton fresh from the plant on which it grows, instead of a mineral substance that in its original state was mined like a lump of anthracite coal. A carding machine, similar to that employed in preparing wool, cotton, or flax fibres before spinning, has been adopted by the manufacturers. The problem of mechanically combing these fibres was no small one, and the carding takes place in a machine having a large central rotating cylinder covered with card clothing, that is, strips of leather set with projecting wires termed teeth. Around the main cylinder there are a number of smaller cylinders, also provided with card clothing, which engages the teeth of the central cylinder rotating in the reverse direction. This machine straightens out the fibres and lays them parallel; after passing through the first breaker, they are fed into a second carding engine or breaker, which is set to a finer gauge than the preceding. A third and last carding process takes place in a machine called a finisher or condenser, when all the irregularities are eliminated, and the fibres are stripped from the final cylinder by means of a fly-comb and are converted into unspun threads, when they are delivered on a traveling apron or endless band, and are gathered into rows by reciprocating scrapers; they are then condensed, and the process is continued in the coiling cans. In spinning the yarn, the rovings are delivered to the spindles on a carriage, which then recedes, when the fibres are twisted, and returns when the spun asbestos yarn is wound on the spindles. The spinning frames do not draw the yarn, and no strain is placed on it until after it is twisted. This brings the manufacture of the fireproof material to a point where it is to be woven into cloth, packing, or other forms; for asbestos is used for divers other purposes than those appertaining to theatres.

While adulterated asbestos may be used in some of the mechanical arts, for theatrical hangings its purity should be 100 per cent; it then forms one of the safest barriers against the calamity of fire. As a matter of fact, much of that which is termed commercially pure asbestos cloth contains from 5 to 20 per cent of combustible matter, but absolutely pure Amer-

ASBJÖRNSSEN — ASCENDANTS

ican-made cloth may be obtained, where price is not a primary consideration. Not only is purity essential in asbestos cloth where used for protection against fire, but strength as well; and after asbestos is subjected to a high temperature, it has a tendency to powder, when, owing to its weight, it may break through, and its utility be impaired.

One of the leading manufacturers has made an improvement in weaving asbestos cloth for theatre curtains; it consists of two strands of asbestos spun around a strand of high-temperature-melting brass wire, so that the wire is completely embedded and concealed. These asbestos metallic strands form the warp, so that the threads run the long way of the cloth when finished. The weft, or filling-in cross threads, is made of plain, pure asbestos. Such a curtain will stand well under a severe high-temperature test without breaking. Not only theatre curtains, but set scenery of all kinds may be constructed of asbestos. Scenic artists find it more difficult to paint, but the finer textures may be utilized for this purpose; and although asbestos cloth does not take colors as satisfactorily as cheese cloth and burlap, yet its use should be provided for wherever audiences are to be assembled. Flooring and woodwork in general may be easily replaced by compressed asbestos fibre board, and it has been shown that the latter may be stained, polished, and finished to as high a degree as wood. All the upholstery should be of pure asbestos cloth, and carpeting is also made to take the place of the combustible vegetable and animal fibres now used so extensively. One of the peculiar properties of asbestos carpeting is that the longer it is in service, the tougher it becomes.

Asbestos is utilized in the arts in many other forms than cloth; it may be worked into a pulp, and a fireproof paper is obtained. This paper is now used on roofs, between walls, flooring, etc. Fireproof rope three eighths inch in diameter for the suspension of curtains and other uses is made, having a tensile strength of 1,650 pounds per foot. High-grade asbestos plaster is fireproof, soundproof, and hangs together with great tenacity when subjected to water. Asbestos mineral with rock as it comes from the mine costs \$200 per ton, but after it is stripped the long fibres are worth \$1,500 per ton. When these are made into cloth it sells for \$3 per square yard; when made into curtains, the sewing is done with asbestos thread.

Asbjörnsen, as-byörn'sën, **Peter Kristen**, a Norwegian folklorist: b. in Christiania, 15 Jan. 1812; d. there, 6 Jan. 1885. While pursuing botanical and zoological studies, and subsequently during various travels at government expense, he collected folk tales and legends, aided by his friend Jørgen Moe, with whom he published 'Norwegian Folk Tales' (1842-4); and 'Norwegian Gnome Stories and Folk Legends' (1845-8; 3d ed. 1870), pronounced by Jacob Grimm the best fairy tales in existence.

Asboth, ösh'böt, **Sandor (Alexander)**, a Hungarian-American soldier: b. in 1811; d. in 1868. He came to America with Kossuth in 1851, and became a United States citizen, serving in the Civil War in the Federal army, attaining the rank of a brevet major-general. He was United States minister to Argentina at the time of his death.

Asbury, äz'ber-i, **Francis**, the first bishop of the Methodist Episcopal Church in the United States. He was born in Handsworth, Staffordshire, England, in August 1745; d. in Spottsylvania, Va., 31 March 1816. He joined the local ministry of the Methodists at the age of 16, the itinerant ministry six years later, and was sent by John Wesley as missionary to America at the age of 25. In 1772 he was appointed by Wesley general superintendent of the connection in America, the duties of which office he exercised through the entire period of the American Revolution. Until the termination of the war, the Methodists of America had called themselves members of the Church of England, and their ministers laymen. They now considered the political changes of the country as separating them from that Church, and therefore established an organization for themselves. Francis Asbury was constituted the first bishop of the new Church (1784), which office he held till his death. During the 30 years of his episcopal labors he traveled annually from the Andros-coggin to the Gulf of Mexico, and from the Atlantic to the Mississippi, ordained not less than 3,000 preachers, and preached about 17,000 sermons. Identified with the religious interests of this country through the two great struggles which have so greatly modified our political and social character, he became eminently American in his sympathies and character, and left the mark of his native enthusiasm and energy upon the ecclesiastical history of the United States.

Asbury Park, N. J., a city and popular summer resort in Monmouth County, on the Atlantic Ocean, six miles south of Long Branch and 40 miles south of New York city. It is on the line of the Pennsylvania R.R. and the Central R.R. of New Jersey. It adjoins Ocean Grove on the north, being separated from it by Wesley Lake. It was founded in 1869, and given a city charter in 1897. It contains many hotels and boarding-houses, attractive summer dwellings, electric lights and street railways, a national bank, etc. It has a property valuation of more than \$3,000,000; and is rapidly becoming nearly as popular a winter as a summer resort. Asbury Park and Ocean Grove were originally laid out by members of the Methodist Episcopal Church for camp meetings and other purposes. Pop. (1900) 4,148; in summer, 25,000 and upward.

Ascalon, a ruined town of Palestine, on the sea-coast, 40 miles west-southwest of Jerusalem. It was noted during the Crusades, Godfrey de Bouillon gaining here a great victory over the Egyptians in 1099. Its site is now a complete scene of desolation.

Asca'nus, a son of Æneas and Creusa, who accompanied his father to Italy. He supported Æneas in his war with the Latins, and succeeded him in the government of Latium. His descendants ruled over Alba for 420 years. He is known also as Iulus.

As'caris. See ROUND-WORMS; THREAD-WORMS.

Ascend'ants, in law, the opposites to descendants in succession. When a father succeeds his son or an uncle his nephew, etc., the inheritance is said to ascend or to go to ascendants.

ASCENSION — ASCHAFFENBURG

Ascen'sion, an isolated volcanic island, near the middle of the South Atlantic Ocean, about lat. $7^{\circ} 55' S.$; lon. $14^{\circ} 21' W.$; area about 34 square miles. It belongs to Great Britain; is the sanatorium for the British West African squadron. There are about 400 inhabitants, mainly government employees and their families. Ascension is celebrated for its turtle, which weigh in many cases from 500 to 800 pounds. This island was discovered on Ascension Day, 1502, by the Portuguese, and hence its name; but it was never formally occupied by any nation till Great Britain took possession of it in 1815, after the transportation of Napoleon to St. Helena.

Ascen'sion, Right, a term employed in astronomy in allusion to the position of a star or other heavenly body. Such position is known when we know the right ascension and declination, these terms corresponding respectively to longitude and latitude as applied to the position of places on the globe. Right ascension is measured on the equinoctial or celestial equator, the first point of Aries being taken as the starting-point; and the right ascension of any star is the distance in degrees, minutes, and seconds from this point to the point where a great circle, passing through the star, cuts the equator. The right ascension is easily found by means of the sidereal clock, which, when the first point of Aries passes the meridian, gives the time as 0 hours, 0 minutes, 0 seconds. By noting on the clock the time at which the body is on the meridian, we obtain the right ascension in time, which may be converted into degrees, minutes, and seconds at the rate of one hour to 15° .

Ascen'sion Day, a religious festival of many churches in commemoration of the ascension of the Saviour and often called Holy Thursday. It is a movable feast, always falling on the Thursday but one before Whitsuntide. It does not appear to have been observed before the 4th century.

Asceticism is the exercise of the faculties in moral and religious practices, the application of St. Paul's comparison between an athlete's and a Christian's life (1 Cor. ix. 24, 27). It is negative, when the object of this exercise is to avoid evil, to curb vicious tendencies, moderate excessive passion, and deny the soul and body any indulgence which might become inordinate or unlawful, and whenever it implies active measures against such disorders as gluttony, sloth, anger, pride, and lust, by abstinence, fasting, watching, self-restraint, modesty, and habits conducive to continence. It is positive, when its object is the exercise or training in the virtues which perfect life, and the cultivation of the means most efficacious for this end, such as devout reading, especially of the scripture, meditation, prayer, examination of conscience, exertion, and sacrifice for the good of others, zealous promotion of good enterprises; in a word, anything that can help one to do what is best, constantly, unhesitatingly, and with facility. This is the aim of all true asceticism, whether based on the principles of natural or of positive and revealed law. This aim, as well as many of the means above enumerated, is found to some extent in Pagan and Jewish, as well as in Christian asceticism. The latter employs additional means of inculcating and developing

the habit of virtue, such as the religious life, divine worship, and in particular the sacramental system of the Church. Asceticism has some part in every rightly regulated life, even in one based on purely ethical principles; but in Christian life it is most systematic and far-reaching. The whole Christian economy depends on self-denial and the active pursuit of virtue according to fixed principles. Every sincere Christian is, accordingly, an ascetic, some are professedly so, men and women, whether in the conventual cloister or domestic circle, who strive to acquire by daily practice habits of virtue, and to advance in holiness. Naturally counsel and direction are needed in a matter so difficult, and it is for want of due attention to these that asceticism is often misunderstood, and is regarded by some as grotesque, a shield for certain excesses and extravagances, associated often with the external observances of communities like the Essenes, with the singularities of some hermits and anchorites, the frenzy of fanatics like the Flagellants, the exclusiveness of the Brahmins, the ablutions of the Mohammedan, the dream of men like those composing the Brook Farm Community. To appreciate asceticism in its normal exercise, one must study it in the examples of men and women noted for its exercise, or in the books whose guidance they followed, in works of the great ascetical and sermon writers, but chiefly in scripture, and in the life of Christ and of persons distinguished for holiness. See Kempis, 'Imitation of Christ'; Rodriguez, 'Christian Perfection'; Scaramelli, 'Ascetical Directory.'

Ascet'ics, a name anciently given to those Christians who devoted themselves to severe exercises of piety, and strove to distinguish themselves from the world by abstinence from sensual enjoyments and by voluntary penances. Hence those writings which teach the spiritual exercises of piety are termed ascetic writings. Even before Christ, and in the time of the early Christian Church, there were similar ascetics among the Jews, such as the Essenes, also among the philosophers of Greece, and in particular among the Platonics. The expression is borrowed from the Greek word *askēsis* (exercise), used to signify the spare diet of the athlete, who, to prepare themselves for their combats abstained from many indulgences.

Asch, äsh, a manufacturing town in the extreme northwest corner of Bohemia. It contains a large Protestant and a newly-erected Roman Catholic Church, a real-school, schools of design, weaving, etc. The inhabitants are mainly employed in cotton, woolen, and silk manufacture, bleachfields, and dye-works. Pop. (1900) 18,700.

Aschaffenburg, a-shā'fën-bürg, a town of Bavaria, 26 miles east-southeast of Frankfurt. The chief edifice is castle of Johannisberg, built in 1605-14. There is also the Pompeianum, an edifice built by King Louis of Bavaria, in imitation of the Casa del questore (commonly called the Castor and Pollux House) at Pompeii. The principal industries are the manufactures of colored paper, tobacco, and liquors. There are also large breweries, and an extensive trade is done in wine and timber. Aschaffenburg long belonged to the archbishops of Mainz. Pop. (1900) 18,091.

ASCHAM — ASCIDIAN

Ascham, ās'kām, **Roger**, an English scholar: b. Kirby, Wiske, Yorkshire, 1515; d. London, 30 Dec. 1568. While still a child, he was taken into the family of Sir Anthony Wingfield and educated with the latter's children. He made rapid progress in English and classical studies, and was taught archery by Sir Anthony himself. The same generous patron sent him in 1530 to St. John's College, Cambridge, where he read nearly all extant Latin literature, acquiring an elegant Latin style that proved most useful to him later, and developed an especial aptitude for Greek, which he taught to students younger than himself. Besides this, he paid some attention to mathematics, became an accomplished musician, and acquired remarkable skill in penmanship. He received his B.A. degree in February 1533-4, and became a Fellow of his college. His reputation for Greek learning soon brought him many pupils, several of whom later rose to distinction, and students from other colleges attended his lectures. In five years, he afterward said, Sophocles and Euripides had become at his college as familiar as Plautus had been previously, and Demosthenes was as much discussed as Cicero. The beauty of his handwriting and the purity of his Latin led to his being employed to write the official letters of the university. He took an active part in the controversy as to the correct mode of pronouncing Greek, opposing Sir John Cheke's system, but later adopting it. In 1543-4 he wrote his famous treatise on archery, 'Toxophilus,' and in person presented a copy of it to Henry VIII., who so approved of the work that he gave the author an annual pension of £10, which was renewed by Edward VI., whose Latin secretary Ascham became. In 1548 he was appointed tutor to Princess Elizabeth. He read with her all 'Cicero,' the greater part of 'Livy,' the 'New Testament,' in Greek, 'Isocrates,' 'Sophocles,' and portions of 'Cyprian' and 'Melancthon.' Two years later he was nominated secretary to Sir Richard Morysyn, ambassador to the Emperor Charles V. Their headquarters were at Augsburg, but Ascham made trips to Louvain, Halle, Innsbruck, Venice, and Brussels, visiting famous teachers and scholars. He lived on excellent terms with Sir Richard, reading Greek with him five days in the week. The death of Edward caused the recall of the embassy in 1553. Ascham became Latin secretary to Queen Mary and gave proof of his industry by writing for her within three days 47 letters to persons of high rank, of whom cardinals were the lowest in degree. With the accession of Elizabeth, he was continued in his offices and became in addition private tutor to the queen, reading several hours a day with her in the learned languages. She bestowed on him the prebend of Wetwang in York Cathedral 5 Oct. 1559. His last years were filled with anxiety and care due to domestic afflictions and pecuniary embarrassment. Between 1563 and his death he found relief in the composition of his best known work, 'The Scholemaster,' of which he completed two books. The first is a general discussion of education with arguments in favor of inducing a child to study by gentleness rather than by force. The second is an exposition of his famous method of teaching Latin, by means of "double translation," etc., a method which has received high praise from all subsequent writers

on the theory and methods of education. When Queen Elizabeth heard of Ascham's death, she is said to have exclaimed that she would rather have cast £10,000 into the sea than to have lost her tutor, Ascham. Scholars in England and on the Continent mourned for him, and expressed their grief in stately Latin verses. In English literature Ascham has a secure place on account of the strength and vigor of his English prose, highly Latinized though it was in construction and vocabulary. In an age when serious literary composition in English was cultivated but little, and regarded less, the famous words in his dedication of 'Toxophilus' to Henry VIII. sounded a noble and patriotic note. "Although to have written this booke either in Latin or Greeke . . . had been more easier and fit for my trade in study, yet nevertheless, I supposinge it no point of honestie, that my commodity should stop and hinder any parte either of the pleasure or profite of manie, have written this Englishe matter in the Englishe tongue, for Englishe men." His style is without the tricks that Lyby introduced, and has an easy flow and straightforwardness.

Bibliography.—By far the best edition of Ascham's writings is 'The Whole Works of Roger Ascham . . . with a Life by Dr. J. A. Giles' (3 vols. in 4 parts, Lond. 1864-5). This edition includes 295 Latin and English letters, many printed for the first time. 'Toxophilus' was first published in 1545; other editions appeared in 1571, 1589, 1788, 1821, 1865 (by J. A. Giles), 1868 (by E. Arber). 'The Scholemaster' was first issued 1570, and was followed by editions in 1571, 1572, 1573, 1579, 1583, 1589, 1711, 1743. Prof. J. E. B. Mayor published best modern edition in 1863, and E. Arber reprinted the first edition in 1870. The best exposition of Ascham's educational system is in R. H. Quick's 'Essays on Educational Reformers' (1868). Cf. also article by Sidney Lee in 'Dictionary of National Biography.'

Aschersleben, ā'sher-lā'bēn, a town of Prussian Saxony, in the district of Magdeburg. It is walled and entered by five gates, and contains several churches, a synagogue, and a real-school of the first class. There are manufactures of woolen goods, paper, sugar, artificial manures, earthenware, etc. Among several interesting ruins in the vicinity is the old castle of Askanien, the cradle of the house of Anhalt. Pop. (1900) 27,245.

Ascid'ian, a marine animal, so called from *Ascidia*, a genus of *Tunicata*. Ascidians were once regarded as mollusks, and afterward as worms, but when their embryology and early stages were studied and it was found that they passed through a tadpole-like stage, in which the tail is supported by a notochord, and that in other respects they approached the vertebrates, they were placed with the vertebrates in the group *Chordata*. The simple ascidians attain to a large size, *A. callosa* being about two inches in diameter, quite round, and in shape and color much like a potato. The "sea-peach" (*Cynthia pyriformis*) is of the size and general shape of a peach, with its rich bloom and reddish tints. It is common at a depth of 10 to 50 fathoms on both sides of the north Atlantic. While other forms, as *Bottemia*, are stalked and fixed to the bottom, certain pelagic forms, as *Pyrosoma*

ASCLEPIADACEÆ — ASELLIO

(q.v.) and *Salpa* (q.v.), are free-swimming. The compound ascidians, such as *Amaracium*, grow in white or reddish masses on sea-weeds, rocks, shells, etc., the individual animals being minute. The interesting form *Perophora* grows in bunches on piles and wharves on the southern coast of New England; it is perfectly transparent, so that the heart and circulation of the blood can readily be observed under the microscope. The heart is a straight tube, open at each end; after beating for a number of times, throwing the blood with its corpuscles in one direction, the beatings or contractions are regularly reversed, and the blood forced in an opposite direction. For a general account of the anatomy, development, and metamorphoses of these animals, see TUNICATA.

Asclepiada'ceæ, a natural order of more than 200 genera and 2,000 species of dicotyledonous herbs and shrubs, most of them with milky juice and many of them twining. The species are widely distributed in the temperate and tropical zones of both hemispheres and are especially abundant in Africa. They differ greatly in their characteristics and uses; some, like *Stephanotis floribunda*, are delightfully fragrant; others, like *Stapelia gigantea*, carrion flower, are repellantly odoriferous. Some species yield a fibre from their stems or their pods; some are used in medicine; others are planted for ornament. They are characterized by opposite or whorled, seldom scattered, entire leaves without stipules; umbels of symmetrical flowers, without calyx and with a five-parted corolla with often reflexed lobes; five stamens attached to the corolla and more or less united around the stigma; pollen grains more or less coherent; the ovary composed of two carpels; style short; stigma discoid; fruit a follicle or pod; seed flattened, with long silky hairs, which buoy it up in the air for dispersal; cotyledons flat. In the United States *Asclepias* (q.v.), or milkweed, is the principal genus. The more important genera are grouped as follows: TYLOPHOREÆ, *Marsdenia*, *Stephanotis*, *Cerepegia*, *Stephelia*, *Hoya*; GONOGLOBÆ, *Gonoglobus*; PERIPLOCHÆ, *Periplocha*, *Streptocaulon*; ASCLEPIADÆ, *Asclepias*, *Cynanchum*, *Vincetoxicum*.

Asclepiades, äs'kle-pī'a-dēz, the name of several ancient Greek writers—poets, grammarians, etc.—of whom little is known, as well as of several physicians, the most celebrated of whom was Asclepiades, of Bithynia, who acquired considerable repute at Rome about the beginning of the 1st century B.C.

Asclepias (milkweed, silkweed, swallow wort, the type genus of about 125 species of the natural order *Asclepiadaceæ* (q.v.), the species of which are mostly North American erect perennial weeds with thick, deep roots common in pastures and waste places. Some furnish a fibre strong enough for ropes, and the silky down attached to which is useless for spinning, is often used for stuffing pillows, etc. The young shoots of some species are occasionally cooked like asparagus, which they are said to resemble somewhat. *A. tuberosa*, butterfly-weed, pleuvisy root, common in dry banks and fields from Ohio to Georgia, is very showy and seems to deserve a place in the flower-garden. Other well-known American species are *A. rubra*, *A. purpurascens*, *A. syriaca*, etc. The few species

cultivated for ornament in America are mostly foreign. The genus is named in honor of the Greek god Æsculapius, since some of the species are reputed carminatives, sudorifics, and expectorants. Medicinally the milkweeds are of secondary value only. They are irritants, and cause nausea, vomiting, and diarrhoea. They also cause diuresis and diaphoresis, but their exact action is in need of investigation. The eclectic school have been the chief investigators.

Ascoli, äs'kō-lē, or **Ascoli Piceno**, äs'kō-lē pēchā'nō (the ancient Asculum), an Italian town, 90 miles northeast of Rome. The town, one of the most ancient in Italy, is well built, and contains many handsome edifices and noble mansions, and the remains of an ancient theatre, temples, etc. It has manufactories of woolen cloths, leather, hats, cream of tartar, china-ware, sealing-wax, paper, and glass. It has an active trade, and its port, at the mouth of the river Tronto, is much frequented by coasting vessels. Pop. (1901) 28,882.

Ascoli Satriano, äs'kō-lē sä'tre-ä'nō (anc. *Asculum Apulum*), a town of southern Italy, 20 miles south of Foggia. Pop. (1901) 8,550.

As'comyce'tes, a large and important group of fungi, so called from their spores being contained in asci or sacs. This group includes mildews, rusts, smuts, the truffle, the morel, and (according to Schwendener and other authorities) the lichens. See Engler and Prantl, 'Die Natürlichen Pflanzenfamilien.' See FUNGI.

Asco'nius (QUINTUS A. PEDIANUS), a Roman historian of the 1st century A.D., who wrote a life of Sallust, a reply to the critics of Virgil, and valuable commentaries to Cicero's orations, some of which are extant.

As'cot, a celebrated English race-course near the southwest extremity of the Windsor park. The annual races, which take place in the second week in June, are attended by the fashionable and sporting public. From the accounts of the Master of Horse for the year 1712, it would appear that they were instituted, not in 1727, as is commonly supposed, but by Queen Anne on 6 Aug. 1711.

Ascutney, äs-küt'nī, an isolated granitic mountain on the boundary between Windsor and Weathersfield, Vt. Its summit is 3,320 feet above tide-water; and from it is presented an extensive and beautiful prospect of the valley of the Connecticut.

As'dood, or **Asdoud**, a seaport of Palestine, on the Mediterranean, 35 miles west of Jerusalem. It was the Ashdod of scripture, one of the five confederate cities of the Philistines, and one of the seats of the worship of Dagon (1 Sam. v. 5). It occupied a commanding position on the high road from Palestine to Egypt, and was never subdued by the Israelites. It sustained against Psammetichus a siege of 29 years; was destroyed by the Maccabees, and restored by the Romans. It is now an insignificant village, from which the sea is constantly receding.

Aselli, a-sēl'lee, **Gasparo**, a famous Italian physician: b. Cremona about 1580; d. 1626. He was professor of anatomy and surgery at Padua, and in 1622 discovered the lacteal vessels, which he seems, however, never to have

ASELLUS — ASH

understood or described with complete accuracy. He left a treatise, 'De Lactibus' (1627).

Asellus, a fresh-water isopod crustacean, allied to the wood-lice (q.v.), common in ponds and standing water, under sticks and stones, and in open caves. These crustaceans differ from the common pill bugs of the land in having a pair of rather long forked two-jointed caudal appendages and antennæ of the second pair reaching to the telson. The body is broad and flat, with a broad shield-like telson, formed by the fusion of the last abdominal segments. There are six pairs of legs arising from the middle region of the body between the head and telson. The female carries her eggs under her breast, behind the head. Respiration is carried on by several pairs of broad, gill-like sacks appended to the broad, flat abdominal legs. Blind individuals occur in caves, which are allied to the true blind *Asellus caecidotæa*.

Asen, ä'sën, in northern mythology, the most powerful of the gods. They included 12 gods and the same number of goddesses, among the most renowned of whom were Odin, Thor, Baldur, Freyr, Frigga, Freyja, Idunna, Eira, and Saga. Their dwelling-place was Asgard. Though this worship was native only to the tribes of Scandinavia, its influence extended throughout ancient Germany, and may still be traced in many German proper names. Thus the German names of the days of the week, which through the Saxons became incorporated into the English language, are derived from this mythology. (See ASGARD.) Asen was also the name of several mediæval czars of Bulgaria.

As'enath, the daughter of Potipherah, priest of On, and the wife of Joseph (Gen. xli. 45, 50).

Asepsis. See ANTISEPTICS.

Asexual Generation. See PARTHENOGENESIS.

Asgard, äs'gärd, the home of the Æsir, or Asen, and the Olympus of northern mythology. The city of Asgard is fabled to have been built in the middle of Ida's plain, the very centre of the universe. Here the Æsir erected a court for themselves with seats for 12 and one high seat for Odin, the All-father, and also a lofty abode for the goddesses, called Vingolf. They worked diligently, played at games, were rich in gold and all precious things, and happy, till three maidens from Jotunheim, the giants' world, crossed Ida's plain and entered Asaheim, when corruption spread among its inmates. Asgard had many mansions, the largest and noblest of which was Gladseim; while another, not so spacious, but the fairest of all and brighter than the sun, was called Gimli. See SCANDINAVIAN MYTHOLOGY.

Asgill, äs'gîl, **John**, an eccentric English writer: b. Hanly Castle, 1659; d. 1738. He was bred to the law, and gained considerable reputation, not only by skill in his profession, but from his pamphlet declaring that man might pass into eternal life without dying. In 1703 he took his seat in the Irish Parliament, but was dismissed after four days on account of his so-called blasphemous pamphlet. In 1705 he sat in the English Parliament for Bramber; but in 1707 he was expelled, nominally on account of his unlucky pamphlet, but really perhaps because of

his debts. The remainder of his life he spent in the Fleet and King's Bench prisons, in one of which he died. He wrote a number of pamphlets on the Pretender and on the Hanoverian succession.

Ash (*Fraxinus*), a genus of about 50 species of hardy, ornamental trees of the natural order *Oleaceæ*, natives mainly of North America, Europe, and western Asia. The species are prized for street and park planting for which their usually tall pyramidal or broad-topped habits and light, green foliage, which turns yellow or purple in autumn but which falls early, makes them specially attractive. From the elegance of their forms several species, notably the first mentioned below, have been called the Venus of the forest; the oak being the Hercules. The leaves are rather large opposite, pinnate, and deciduous; the flowers greenish or whitish in panicles, appearing either before, with, or after the leaves; the fruits are rather small samaras. Since grass and other plants do not grow well in the immediate vicinity of the ash it is not a good lawn species. The common ash (*Fraxinus excelsior*), a native of Europe and western Asia, found in its perfection upon loamy soil, often attains a height of 120 or even 150 feet. It also thrives in exposed and elevated situations better than many other trees. Its naked flowers appear long before the leaves, which drop early in the autumn, but during the summer are very ornamental. Its leaflets are sessile and serrated toothed. Its tough, hard, white wood makes excellent fuel and is highly valued for turning (for carriage wheels especially) when the tree has grown rapidly, since the toughness is then very great. It is then particularly valuable for carriage shafts, ladders, handles of agricultural tools, such as rakes, pitchforks, and hoes, where pliability, toughness, and lightness are essential. For such uses its only important rival in America is the hickory. When gnarled, as it occasionally is, it is prepared like "curly" maple for cabinet work and furniture, specially fine-grained specimens being used as veneer. The bark is used to some extent in leather tanning. A large number of cultivated varieties have been produced, among which the most remarkable are: *Monophylla* (erroneously raised by some botanists to the rank of a species), with simple instead of compound leaves or with only one or two small leaflets at the base of the main leaf-blade; *albo-marginata*, the leaflets of which are bordered with white; *albo-variegata*, with mottled white and green leaflets; *aurea*, yellow branched; *aurea-pendula*, drooping yellow branches; *pendula*, one of the best weeping trees; *crispa*, with curled and twisted very dark green leaves. The American or white ash (*F. americana*), a very variable species common from New Brunswick to Florida and westward to Minnesota and Texas, but rare south of New Jersey, attains about the same size as the preceding species, but has lighter bark and leaves. The leaflets have short stalks and are entire. In rich, moist, dense woods the trunks often attain a height of 40 feet without a branch, thus furnishing valuable timber, which is used for the same purposes as that of the preceding species. There are many varieties which more or less resemble those of the common ash. The black or water ash (*F. nigra*), common in swamps and upon stream

ASH (*Fraxinus excelsior*)

1, 2 The unfolding of the bud 3 A shoot in flower 4, 5, 6 Androgynous flower, from different sides 7 The stamen, exposed with two anthers on their filament 8 The pistil 9 The seed-pod, exhibiting the hanging seeds 10 Section of the seed-pod 11 Spray of hanging fruit 12 Fruit laid open, exposing seed 13 The two lobes of the seed, showing inner and outer side 14 Seedling plant

banks from Nova Scotia to Minnesota and southward to Missouri and Virginia, often attains a height of 80 feet. Its wood is softer than that of the preceding, but, being tough and easily separable longitudinally into layers, is largely used for veneer, baskets, barrel staves and hoops. The name *F. sambucifolia*, by which this species is sometimes called, was given it because the bruised leaves smell like those of elder. The red ash (*F. pubescens* or *F. pennsylvanica*) is common in low ground from maritime Canada to Florida, being especially abundant in the swamps of Pennsylvania, Maryland, and Virginia. It is rare west of Ohio, though found as far west as Dakota and Minnesota. It resembles the American ash in uses and in general appearance. The interior of the outer bark of the branches is cinnamon color or red when fresh. The blue ash (*F. quadrangulata*), common in rich, dry, or moist woods from Michigan and Minnesota to Tennessee and Arkansas, and especially abundant in Ohio and Kentucky, attains a height of 80 to 120 feet. Its branches are more or less four-angled, hence the specific name, and the membranes which give the smaller branches this form are specially noticeable on the young shoots. The inner bark yields a blue color when steeped in water, hence the common name. The green ash (*F. viridis*), a species very widely distributed over Canada and the United States from ocean to ocean, is so called from the brilliant green of its young shoots. It is extensively planted to form wind-breaks in Minnesota and the Dakotas on account of its extreme hardness and because it is easily propagated by seeds and also because it grows very rapidly. It is less valued for its wood than the white ash, but is useful for fuel. The Carolina or water ash (*F. caroliniana*), also referred variously to *F. platycarpa* and *F. americana*) seldom exceeds 40 feet in height, but is noted for its very large leaflets. It is distributed from Virginia to Florida and westward to Arkansas and Texas, being most plentiful in swamps, along water courses and in damp, rich woods. Its wood is used like that of the white ash. *F. cuspidata*, a native of the southwestern United States and northern Mexico, is a shrub or small tree which seldom exceeds 20 feet in height, and on account of its conspicuous panicles of fragrant flowers is often planted in temperate climates for ornamental purposes. *F. velutina*, also sometimes referred to *F. pistaciaefolia*, another species of the same region, seldom attains a height of 50 feet, and not being hardy is confined to southern planting. The manna or flowering ash (*F. Ornus* or *Ornus europæa*), a native of southern Europe and western Asia, is a small tree 25 feet tall which resembles the common ash. It furnishes manna (q.v.), as does also *F. rotundifolia*, which by some botanists is considered a variety of *F. Ornus*. It is a native of Greece. Many other species are of botanical, economic, or ornamental interest, but probably none of as much importance as the species mentioned. The mountain ash (q.v.), a member of the natural order *Rosaceæ*, obtains its name from its ash-like leaves.

Consult: Nicholson, 'Dictionary of Gardening' (1888); Bailey and Miller, 'Cyclopædia of American Horticulture' (1900-2).

Ash, or Ash'es, the fixed residue obtained by burning any part of an organized substance in air. Ash usually contains the following, or some of the following, metallic and non-metallic elements:

Metals	Non-metals
Potassium	Chlorine
Sodium	Bromine
Calcium	Iodine
Barium	Phosphorus
Iron	Sulphur
Manganese	Silicon
Aluminum	Carbon
Copper	
Zinc	

These substances are combined in various forms in the living body of the plant or animal. They are derived from the soil in the case of plants, and chiefly from plants in the case of animals. Different parts of the animal or vegetable frame are characterized by differences in the ash which they leave when burned; thus ash of bones consists largely of phosphate of calcium; the animal fluids and the juices of plants contain chlorid of sodium; sea-plants leave an ash rich in alkaline carbonates and also characterized by the presence of bromids and iodids of the alkalis. (See BARILLA; KELP.) Many grasses contain large quantities of silica, which appears in the ash of these plants. An examination of the ash of plants often leads to important conclusions as to the most suitable manure to employ for enriching the soil in which the plants are to be grown.

Ashes.—The non-volatile, inorganic portion of an animal or vegetable substance left behind after incineration. Ashes consist of the most part of carbonates, sulphates, sulphids, silicates and phosphates of potassium, sodium, calcium, magnesium, manganese, and iron, with occasional admixture of unusual elements such as aluminum. In certain seaweeds iodine is a prominent constituent of the ash, and silica occurs in many rushes. The solid matters taken up by plants are not absorbed in anything like the proportions in which they occur in the soil whence they are derived. This is well illustrated by analyses of the ashes of different plants, growing side by side in the same soil. Thus Kerner gives four such analyses, made on the ashes of (1) the water-soldier (*Stratiotes aloides*); (2) the white water-lily (*Nymphæa alba*); (3) a stonewort (*Chara fætida*), and (4) a reed (*Phragmites communis*). The results, so far as potash, soda, lime, and silica are concerned, are as follows:

PERCENTAGE COMPOSITION OF ASH.

	Water soldier	Water lily	Stonewort	Reed
Potash	30.8	14.4	0.2	8.6
Soda	2.7	29.7	0.1	0.4
Lime	10.7	18.9	54.8	5.9
Silicic Acid	1.8	0.5	0.3	71.5

These four plants grew close together and the soil from which they drew their supplies was identical, so far as could be discovered. The stonewort, it will be seen, contained a very large quantity of lime, and barely a trace of potash, soda, or silica; while nearly three quarters of the ash of the reed consisted of silica, and there

ASH-FLY — ASHANTEE

was less than one ninth as much lime as was found in the stonewort. If we pass from the consideration of different plants growing in the same soil to that of the same plant growing in different soils, the results are equally surprising. Thus Kerner gives analyses of the ash obtained from the foliage and branches of the yew tree (*Taxus baccata*), the specimens analyzed being taken from soils rich in serpentine, limestone, and gneiss, respectively. The results are presented in the accompanying table. It will be seen that there are some slight differences in composition, but when the wide difference in the soils is taken into account it is remarkable that the proportions are so nearly alike.

Substance Found	Nature of Soil		
	Serpentine	Limestone	Gneiss
Silicic Acid	3.9	3.6	3.7
Sulphuric Acid	1.9	1.6	1.9
Phosphoric Acid	8.3	5.5	4.2
Iron Oxid	2.1	1.7	0.6
Lime and Magnesia	38.8	41.2	36.3
Potash	28.6	21.8	27.6
Carbonic Acid	14.1	23.1	24.4

One feature that was prominent in the analyses of the yew-tree ash has been purposely obscured in the table by counting the lime and magnesia together. It appears that when a plant needs a certain substance for its growth it will sometimes make use of another substance whose chemical properties are closely similar, provided the more desirable one cannot be had in sufficient quantities. Thus the ash of the yew-trees growing over limestone contained 36.1 per cent of lime and 5.1 per cent of magnesia; and that of the trees growing over gneiss contained 30.6 per cent of lime and 5.7 per cent of magnesia. The serpentine soil, however, was much poorer in lime than either of the others,—serpentine being composed almost entirely of magnesium, silicon, and oxygen,—and the trees growing upon this soil, being unable to obtain the necessary quantity of lime, accepted, in the place of the lime, an equal weight of magnesia, which strongly resembles lime in its chemical properties; the observed quantity of lime in these trees being only 16.1 per cent, while magnesia was present to the extent of 22.7 per cent. The ashes of plants show that in certain cases the plants from which they are obtained possess a wonderful power of collecting large amounts of some particular substance, even when this substance is present in the soil or water in which they are growing in such minute quantities that it can barely be detected by the most delicate chemical tests. For example, the sea-weeds of the North Sea are so rich in iodine that their ashes formed the chief supply of this substance for years,—in fact, until the extensive South American deposits of sodium iodide were discovered. It would naturally be inferred that the North Sea contains considerable quantities of soluble iodides; but the fact is, that no trace of iodine or of iodides has yet been detected in it, by the most delicate tests. Wood ashes have long been used as a source of potash, this substance being readily obtained from them by mere leaching with water. The greater part of the

potash of commerce is now obtained from other sources, but the leaching process is still in use in country places where wood ashes are plentiful, the potash so obtained being chiefly used for the manufacture of soap. Wood ashes are also valuable for fertilizing purposes, on account of the potash and phosphorus they contain.

Ash-fly, the gall-fly of the oak (*Cynips quercifolia*). See GALL; GALL-FLY.

Ash-leaved Ma'ple. See BOX ELDER.

Ash-Wednesday, the first day of Lent. The name is derived from the ancient custom of putting ashes upon the head as a symbol of humble repentance for sin. In the Roman Catholic Church it is part of the religious service on this day for the priest to put ashes on the forehead of each worshipper while kneeling at the altar rails. In the English Church and in the American Episcopal Church the day is observed with especial solemnity as the opening of the penitential season, and also in the Unitarian "King's Chapel," in Boston, Mass.

Ashantee, a-shān'tē, a negro kingdom of western Africa and practically a part of the British colony of the Gold Coast. Its boundaries cannot be stated with any definiteness, but its area may be roughly estimated at 10,000 square miles. It is in general hilly and is largely covered with forests. It is well watered and extremely fertile, but the climate is unhealthy. Among the trees are the baobab, palms, and cotton trees. The crops are chiefly rice, corn, sugar-cane, and yams, the last forming the staple vegetable food of the natives. The domestic animals are cattle, horses of small size, goats, and a species of hairy sheep. The larger wild animals are the elephant, rhinoceros, buffalo, lion, hippopotamus, etc. Birds are numerous and crocodiles and other reptiles abound. Gold is obtained, being found either in the form of dust or in nuggets. The Ashantees long made themselves well known as being warlike and ferocious, with a love of shedding human blood amounting to a passion. Human teeth and jaw-bones were worn as personal ornaments, and human sacrifices used to be frequent. On the death of a king or chief enormous numbers of victims were slaughtered with circumstances of revolting cruelty, and there were regularly recurring periods, at intervals of 18 or 24 days, called the great and little *adaï*, when human sacrifices were made. Notwithstanding this there exist among the Ashantees certain of the arts of civilization. They excel in the manufacture of cotton cloths and in the fabrication of articles in gold; they make good earthenware, tan leather, and make sword-blades of superior workmanship. The native government is a monarchy. The chief town is Coomassie or Kumasi. The British first came in contact with the Ashantees in 1807, when a treaty was concluded by the governor of Cape Coast with the king of Ashantee, acknowledging the sovereignty of the latter by right of conquest over the coast, including Cape Coast Castle. In 1823 war was proclaimed by the Ashantees against the British, and they succeeded in the following year in defeating a small body of troops led by the governor, who perished with almost all his officers; but in 1826 the Ashantees were completely defeated near Accra. At the close of another war, in 1831, the river Prah was fixed as the bound-

ASHBURNER — ASHEVILLE

ary between the Ashantee kingdom and the states protected by Great Britain, but the Ashantees soon began to interfere beyond the boundary. Early in 1873 the Ashantees again invaded the territory protected by Great Britain, and Gen. Wolseley (subsequently Viscount Wolseley) was now sent against them. The Ashantee general Amanquanta had concentrated his troops, 20,000 strong, at Amoaful, 20 miles from Coomassie. The British general led to the attack 1,481 English and 708 native troops, whom he formed into a square. The battle began on 31 January, on which day Amoaful was taken. The British continued to advance fighting, the enemy at the same time attempting to break in upon their rear by attacking the troops left at Fommanah. On the 4th Coomassie was entered. The loss of the British in killed and wounded was 300, and a large number ultimately succumbed to the climate. As the king refused to enter Coomassie to sign a treaty, the British set fire to the town and began their return march on the 6th. The treaty signed soon after stipulated that the king of Ashantee should renounce his claims to the protectorate over the allies of Great Britain; that free trade and open communication should be established with the coast, and that the king should pay an indemnity of 50,000 ounces of gold. The last condition was not faithfully observed, but the result of the war was greatly to weaken the power of the Ashantees. The conduct of King Prempeh, a successor of King Koffee, led to the dispatch of another British expedition, which in 1896 entered Coomassie without resistance, and received the abject submission of the king, who was taken and sent into banishment. A British resident has since been stationed in the country, which is now a British protectorate, subordinate to the governor of the Gold Coast, and will no longer be the scene of human sacrifices and slave trading. In June 1898 an agreement was arrived at between Great Britain and France with regard to the boundaries between their respective territories here. The population of Ashantee is estimated at from 1,000,000 to 3,000,000.

Ash'burner, Charles Albert, an American geologist: b. Philadelphia, 9 Feb. 1854; d. Pittsburgh, 24 Dec. 1889. He graduated at the head of his class at the University of Pennsylvania, and was appointed assistant State geologist in 1875. He originated a method of surveying and representing the geology of the anthracite coal fields which received the approbation of mining engineers throughout the world. He was also an accepted authority on the natural-gas fields. In 1886 he entered private practice as an expert and became closely associated with the Westinghouse interests. He prepared over 20 of the Pennsylvania State geological survey reports, and contributed to scientific and technical journals.

Ash'burnham, Sir Cromer, an English military officer: b. 1831. He served with distinction in the Indian Mutiny campaign, Afghanistan campaign, the Boer war (1881), the Egyptian, and eastern Sudan campaigns; and was subsequently governor of Suakim.

Ash'burton, Alexander Baring, Lord, an English statesman and financier: b. London, 27 Oct. 1774; d. 13 May 1848. He was the second son of Sir Francis Baring, and the affairs of

the famous mercantile house established by his father kept him employed in Canada and the United States for many years. In 1810 he became the head of the house of Baring Brothers, and in 1812 sat in Parliament for Taunton. He was created Baron Ashburton in 1835. He was appointed special ambassador to the United States in 1842 to settle the Northwestern boundary question and other matters in dispute between England and America. A street in Boston, known as Ashburton Place, was named in his honor.

Ash'burton River, a stream in western Australia flowing 400 miles and emptying into the Indian Ocean, lat. 22° S.; lon. 115° W.

Ash'burton Trea'ty, a treaty concluded at Washington in August 1842 by Alexander Baring, Lord Ashburton, and the President of the United States. It defined the boundaries between the United States and Canada.

Ash'by, Turner, an American soldier: b. 1824; d. June 1862. He entered the Confederate army in 1861 and became a brigadier-general. He was especially distinguished for his gallantry. He was killed in a skirmish at Harrisburg, Va.

Ashby-Sterry, Joseph, a well known English writer on the staff of the *Daily Graphic*. He is novelist and poet, as well as journalist, and among his published books are: 'Nutshell Novels' (1890); 'The Lazy Minstrel,' a collection of brilliant verse (1892); 'Naughty Girl, a Story of 1893' (1893); 'A Tale of the Thames in Verse' (1896); 'The Bystander, or Leaves for the Lazy' (1900).

Ashby-de-la-Zouche, äsh'bī-dē-la-zooch', a market town in Leicestershire, England, on the borders of Derbyshire, 17 miles northwest of Leicester. It has wide, well-paved streets, and its parish church of Saint Helen is a handsome building with stained-glass windows, carvings, and monuments. The Ivanhoe baths attract visitors, the waters being beneficial for some ailments. The ruins of Ashby Castle, well known to readers of 'Ivanhoe,' which received Mary Queen of Scots as a prisoner, are still visible. Pop. (1901) 4,700.

Ash'dod. See ASDOD.

Ashe, äsh, John, an American soldier: b. in North Carolina, 1720; d. 24 Oct. 1781. He was a member of the first Provincial Congress and served in the American Revolution as a brigadier-general of North Carolina troops. Asheville, N. C., was called in his honor.

Ash'er, the name of the eighth son of Jacob. He founded the tribe called after him, which occupied a fertile territory in Palestine along the coast between Carmel and Lebanon.

Asheville, äsh'vīl, N. C., a city and county-seat of Buncombe County, on the Southern R.R., near the French Broad River; 275 miles west of Raleigh. It is in a tobacco-growing region; has manufactories of cotton goods, shoes, ice, tobacco, and flour; and is widely famed as a winter and summer resort. The city is 2,350 feet above the level of the sea and is surrounded by impressive mountain scenery. It has the Asheville College for Young Women, Bingham Military School, Asheville School for Boys, Normal College and Collegiate Institute for Young

ASHEVILLE COLLEGE — ASHLEY

Women, Home Industrial School for Girls, Asheville Farm School for Boys, Industrial School for Colored Youth, an auditorium centrally situated seating 2,000, and free to conventions, weather bureau, three national banks, and nearly 50 hotels and boarding-houses. It has modern sewerage, electric light and gas plants, a water supply by 17 miles of pipe line from trout streams on the water shed of Mt. Mitchell, and an electric street car system with a trolley road to Sunset Mountains. In the suburbs are the grand estate of Biltmore, established by George Vanderbilt of New York city; one of the finest botanical gardens in the world; Pisgah forest, a hunting preserve of 84,000 acres; Riverside Parks; and Mount Beaumont, 2,800 feet high. Pop. (1900) 14,694.

Asheville College, a non-sectarian educational institution for women, in Asheville, N. C. It was organized in 1842, and at the end of 1899 had 17 professors, 135 students, and grounds and buildings valued at \$100,000.

Ashford, a market-town in Kent, England, pleasantly situated on the river Stour. There are corn and cattle markets, and the Southeastern Railway Company have their principal locomotive and carriage establishments here. Pop. (1901) 12,808.

Ashhurst, John, an American surgeon: b. 1839; d. 1900. He was graduated at the University of Pennsylvania in 1857; served as an army surgeon in the Civil War; became surgeon of several Philadelphia hospitals after his return; and was made president of the College of Physicians in Philadelphia in 1898. He held surgical chairs in the University of Pennsylvania; was a member of the principal medical and surgical associations of the country; and besides many individual publications edited the 'International Encyclopædia of Surgery' (1881-1886); and 'Lippincott's New Medical Dictionary.' He was the author of 'Injuries of the Spine' (1867); and 'Principles and Practice of Surgery' (1871).

Ashikaga, a'she-kā'ga, a town in Japan, 17 miles by rail from Tokyo. From the 9th to the 17th century it was of much importance as a seat of learning. It is now noted for its trade in silk and cotton. Pop. (1898) 21,348.

Ashkelon. See ASCALON.

Ashland, Ky., a city of Boyd County, situated on the Ohio River; on the Chesapeake & Ohio, Norfolk & Western, and other railroads. It was chartered as a city in 1870. Its manufactures include cut and wire nails, steel billets, sheet steel, leather furniture, etc., and it is a shipping point for iron ore and coal. Pop. (1900) 6,800.

Ashland, Ky., an estate in the suburbs of Lexington, famous as the home of Henry Clay. It consists of about 600 acres, 200 of which form a park similar to the large private parks of England. The house in which Mr. Clay lived was a plain structure, two stories in height. After his death the property passed by public sale into the hands of his eldest son, James B. Clay, who took down the old house and rebuilt it.

Ashland, Ohio, a town and county-seat of Ashland County; on the Erie R.R., 65 miles southwest of Cleveland. It has important manufactures, large trade, a national bank, and sev-

eral newspapers, and is the seat of Ashland University, a non-sectarian institution, founded in 1878. Pop. (1900) 4,087.

Ashland, Ore., city and county-seat of Jackson County; situated in the extreme southern part of the State, on the Southern Pacific Railroad, 341 miles south from Portland, and 431 miles northerly from San Francisco. Ashland is the seat of the Southern Oregon State Normal School, and has three public school buildings and eight church buildings. The city has an excellent municipal organization and police regulation. Ashland owns its own water system. There is an extensive electric-light and power plant, flour-mill, ice plant, sash and door factories, box factory, quartz-mill, foundry and machine shops, and three newspapers. The Southern Oregon Chautauqua Association is located here. There are valuable gold mines in the mountains near by, some of them almost within the city limits. In the vicinity are found great varieties of other valuable minerals, such as cinnabar, kaolin, marble, sandstone, etc. In the vicinity are many mineral springs, whose waters contain much in the way of medicinal properties. Pop. (1902) 4,000.

Ashland, Pa., a borough in Schuylkill County, in the valley of the Mahanoy, and on several railroads; 12 miles northwest of Pottsville. It is in the centre of the great anthracite coal field, has extensive mining industries, large machine shops, foundries, and factories, and contains the State Miners' Hospital, a national bank, public hall, and several churches. Pop. (1900) 6,538.

Ashland, Va., a town of Hanover County, situated on the Richmond, F & P. R.R., 17 miles north of Richmond. It is the seat of Randolph-Macon College. It was the scene of several battles during the Civil War. Henry Clay's birthplace is within seven miles of the town. Pop. (1900) 1,147.

Ashland, Wis., a city and county-seat of Ashland County, on Chequamegon Bay, Lake Superior, and several railroads; 80 miles east of Duluth. It has one of the finest harbors on the lake, and beside its general lake traffic is a shipping port for the hematite ore of the great Gogebic Iron Range. To accommodate its iron interests it has a number of enormous ore docks. Other important interests are lumber and brown stone. It has very large charcoal blast furnaces, used for the manufacture of pig iron, and since 1885, when the real development of the Gogebic iron mines began, the city has grown rapidly. Near by is the group of Apostles' Islands. The institutions include the North Wisconsin Academy, Sisters' Hospital (Roman Catholic), and Rhinehart Hospital. Pop. (1900) 13,074.

Ashlar. See MASONRY AND BUILDING.

Ashley, Anthony Evelyn Melbourne, an English statesman: b. 1836. He is the fourth son of the seventh Earl of Shaftesbury, and in 1882 succeeded Mr. Courtney as under-secretary of state for the colonies.

Ashley, Lord. See SHAFTESBURY.

Ashley, William James, an Anglo-American economist: b. London, England, 25 Feb. 1860. He was graduated from Balliol College, Oxford, in 1881; was Fellow of Lincoln College, Oxford; lecturer in history in Lincoln and Cor-

ASHMEAD-BARTLETT — ASHTAVAKRA

pus Christi, 1885-8, and professor of political economy and constitutional history at the University of Toronto, Canada, 1888-92. He has been professor of economic history at Harvard University since 1892. He has written 'James and Philip van Artevelde' (1883); 'Introduction to English Economic History and Theory' (1888-93); 'Surveys, Historic and Economic' (1900); edited 'Economic Classics'; translated Schmoller's 'Mercantile System,' and has contributed a large number of articles to English and American economic journals.

Ash'mead-Bartlett, **SIR ELLIS**, an English politician: b. Brooklyn, N. Y., 1849; d. London, England, 19 Jan. 1902. He was educated at Christ Church College, Oxford, and admitted to the bar in 1877. He was examiner of the education department, 1874-80; Conservative member of Parliament from Suffolk, 1885, and from Sheffield, 1885-1902; civil lord of the admiralty, 1885, 1886; and was knighted in 1892. His popularity with political audiences in the early 80's was second only to that of Lord Randolph Churchill, but he lost much of this influence in later years owing to his association with the Turks and Swazis—a connection which subjected him to considerable ridicule in the House of Commons and the press. His chief literary production was 'The Battlefields of Thessaly' (1897), a record of his experiences in the last war between Greece and Turkey.

Ash'mole, **ELIAS**, a celebrated English antiquary: b. Lichfield, 1617; d. 1692. He practised as a chancery solicitor till the breaking out of the Civil War, when he retired to Oxford and entered himself of Brasenose College, and engaged in the study of natural philosophy, mathematics, and astronomy. At the Restoration he received the post of Windsor herald and other appointments, both honorable and lucrative. In 1672 appeared his 'History of the Order of the Garter.' Other works of his are: 'The Antiquities of Berkshire' (1719) and his 'Diary' (1717). He presented to the University of Oxford his collection of rarities, to which he afterward added his books and MSS., thereby commencing the Ashmolean Museum.

Ashmolean Museum, a museum at Oxford University, founded by Elias Ashmole (q.v.) in 1679. The building was erected by Sir Christopher Wren in 1682.

Ash'mun, **GEORGE**, an American lawyer: b. Blanford, Mass., 1804; d. 1870. He served for several years in the legislature of his native State and was prominent in Congress in 1845-50. He presided over the Chicago Convention which in 1860 nominated Lincoln for the presidency.

Ashmun, **JEHUDI**, an American missionary: b. Champlain, N. Y., April 1794; d. Boston, Mass., 25 Aug. 1828. He prepared for the Congregational ministry, and became professor in Bangor Theological Seminary. Later he joined the Protestant Episcopal Church and edited one of its periodicals, 'The Theological Repertory.' He discovered his true vocation when he became an agent of the American Colonization Society and took charge of a reinforcement for the colony of Liberia in 1822. He found the colony utterly disorganized, but in six years his energy and ability had thoroughly reorganized it and he left it in a prosperous and orderly condition. He

died soon after his return to the United States. He wrote 'Memoirs of Samuel Bacon' (1822), and his own life was written by R. R. Gurley (1839).

Ashochimi, ash-ō-chē-mē, or *Wappo*. A tribe of North American Indians who formerly ranged in California from the geysers to Calistoga hot springs and in Knight's Valley.

Ashraf, a-schráf', a town in Persia, near the southern coast of the Caspian Sea, 56 miles west of Astrabad. It was a favorite residence of Shah Abbas the Great, and was adorned by him with splendid buildings, of which only a few miserable ruins now remain.

Ashtabu'la, Ohio, city in Ashtabula County, on Lake Erie, at the mouth of the Ashtabula River; 54 miles east of Cleveland; on the New York, C. & St. L., the Pittsburg, Y. & A., and the Lake Shore & M. S. R.R.'s. It is the centre of an extensive agricultural and dairying region, and has large manufactories of leather, woolen goods, and farm implements. It has a Carnegie public library, three national banks, city hospital, and numerous large buildings. Its extensive railroad and lake commerce makes it an important transfer shipping point, especially for iron and coal. The city was first settled in 1801, was organized as a township in 1805, and incorporated as a city in 1892. On 29 Dec. 1876, a railroad accident here at a high bridge over the river resulted in the loss of over 100 lives. The city is governed by a mayor and city council elected biennially. Pop. (1890) 8,338; (1900) 12,949.

Ash'taroth, a goddess anciently worshipped by the Jews. Ashtaroth is the Astarté of the Greeks and Romans, and is identified by ancient writers with the goddess Venus (Aphrodite). She is probably the same as the Isis of the Egyptians. In Scripture she is almost always joined with Baal, and is called god, Scripture having no particular word for expressing goddess. She was the goddess of the moon; her temples generally accompanied those of the sun, and while bloody sacrifices or human victims were offered to Baal, bread, liquors, and perfumes were presented to Astarté.

Ashtavakra, ash-ta-va'kra. In Hindu legend, the hero of a story in the Mahabharata. His father, Kahoda, devoted to study, neglected his wife. Ashtavakra, though still unborn, rebuked him, and the angry father condemned the son to be crooked (hence the name, from *Ash-tan*, eight, and *vakra*, crooked). At the court of Janaka, king of Mithila, Kahoda was defeated in argument by a Buddhist sage and was drowned in accordance with the conditions. In his 12th year Ashtavakra set out to avenge his father, and worsted the sage, who declared himself to be a son of Varuna sent to obtain Brahmins to officiate at a sacrifice. Kahoda was restored to life, and commanded his son to bathe in the Samanga River, whence the boy becomes perfectly straight. In the Vishnu Purana some celestial nymphs see Ashtavakra performing penance in the water and worship him. He promises them a boon and they ask the best of husbands. When he offers himself they laugh in derision at his crookedness. He cannot recall his blessing, but condemns them to fall into the hands of thieves.

ASHTON — ASIA

Ash'ton, John, an English antiquarian: b. London, 22 Sept. 1834. He has published a long list of works on history, chap-books, legends, ballads, manners, and customs, caricature and satire, among which are 'Social Life in the Reign of Queen Anne' (1882); 'History of the Chap-books of the 18th Century' (1882); 'Social England under the Regency' (1890); 'When William IV. was King' (1896); 'Gambling in England' (1898); 'Florizel's Folly' (1899).

Ashton, Lucy, the heroine of Sir Walter Scott's novel, 'The Bride of Lammermoor.' Engaged to a man she loves, she is forced to marry another, and dies a maniac on her wedding day.

Ashton'-in-Mak'erfield, a town of Lancashire, England, 15 miles from Manchester, and noted for its potteries, collieries, and cotton-mills. Pop. (1901) 18,700.

Ash'ton-Un'der-Lyne, a market-town of Lancashire, England, 6 miles east of Manchester, on the north bank of the river Tame. It was an ancient Saxon town; the most interesting building is the parish church built in the reign of Henry V. Since 1769 it has grown rapidly through the extension of the cotton manufacture, both the spinning of cotton yarn and the weaving of calicoes being carried on in the town to a great extent. Upward of 20,000 work people are employed in factories. There are also collieries and iron-works in the neighborhood which employ a great many persons. Pop. (1901) 43,900.

Ashura'da, a small island in the south-east corner of the Caspian Sea. It is occupied by Russia as a naval and trading station.

Asia, the largest of the five continental divisions of the earth, lying eastward of the European and African continents, and separated from the American continent by Bering Strait and the Pacific Ocean. It is bounded north, east, and south, respectively, by the Arctic, Pacific, and Indian Oceans, with their various branches and inlets; it is divided from Africa on the southwest by the narrow isthmian Suez Canal; and is connected with Europe on the northwest across the whole breadth of that continent. The natural western boundaries are the Ural Mountains, the Caspian Sea, Caucasus Mountains, the Black Sea, Ægean Sea, the Mediterranean and Red Seas. The sinuosities of the Asiatic coast are very extensive; on the south the chief ocean inlets are the Gulf of Aden; the Arabian Sea with its inlets, the Gulf of Oman, the Persian Gulf, and the Gulfs of Cutch, Cambay, and Manar; and the Bay of Bengal containing the Gulf of Martaban. On the eastern or Pacific coast proceeding northward the principal indentations are the China Sea with the Gulfs of Siam and of Tonkin; the Tung-hai or Eastern Sea; the Hwang-hai or Yellow Sea with the Gulf of Pechili and Korea Bay; the Sea of Japan with the Gulf of Tartary; the Sea of Okhotsk; and Bering Sea with the Gulf of Anadyr. On the north or Arctic coast are the Nordenskjöld Sea and the Kara Sea with the Gulf of Obi. The coast line is about 35,000 miles, giving a proportion of one mile of coast line to 496 square miles of surface. From the extreme southwestern point of Arabia, at the Strait of Bab-el-Mandeb

to the extreme northeastern point of Cape Deshnef or East Cape, the length of Asia is about 6,900 miles, its breadth from Cape Chelyuskin or Northeast Cape in Siberia to Cape Romania, the southern extremity of the Malay Peninsula, is about 5,300 miles. The total area is estimated at 17,296,000 square miles. The most prominent features of the southern coast are the three great peninsulas of Arabia, India, and the Indo-Chinese Peninsula. The east coast is also flanked with insular and peninsular projections, forming a series of sheltered seas and bays. A series of large islands extends to the southeast of the continent, forming a connection with Australia; while a multitude of smaller islands are scattered over the Pacific and Indian Oceans. The principal peninsulas on the east are Kamchatka and Korea. The larger islands, proceeding from the northeast coast, are Saghalien, the Japanese Islands, the Philippine Islands, Borneo, Sumatra, Java, Celebes, the Moluccas, Papua or New Guinea, which, however, is Australasian rather than Asiatic, and lastly Ceylon at the southeastern extremity of the Indian Peninsula. The Kurile Islands, between Kamchatka and Japan, the islands of Loo Choo, Formosa, and Hainan on the Chinese coast, and the Andaman and Nicobar islands in the Indian Ocean, may also be noticed. On the west or Mediterranean coast the principal islands belonging to Asia are Cyprus and Rhodes. The northern coast, from East Cape or Deshnef, in Bering Strait, and on the Arctic Circle, to the Yalmal Peninsula, in the extreme northwest, is almost entirely contained within that circle. The highest point, Cape Chelyuskin, is about 78° N. The largest group of islands on the north coast is the Liakhov Islands (New Siberia); the largest indentation is the Gulf of Obi, which reaches below the Arctic Circle, and receives the river Obi about that latitude.

Mountains.—The mountain systems of Asia are of great extent, and their culminating points are the highest in the world. There are also vast plateaus and elevated valley regions, but large portions of the continent are low and flat. Such are the greater portions of Siberia, from the Ural Mountains across the north of the continent, and the western central region of the continent, where an area of great depression culminates in the Caspian. The greatest mountain system in Asia, and so far at least as altitude is concerned, of the world, is the Himalayan system, the principal mass of which lies between lon. 65° and 110° E. and lat. 28° and 37° N. It thus occupies a position not very far from the centre of the continent, though nearer the southern edge than the northern. It extends, roughly speaking, from northwest to southeast, its total length being about 2,000 miles, while its breadth varies from 100 to 500 or 600. Different names have been given to different portions of the system, such as Hindu Kush (the northwestern extremity), Karakoram, and Kuen-Lun, while Himalaya is more especially confined to the portion forming the northern barrier of Hindustan; but all these are really portions of the same connected mountain mass. The Kuen-Lun simply forms the northern flank of the mass, and is not, as it has been represented, a distinct chain; while the Karakoram Mountains have so little to distinguish them from the rest of the elevated mass

ASIA

to which they belong that they may be crossed without the traveler being aware of it. The broadest part of the system, the elevated table-land of Tibet, lies between the Himalaya proper and the Kuen-Lun. The Tibetan Mountains are connected on the east with the mountains of China and with those that spread to the southeast over the Indo-Chinese Peninsula. The Thian-Shan is another great mountain system of Central Asia connected with the Himalayan system by the important Pamir Plateau or "roof of the world" in lon. 70° - 80° east; lat. 37° - 40° north. The point of junction forms "a huge boss or knot," from which the Thian-Shan runs northwestward for a distance of some 1,200 miles. Between these two systems, which curve round it on the west, lies eastern Turkestan, right in the centre of Asia. The greatest elevations of the Himalayan system are to be found among the Himalayas proper, where is Mount Everest, 29,002 feet high, Kunchinjunga, 28,156, etc. The principal passes here, which rise to the height of 18,000 to 20,000 feet, are the highest in the world. The Kuen-Lun summits reach a height of 22,000 feet. The Himalayas descend by successive slopes to the plain of northern India, which has an elevation of about 1,000 feet above the level of the sea. The Vindhya cross the peninsula, dividing northern from southern India; the latter is further bounded by the eastern and the western Ghats, which run along the coasts; while the interior consists of elevated tablelands rising toward the south, where they attain in the neighborhood of the Nilgiri Hills an elevation of 7,000 feet. The Himalayas are not only connected with the mountains in the interior of India, and with ramifications into China and the Indo-Chinese peninsula, but on the west with the mountains of Baluchistan and Afghanistan. The Suliman and Hala ranges bound India on the west, and unite with the mountains of Baluchistan; while the Hindu Kush, passing westward through the north of Afghanistan, has continuations more or less distinct through Persia to the Elburz range south of the Caspian, and so onward to Mount Ararat. From this point again it forms connections with the mountains of Armenia, with the Caucasus, with the Taurus range in Asia Minor, and with the mountains which run to the south of Persia. The mountains belonging to this series form the boundaries of an elevated plateau extending from the Mediterranean to the Indus. On the north they are frequently of great elevation, Mount Demavend in the Elburz range reaching the height of 18,460 feet, while Ararat is nearly 17,000. The Thian-Shan system is continued to the northeast by the Altai and Sajansk ranges, the whole separating the Chinese Empire from Russian Turkestan and Siberia. Tengri-Khan in the Thian-Shan Mountains is estimated to have a height of 21,320 feet. A line of moderate elevation extends from the Altai westward to the Ural Mountains. To the east of the Sajansk range the Yablonoi Mountains run northeast toward the coast, along which they are continued northward under the name of Stanovoi to Bering Strait.

Table-lands, Plains, and Deserts.—Tibet forms the most elevated table-land in Asia, its mean height being estimated at 15,000 feet. Its surface is very rugged, being intersected by a

number of mountain ranges running generally in an easterly and westerly direction. On the east it is bounded by lofty mountains which separate it from China. Some of the largest rivers of southern and southeastern Asia have their origin in Tibet, including the Indus, the Brahmaputra, the Yang-tse, and the Hoang-Ho. In this region, a numerous series of lakes run in a chain parallel to the Himalayas. Another great plateau, much lower, however, than that of Tibet, is the plateau of Iran, occupying a large portion of western Asia, extending from the Indus to the Mediterranean, and from the Persian Gulf to the Caspian Sea. It comprises the countries known as Afghanistan, Baluchistan, Persia, Armenia, and Asia Minor. It lies at altitudes varying from 2,000 to 8,000 feet above the sea. The eastern half of it consists to a large extent of unproductive wastes. Of great political and strategical importance at the junction of Turkestan, Afghanistan, and India, is the Pamir Plateau, already alluded to, called by the natives "the roof of the world." Its valleys are at an elevation of from 11,000 to 13,000 feet above the sea. Another table-land of smaller extent and elevation is the Deccan Plateau, India, south of the parallel of lat. 25° N. The principal plain of Asia, as already mentioned, is that of Siberia, which extends along the north of the continent and forms a vast alluvial tract sloping to the Arctic Ocean, and traversed by large rivers, such as the Obi, the Yenisei, and the Lena, that convey its drainage to that ocean. Vast swamps of peat-mosses called tundras cover large portions of this region. Southwest of Siberia, and stretching eastward from the Caspian to the Thian-Shan Mountains, is a low-lying tract, consisting to a great extent of steppes and deserts, and including in its area the Sea of Aral, Bokhara, Khiva, and other districts. This is a region of internal drainage, the rivers, among which are the Amu Daria and the Syr Daria, either falling into the Sea of Aral or into other smaller sheets of water. In the east of China there is an alluvial plain of some 200,000 square miles in extent, most of it productive and highly cultivated; in Hindustan there are plains extending for 2,000 miles along the south slope of the Himalayas; and between Arabia and Persia, watered by the Tigris and Euphrates, is the plain of Mesopotamia or Assyria, one of the richest in the world. Of the deserts of Asia the largest is that of Gobi, which is bounded on the north by the Yablonoi and Thian-Shan Mountains, on the south by Tibet, on the east by the Khingan Mountains on the borders of China; while in the west it extends into eastern Turkestan. Large portions of it are covered with nothing but sand or display a surface of bare rock. This desert forms a large part of the country known as Mongolia, the whole of which forms an area of internal drainage, deficient in rainfall. There are also extensive desert tracts in Persia, Arabia, and Hindustan. An almost continuous desert region may be traced from the African desert through Arabia, Persia, and Baluchistan to the Indus.

Rivers and Lakes.—Asia contains some of the largest rivers in the world. It is remarkable among the continents for the number of its rivers, some of them of large size, that never find their way to the ocean, their waters either

ASIA

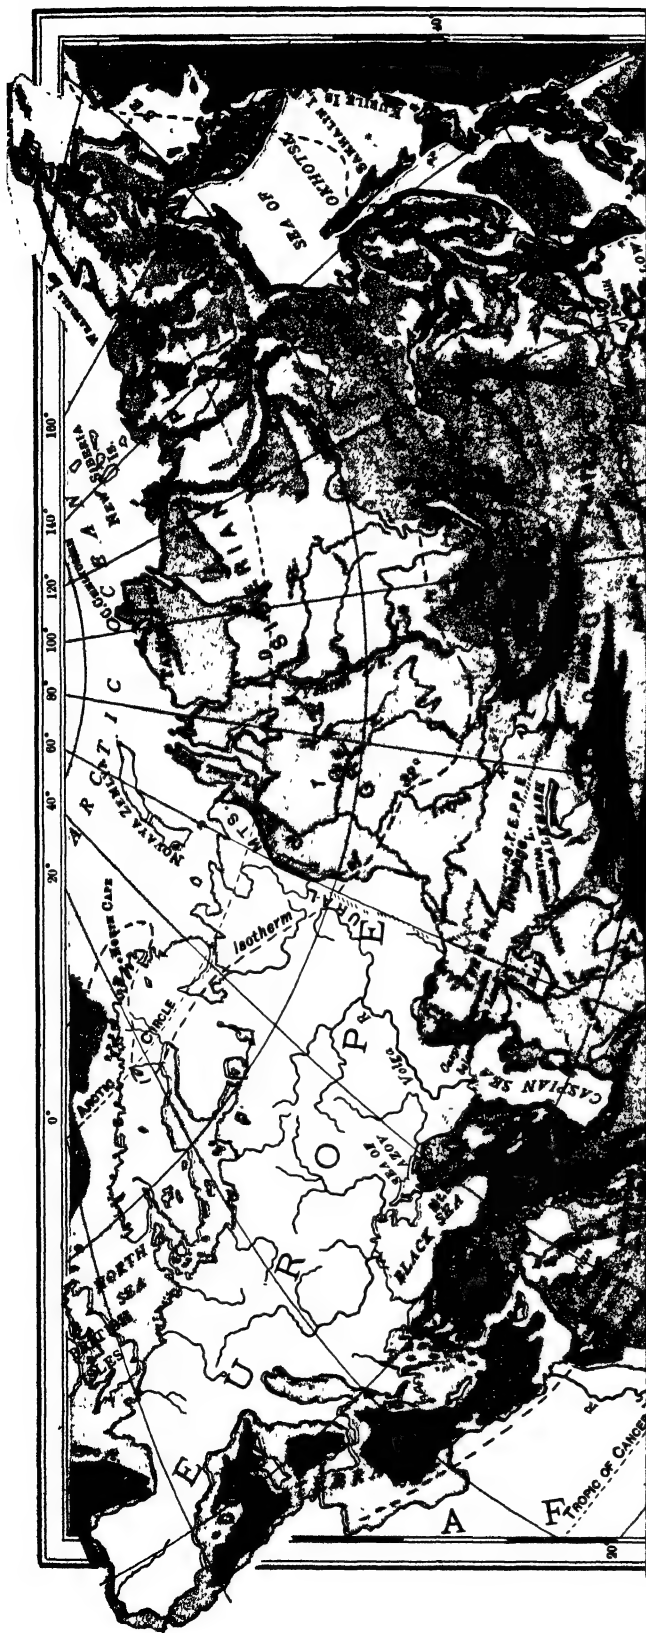

being lost in the sand or falling into lakes that have no outlet. The chief rivers in western Asia are the Tigris and Euphrates, that rise in the Armenian plateau and fall into the Persian Gulf; the Indus, from the Tibetan plateau, flows through northwestern Hindustan and falls into the Arabian Sea; the Ganges, which rises in the Himalayas and flows eastward through northern Hindustan, and the Brahmaputra, which rises in Tibet and flows through Assam and Bengal, both enter the Bay of Bengal; the Irrawaddy and the Salween, rising in the mountains of the Indo-Chinese Peninsula, and both flowing through Burma, likewise enter the Bay of Bengal; the Mekong or Cambodia, the largest river of this peninsula, has its sources in the same mountains, and flowing southeastward enters the South China Sea; the Yang-tse and the Hoang-Ho, the two great rivers of China, rise in the Tibetan plateau; and enter the ocean after a winding easterly course; the Amur, the only other great river of eastern Asia, rises in Mongolia, and after a circuitous course enters the Sea of Okhotsk; the great rivers of northern Asia, the Lena, Yenisei, and Obi, have already been mentioned. The Yenisei is believed to have a length of 3,400 miles, the Yang-tse of at least 3,000, the Lena of 2,770, the Hoang-Ho of 2,600. The basin of the Obi, including of course those of its tributaries, the Tobol and the Irtysh, is believed to be the largest of any river in the world, except the Amazon and the Mississippi, being considerably over 1,000,000 square miles in area.

The largest lake of Asia is the Caspian Sea, which, however, is partly in Europe, its largest tributary being the Volga. The chief Asiatic rivers falling into this sea are the Kur from the Caucasus, the Aras from Armenia, and the Atrek from northern Persia—the river Ural being partly European, partly Asiatic. The Caspian lies in the centre of a great depression, being 83 feet below the level of the Sea of Azof. East from the Caspian, as already mentioned, is the Sea of Aral, which, like the Caspian, has no outlet, and is fed by the rivers Amu Daria and Syr Daria. Its area is estimated at 27,000 square miles. Still farther east, to the north of the Thian-Shan Mountains, and fed by the Ili and other streams from this system, is Lake Balkash, a somewhat crescent-shaped sheet of water, with an area of 8,400 square miles. The lake has no outlet; its water is clear but very salt and disagreeable. There are also several other smaller lakes in this region, such as Issik-Kul, Kara-Kul, Ala-Kul, Baratala, etc. In the south of Siberia, between lon. 104° and 110° E., is Lake Baikal, a mountain lake from which the Yenisei draws a portion of its waters; its area is estimated at about 12,500 square miles. In the very centre of the continent is the Lob Lake, or Lob Nor, to which all the drainage of eastern Turkestan converges, being conveyed to it by the Yarkand, Kashgar, and other streams. These unite to form the Tarim River, which, from the source of the Yarkand, has a total length of over 1,200 miles. Lob seems to be rather a swampy tract than a lake proper. On the borders of Afghanistan, Persia, and Baluchistan, is a similar swampy lake that receives the Helmund and other streams from Afghanistan. Of the numerous lakes in Tibet Dangra-yum Nor and

Tengri Nor seem to be the largest; the former is 45 miles long and 25 broad.

Geology.—Though in population and history the most ancient continent, geologically speaking Asia is considered, as regards its present aspect, to be one of the newest. The principal mountain chains are composed largely of granitic rocks. The Himalayan range of mountains bears a striking resemblance in geological structure to the Alps; they are composed of granite gneiss and mica-schist, with syenite and amphibolites or trap-rocks, particularly primitive greenstone; the Altai Mountains contain granite in layers without alternation of gneiss, argillaceous schist in contact with greenstone, and containing augite, jasper, calcareous rocks, argentiferous lead ore, and copper. The ramifications of the Altai into Russian Asia contain also coal-grit, schists, quartz, and greenstone, rich with lead, silver, and auriferous sand. The lower ranges are covered with transported layers of rolled stones of granite, gneiss, and porphyry, in which are found agates, carnelians, and chalcidones. In the Kuen-Lun group are found rubies, lapis-lazuli, and turquoises. In the eastern part of the Urals the granite, of which the chain is composed, along with gneiss and other rocks, is extremely rich in iron and copper. The Caucasus contains granite, argillaceous schist, and basaltic porphyry. The great plains of northern India, Mesopotamia, central Asia, and Siberia are regarded as of very recent geological origin. From various indications many geologists are of opinion that the greater part of western Asia was occupied at no very distant period by an ocean, of which the Caspian and Aral Seas are the remains. It is also conjectured that a continental area extending across the Indian Ocean united Asia during the Permian period to Africa and Australia. Siberia is supposed to have been twice submerged during the Palæozoic and the later Tertiary period. A line of volcanic action extends on the eastern coast from Kamchatka through the Philippines and the Malay Archipelago to Aracan in the Bay of Bengal. In Kamchatka there are eight or nine active volcanoes; in the interior of the continent there appear to be none at present active.

Climate, Soil, etc.—The size of Asia, the great altitudes and depressions of the continent, along with the variations of latitude and the disposition of sea and land, etc., afford an inexhaustible source of complexity in the variety and distribution of climate. In Tibet, with a mean elevation of about 15,000 feet, the climate is rigorous, combining great cold with drought; vegetation is scanty, trees almost absent, and the population mostly nomadic; except in the lower valleys, where there is an agricultural population, it is very sparse. The climate of central Asia generally presents extremes of heat and cold, and great deficiency of rain. It has accordingly a deficient vegetation and a scanty nomadic population. The great region of Siberia, which, as already mentioned, is a level or slightly undulating plain, lying wholly within the temperate and frigid zones, has a climate which generally resembles that of similar latitudes in Europe, with the exception of greater heat and drought in summer and greater cold in winter. The rainfall is very moderate, but the drainage is deficient and the soil often becomes

ASIA

swampy. The vegetation is scanty, consisting mostly of grasses and shrubs in the plains and pine forests on the mountains. There is very little land under cultivation and the population is very thin. The northern part of China to the east of central Asia has a temperate climate with a warm summer, and in the extreme north a severe winter. It is well watered and wooded, possesses a fertile and well-cultivated soil yielding the usual products of temperate regions, and is thickly peopled. The district lying to the south of the central region, comprising the two Indian peninsulas, southern China, and the adjacent islands, presents the characteristic climate and vegetation of the southern temperate and tropical regions. Here, however, the modifying effects of altitude come most largely into play, and every variety of climate and form of vegetation is to be found on the slopes of the Himalayas, and the mountains and plains of southern India and of the eastern peninsula. The part of Asia south of the Himalayas, though not all lying within the tropics, is all subject to tropical influences. Among the principal of these may be reckoned the effects of the tropical heat upon the air-currents. To this cause are due the trade-winds, which, carrying the moisture of the southern seas to the continents to be condensed by the mountain masses against which they strike, by determining the rainfall of the various continental districts, and affecting the size and course of the rivers, produce so many climatic effects. More local in their effects as well as arbitrary in their occurrence, and consequently fatal in their violence, are the cyclones, or circular storms, common in the Bay of Bengal and the China Sea. The normal directions of the monsoons are northeast and southwest; the northeast monsoon begins in April and the southwest in October; but the direction, duration, and intensity of these winds are greatly modified, especially on land, by local circumstances. The soil of the southern regions is usually good, and where moisture is sufficient vegetation is rich and even exuberant. The soil of India is so finely comminuted that it has been said it is possible to go from the Bay of Bengal to the Indus and return again to the sea without finding a single pebble. The rainfall in those regions is extremely irregular. There are belts where hardly any rain falls at all, others of moderate, and others of very heavy rainfall. On the Khasia Hills, to the northeast of the delta of the Ganges and Brahmaputra, the heaviest rainfall in the world takes place, the average fall observed being 550 inches a year. The principal period of rain is during the southwest monsoon. On the mountains which directly face the winds, charged with vapor as they come from the sea, the rain will fall in abundance, while they pass over intermediate plains without parting with their moisture. The rainfall, the course of the rivers, and the irrigation and fertility of the plains of India is accordingly determined by the position of the Himalayas, the Ghats, and other mountain ranges. The high plateau which extends from Asia Minor to the Indus has a temperate climate, with some extremity of heat in summer and cold in winter. Rain falls chiefly in winter and spring. The eastern part of this plateau is deficient in rain, and the soil is poor and unproductive, the western portion, consisting of Asia Minor, is more

favorable of nature. The desert character of large parts of Arabia, Persia, and Baluchistan has already been alluded to. Some parts of the coast of Arabia, as Yemen and Oman, are fertile, but the greater part, especially on the Red Sea, is barren and desolate. A desert belt surrounds an interior plateau of 1,000 to 3,000 feet in height, and of moderate fertility. Syria is divided between hilly and fertile and low desert tracts. The Japanese Islands, which are traversed by mountains of considerable elevation, and extend over about 15° of latitude, experience a great variety of climates. In the north the climate is rigorous, owing to the Siberian winds; in the south it is mild. The eastern coast is milder than the west, being sheltered by the mountain ranges from the cold winds of the continent. The country generally is fertile and populous. The character and productions of the other islands are mostly tropical.

A greater extreme of cold is reached in North America than in northern Asia, the mean temperature of the east coast of Siberia being above the zero of Fahrenheit; and the heat of southern Asia is less than that of Africa, which has more land lying within the tropics. In Siberia the extremes of temperature are great, exceeding 100° between the mean of the hottest and coldest month on the coast, and being commonly over 60° throughout the country. As the equator is approached the extremes of temperature diminish till at the southern extremity of the continent they approach within 5°. The highest temperature attained in southern Asia is about 112°, the highest mean about 82°. The summers of the northern latitudes, though shorter, attain a maximum of heat not much short of the tropics, the greater length of the day compensating for the less intensity of the mid-day heat. On the Persian plateau the summer heat is increased by the want of rain, and the severity of the winter by the elevation.

Vegetation.—The plants and animals of northern Asia generally resemble those of similar latitudes in Europe, though the extremes of climate are greater. The plateau extending from Asia Minor to the Himalayas resembles southern Europe in its productions, and the desert belt of Asia has an affinity to the African desert. The characteristic types of Siberia are continued to the high regions of central Asia. The community of type with European forms also extends to North China, where is developed besides a relation with the types of North America. The whole of northern Asia differs from Europe more in species than in genera of vegetable productions. Oaks and heaths are absent in Siberia. The principal mountain trees are the pine, larch, and birch; the willow, alder, and poplar are found in lower grounds. The cultivated plants of Asia Minor and Persia resemble those of southern Europe. In the central region European species reach as far as the western and central Himalayas, but are rare in the eastern. They are here met by Chinese and Japanese forms. The lower slopes of the Himalayas are clothed almost exclusively with tropical forms; higher up, between 4,000 and 10,000 feet, is the region of forests and cultivation, producing all the types of trees and plants that belong to the temperate zone, and having extensive forests of conifers; in the east forest trees are met with at a height of 13,000 feet.

ASIA

Rhododendrons extend to 14,000 feet, and phanerogamous plants are found at the height of 19,500 feet. The southeastern region, including India, the Eastern Peninsula, and China, with the islands, contains a vast variety of indigenous species, varying with the humidity of the climate and the elevation, the forms of higher latitudes being represented on the mountains. In this region we find growing wild a number of plants that have become of the utmost importance to man, such as the sugar-cane, rice, cotton and indigo, pepper, cinnamon, cassia, clove, nutmeg, and cardamoms, banana, cocoanut, areca and sago palms; the mango and many other fruits, with plants producing a vast number of drugs, caoutchouc and gutta-percha. The forests of India contain the oak, teak, sal, deodar, and other timber woods, besides bamboos, palms, sandal-wood, laurels, fig-trees, etc. The Malay Peninsula contains dense forests of similar kinds. The cultivated plants of India include wheat, barley, rice, maize, millet, sorghum, tea, indigo, jute, opium, etc. North of the tropic wheat is sown in November, and reaped early in April, and a crop of rice or other tropical cereal is sown in June and July, and reaped in September and October. Wheat and barley do not grow in southern India, the winter not being sufficiently severe to prepare the ground for them. Cotton, indigo, sugar, tea, tobacco, coffee, pepper, plantains, mangoes, etc., are cultivated in China. Of the Chinese flora the larger portion resemble the Indian, while many are local. In North China, the country between it and the Amur (Manchuria), and the Japanese Islands, large numbers of deciduous trees occur, such as oaks, maples, limes, walnuts, poplars, and willows, the genera being European but the individual species Asiatic. Among cultivated plants are wheat, and in favorable situations rice, cotton, the vine, etc. Japan and the northern parts of this region are rich in species of the pine tribe. According to elevation the islands of the Asiatic Archipelago display an equal diversity with the mainland, the more tropical types being represented on the lower elevations, the more northern on the higher. Coffee, rice, maize, etc., are extensively grown in some of the islands. A line of demarkation called Wallace's line has been drawn at the Strait of Macassar, at which the flora and fauna of Australia begin to appear, and gradually become more pronounced as the distance from Asia and the proximity to Australia increases. The variety of plants of the desert region of Arabia, Persia, and Baluchistan is comparatively small. The predominance of a few species gives character to the whole region. Vegetation is most abundant in spring, when herbaceous and bulbous plants, which extend through this region from Syria to the Himalayas, are abundant. In Arabia Felix, and the warmer valleys of Persia, Afghanistan, and Baluchistan, where the hills are high enough to afford a sufficient rainfall, aromatic shrubs are abundant. Wheat, barley, cotton, and indigo are cultivated in Arabia, and the date-palm flourishes in the desert. On the mountain slopes of western Arabia (Arabia Felix) the coffee-plant, which has probably been derived from Africa, is cultivated. Gum-producing acacias are, with the date-palm, the commonest trees in Arabia; the latter also extends through Persia, and even reaches the shore of the Caspian.

Fleshy plants are characteristic of the most arid portions. In the higher parts of Persia and Afghanistan numerous forms of *Umbelliferae* of great size, as well as thistles and the borage tribe, are abundant. African forms are found not only extending from the African desert along the desert region of Asia, but from south Africa to Ceylon. The Caspian lowlands is the tract where the saline vegetation that is spread over the whole region of steppes and deserts has its greatest development. This region is regarded as the native country of the melon.

Zoology.—There is a still closer resemblance in the fauna than in the flora of northern Asia to that of Europe. Asia south to the Himalayas, together with Europe and North Africa, forms a continuous region, which Dr. Sclater has designated as the Palearctic; southeastern Asia, with Sumatra, Java, Borneo, and the Philippines, he calls the Indian region; Africa south of the Atlas, with Arabia, Palestine, South Persia, the dry part of Baluchistan and Sind, form the Ethiopian region; Celebes and the other islands beyond Wallace's line, with Australasia, the Australian region. Nearly all the mammals of Europe occur in northern Asia, with numerous additions to the species. *Quadruman*a are rare, *Carnivora* numerous, especially bears, wolves, and weasels. Moles, shrews, and hedgehogs are common among *Insectivora*. Rodents are represented by marmots and the pika or tailless hare. There are numerous species of wild sheep, antelopes, and deer. Of the last the musk-deer and sambar are characteristic. The ornithology of Europe and northern Asia are identified to a still greater extent. A large majority of European species extend over northern Asia as far as Japan. The pheasant family in the wild state is peculiar to central Asia, the golden pheasant and several other species belonging to the northeast. The genera and species of passerine birds is very numerous. In the Indian region there are several peculiar species of the *Quadruman*a or monkey tribe. Among the distinctive forms of this region is the elephant, the Asiatic species being distinct from the African. The lion (now almost extinct), tiger, leopard, cheetah, jungle-cat, ounce, bears, civets, ichneumons, and other carnivorous animals are found. The lion inhabits Arabia, Persia, Asia Minor, Baluchistan, etc., and extends as far east as India, being now, however, confined to Guzerat. The tiger is the most characteristic of the larger Asiatic *Carnivora*. It extends from Armenia across the entire continent, being absent, however, from the greater portion of Siberia and from the table-land of Tibet; it extends also into Sumatra, Java, and Bali. The horse, ass, and camel have their true home in Asia. In the Indian region we also find the rhinoceros, buffalo, ox, deer, squirrels, porcupines, as well as various species of *Edentata*. In birds nearly every order except ostriches is represented. Among the most interesting forms are the hornbills, the peacock, the Impey pheasant, the tragopans, and other gallinaceous birds, the pheasant family being very characteristic of the region. The desert region, extending from Arabia to Sind, is chiefly distinguished by the absence of many Indian forms and the presence of some African ones, which, however, are not widely spread, most of them being limited to Arabia and Syria. In

ASIA

the Malay Archipelago marsupial animals first occur in the Moluccas and Celebes, while various mammals common in the western part of the archipelago are absent. A similar transition toward the Australian type takes place in the species of birds. Of marine mammals the dugong is peculiar to the Indian Ocean; in the Ganges is found a peculiar species of dolphin. The chief haunts of the *Reptilia* of Asia are the northern portion of Hindustan, the south-eastern peninsula, China, and the islands of Ceylon, Sumatra, and Java. At the head of the reptiles stands the Gangetic crocodile, frequenting the Ganges and other large rivers; the helmeted crocodile and the double-crested crocodile are numerous in various quarters, both insular and continental. Among the serpents are the cobra da capello and a species of *Trigonocephalus*, both among the most deadly snakes in existence; there are also large boas and pythons, besides sea and fresh-water snakes. There are also a number of species of frogs and toads and of fresh-water tortoises, as well as chameleons and other lizards. The seas and rivers of Asia produce a great variety of fish. The *Salmonidae* are found in the rivers flowing into the Arctic Ocean, but not in those of southern Asia. Large numbers are caught. Trout are found in the feeders of the Indus and the Caspian. Sturgeons abound in the Black Sea and the Caspian. Two rather remarkable kinds of fishes are the climbing perch and the archer fish. The well-known gold-fish is a native of China.

Asiatic Races.—The Mongolian race is the most numerous in Asia. It occupies the Chinese empire, Tartary, and probably Japan, with part of the Indo-Chinese Peninsula. It is partly settled, as in China, Japan, and the peninsula; partly nomadic, as in Tartary and Mongolia. The Aryan is the next in numbers, and the most civilized of the Asiatic races. It was until the Mohammed conquest the dominant, as it is still the most numerous, race in India. It also prevails in Persia and in the middle region from Afghanistan to Asia Minor. The Semitic race is widely spread in southwestern Asia, and formerly at least extended to Africa. The Dravidian race in South India, the Malays in the eastern peninsula, and other races locally distributed, have no well-defined relation with the larger races. The Dravidians are variously associated with the Mongols and the Australians. The latter theory is connected with the hypothesis of a southern continent, which also connects these races with Africa. See ETHNOLOGY.

Political Divisions.—A large portion of Asia is under the dominion of European powers. Russia possesses the whole of northern Asia (Siberia) and a considerable portion of central Asia, together with a great part of ancient Armenia, on the south of the Caucasus; Turkey holds Asia Minor, Syria, and Palestine, part of Arabia, Mesopotamia, etc.; Great Britain rules over India, Ceylon, a part of the Indo-Chinese Peninsula (Upper and Lower Burma), and one or two other possessions; France has acquired a considerable portion of the Indo-Chinese Peninsula (Cochin-China, Anam, Tonkin, Cambodia), and has one or two small settlements besides, while to Holland belong Java, Sumatra, and other islands or parts of islands in the Asiatic or Malay Archipelago. The

chief independent states are the Chinese empire, much the most populous of all; Japan, Korea, Siam, Afghanistan, Persia, and the Arabian states. The total population of the continent is estimated at 905,000,000.

Religions.—Asia has been the birthplace of religions; the Jewish, Buddhist, Christian, and Mohammedan having their origin in Asia, where they grew up under the influence of still older religions, the Babylonian and that of Zoroaster, both also of Asiatic origin. At present the inhabitants of Asia belong chiefly to the Buddhist religion, which has 530,000,000 to 560,000,000 of followers, that is, nearly one third of mankind. The old faith of Hinduism has 187,000,000 of followers in India. Most of the inhabitants of western Asia, as also of part of central Asia, follow the religion of Islam; they may number about 90,000,000. The Christians number about 20,000,000 in Armenia, Caucasus, Siberia, and Turkestan. Jews are scattered mostly in western and central Asia. A few fire-worshippers, Guebbers or Parsi of India and Persia, are the sole remnant of the religion of Zoroaster; while vestiges of Sabaism are found amidst the Gesides and Sabians on the Tigris.

Civilization.—There are to be found in Asia all varieties of civilization, the primitive tribes of northeastern Siberia, the confederations of nomadic shepherds, and great nations in possession of a common stock of national customs, beliefs, and literature, like China; the tribal stage; the compound family, forming the real basis of China's social organization; the rural community, both of the Indian and Mussulman type; the loose aggregations of Tchuktchis, having no rulers and no religion beyond the worship of forces of nature, but professing with regard to one another principles of morality and mutual support often forgotten in higher stages of civilization; and despotic monarchies with a powerful clergy. So also in economic life. While the tribes of the northeast find their means of subsistence exclusively in fishing and hunting, carried on with the simplest implements, among which stone weapons have not yet quite disappeared, and the tribes of central Asia carry on primitive cattle-breeding and lead a half-nomadic life, others are agriculturists, and have brought irrigation (in Turkestan) to a degree of perfection hardly known in Europe.

Internal Communication.—Caravans of camels are the chief means of transport for goods and travelers in the interior; donkeys, yaks, and even goats and sheep are employed in crossing the high passages of the Himalayas; horses are the usual means of transport in most parts of China and Siberia, and in the barren tracts of the north the reindeer and, still farther north, the dog, are made use of. Fortunately the great rivers of Asia provide water communication over immense distances. The deep and broad streams of China, allowing heavy boats to penetrate far into the interior of the country, connect it with the sea; a brisk traffic is carried on along these arteries. In Siberia the bifurcated rivers supply a waterway, not only north and south along the course of the chief rivers running toward the Arctic Ocean, but also west and east; thus a great line of water communication crosses Siberia, and is, with but a few interruptions, continued in the east by the Amur, navigable for more

than 2,000 miles. In the winter the rivers and plains of Siberia become excellent roads for sledges, on which goods are still chiefly transported.

Railways.—In 1900 the lines in existence had a total length of about 30,000 miles, of which two thirds belonged to British India. The portions of the trans-Caspian and trans-Siberian railways already constructed had a length of 3,200 miles. A number of European syndicates held concessions for 3,600 miles of railroads in China, which will traverse regions rich in minerals and agriculture; many of these lines were then in process of construction. The Chinese government owned about 300 miles of railway. The lines are very remunerative, especially that from Peking to Tien-Tsin. Japan is well provided with railroads; the length being 3,200 miles. French Indo-China had only 120 miles, but the French possessions in Cochinchina, Anam, and Tonkin are expected soon to have 2,400 miles, which will greatly help to develop their mineral and agricultural resources. The Dutch Indies are well supplied. Java alone has 1,000 miles. There are as yet no railroads in Persia of any consequence; but Turkey operates 1,500 miles in Asia, and 600 miles more are in construction or projected.

Telegraph communications are in a much more advanced state than the roads. St. Petersburg is connected by telegraph with the mouth of the Amur and Vladivostok (on the frontier of Korea); while another branch, crossing Turkestan and Mongolia, runs on to Tashkend, Peking, and Shanghai; Constantinople is connected with Bombay, Madras, Singapore, Saigon, Hong-Kong, and Nagasaki in Japan; and Singapore stands in telegraphic communication with Java, and Port Darwin in Australia. Finally, Odessa is connected by wire with Tiflis in Caucasus, Teheran, and Bombay.

Trade.—Notwithstanding the difficulties of communication a brisk trade is carried on between the different parts of Asia, but there is no possibility of arriving at even an approximate estimate of its aggregate value. The maritime exports to Europe, the United States, and overland to Russia, have an annual value of about \$900,000,000, and the imports of about \$750,000,000. Asia deals chiefly in raw materials, gold, silver, petroleum, teak, and a variety of timber-wood, furs, raw cotton, silk, wool, tallow and so on; the products of her tea, coffee, and spice plantations; and a yearly increasing amount of wheat and other grain. Steam industry is only now making its appearance in Asia, and, although but a very few years old, threatens to become a rival to European manufacture. Indian cottons of European patterns and jute-stuffs already compete with the looms of her European sister countries. Several of the petty trades carried on in India, China, Japan, Asia Minor, and some parts of Persia, have been brought to so high a perfection that the silks, printed cottons, carpets, jewelry, and cutlery of particular districts far surpass in their artistic taste many like productions of Europe. The export of these articles is steadily increasing, and Japan supplies Europe with thousands of small articles—applications of Japanese art and taste to objects of European household furniture.

History.—The origin of the name Asia is in-

volved in obscurity, and it is not certainly known whether it arose among the Greeks or was borrowed by them from some Asiatic people. The Greeks seem to have applied it originally only to Lydia, the part of the continent with which they first became acquainted. Modern scholars are inclined to believe that the name Asia is connected with the Sanskrit *ushas*, the dawn, as Europe may be connected with the Hebrew *ereb*, the west or the sun-setting.

The oldest historical documents are of Asiatic origin, and next to the immediately contiguous kingdom of Egypt Asia possesses the oldest historical monuments in the world.

The oldest historical monuments in Asia are those of Assyria (see ASSYRIA), and with them are associated traditions which carry us back to a remote and indefinite antiquity. A similar vague antiquity belongs to the historical traditions of India and China. Criticism, however, reduces all these claims to moderate dimensions, and assigns to the oldest ascertained facts a period not more remote than some 4,000 years from the present.

The earliest facts in the history of Asia, apart from documents and monuments, consist in the migrations of races, the evidence of which is derived from tradition, from language, from customs, and from religion. The earliest known seat of the Aryan race was on the banks of the Oxus. Hence probably from the pressure of the Mongolian tribes to the north they spread themselves to the southeast and southwest, pressing upon the Dravidian inhabitants of India and the Semitic races of southwestern Asia. Finally they drove the Dravidians to the south of India and occupied Persia and other parts of western Asia, spreading into Europe. It is a remarkable circumstance that in this invasion the Aryans appear to have acquired the use of letters from the peoples with whom they came in contact, the Dravidian letters being borrowed in India and the Semitic in Persia as the original basis of the Sanskrit and Zendic alphabets. At a later period the Greeks likewise adopted a Semitic alphabet from the Phœnicians. The Semites have spread within historical times into northern Africa, and their migrations had probably taken a similar course before they were recorded in history. A large portion of the Mongols are still, as they have always been, a nomadic race, and their migrations, carrying everywhere the terror of predatory arms, have spread from the settled part of their own race in China along the north of Asia into northern Europe.

The early religion of the Aryan race,—a nation of shepherds,—divided itself after their separation into two related but widely different developments, Brahmanism and Zoroastrianism. (See INDIA (*Religion*); ZEND-AVESTA.) The former became rich in mythological, theological, and philosophical literature; but historical literature properly so called is wanting, and consequently there is a great absence of certainty with regard to the dates of early events. The war which the Mahābhārata (see SANSKRIT LANGUAGE AND LITERATURE) professes to narrate is believed to be the earliest event in Indian history that can be regarded as historical, and probably took place about 1200–1400 B.C. In China authentic history extends back prob-

ASIATIC ART.

ASIA

ably to about 1100 B.C., with a long preceding period of which the names of dynasties are preserved without chronological arrangement. The kingdoms of Assyria, Babylonia, Media, and Persia, alternately predominated in southwestern Asia. The arms of the Pharaohs also extended into Asia, but their conquests there were short-lived. From Cyrus (B.C. 559), who extended the empire of Persia from the Indus to the Mediterranean, while his son, Cambyses, added Egypt and Libya to it, to the conquest of Alexander (B.C. 330), Persia was the dominant power in Asia. The administration of Persia was not without vigor and policy, yet the Macedonian conquest was an event of great importance to Asia, bringing it, along with northern Africa, into closer relation with the more advanced and progressive continent of Europe. The division of Alexander's empire led to the protracted struggle between the Greek dynasties of Egypt and Syria, which ended in the absorption of both kingdoms in the Roman empire. After the unfortunate issue of the second Punic war Hannibal took refuge with Antiochus the Great of Syria, who, in the course of his conquests, had come in contact with the Romans, and was at length incited to try his strength with them. In the course of the war with Antiochus L. Scipio, together with his brother, the conqueror of Carthage, passed into Asia. The kingdom of Antiochus was spared after his overthrow; but in B.C. 65 Syria became a Roman province. The Roman empire ultimately extended to the Tigris.

The knowledge of Asia possessed by the Greeks and Romans was at its widest extent very limited. The countries with which they were best acquainted were naturally in the west. China they knew as the country of the Seres or Sinæ, and the northern portions of the continent, inhabited by predatory Mongol tribes, were vaguely designated as Scythia. Of India the northwestern and western parts were known, and Ceylon likewise, under the name of Taprobane. The country traversed by the Hindu Kush, and the sources of the Oxus, was known as Bactria; that between the Oxus and the Jaxartes as Sogdiana; a large and vaguely defined central district, including Persia, was known as Ariana. Ptolemy had some acquaintance with the Indian Peninsula, with the table-land of central Asia, with the Himalayas (Imaus) and China. The better known countries of the southwest comprised Asia Minor, Armenia, Arabia, Persia, Media, Parthia, Mesopotamia, Babylonia, Assyria, Syria.

Soon after the most civilized portions of the three continents had been reduced under one empire the great event took place which forms the dividing line of history. Christianity spread rapidly in the Roman empire; but Armenia was the first country which received it as a national religion. In A.D. 226 the Parthian monarchy which had arisen in eastern Persia about B.C. 250, and had disputed the empire of Asia with the Romans, was overthrown by the revived Persian dynasty of the Sassanidæ. The empire of Asia was now disputed with the Romans by the Persians. In the revived Persian empire the Magian religion was restored, and after the establishment of Christianity in the Roman empire religious jealousy embittered the feud between the two powers. The possession of Ar-

menia was the subject of a protracted struggle between them; but its religion inclined it to the Roman alliance. The Tigris formed the most permanent boundary between the two empires, neither being able long to maintain any conquests beyond it. Christianity was persecuted in the Persian empire, and could not extend itself freely beyond the Roman limits. After the division of the Roman empire (A.D. 364) the struggle continued between the eastern and the Persian empires until the rise of a new power destined to absorb them both. While the Eastern empire was struggling more and more feebly with the Persians, the Mongols, and the barbarians of Europe, a new religion arose in Arabia (A.D. 622), which gathered around it a band of enthusiasts, small at first, but inspired with the most ardent zeal of proselytism. The central tenet of the unity of God gave them the sympathy of the Monophysite sect, which, persecuted in the empire, was powerful in Egypt, Syria, Mesopotamia, and Armenia. Arabia, the country of the Prophet, soon gave its adherence to the new faith. The sword was consecrated as the instrument of its propagation. Persia was the first great conquest of the Arabians. Syria and Egypt soon fell before their arms, powerfully aided by the defection of the heretics of the empire, and within 40 years of the celebrated flight of Mohammed from Mecca, which constitutes the era of his followers, the sixth of the Caliphs, or successors of the Prophet, was the most powerful sovereign of Asia. Heraclius, one of the most warlike, and in the early part of his reign one of the most successful of the eastern emperors, had succumbed to this torrent of conquest, and his successors trembled at the names of their rivals. The successors of Mohammed were at first austere and simple in their manners, and narrow and zealous in their religious faith; but from the accession of Moawiyah (A.D. 661), the time when the seat of empire was transferred first to Damascus and subsequently to Bagdad, the throne of the Caliphs was as splendid as it was powerful. The generous blood of Arabia, nourished by more genial climes, showed an aptitude for all that is great, not only in military achievement, but in learning, science, literature, and art. The empire was soon divided, but wherever the Arab sway prevailed a liberal patronage of learning and toleration even of speculative inquiry distinguished it. The career of conquest was not soon ended. It spread with astonishing rapidity over Africa and Europe, and was finally checked only by the fatal divisions which originated in the disputes between the descendants of the Prophet and the dynasty of the Ommyades, descended from his mortal foe and tardy convert, Abu Sophian.

Among the alternate protectors and oppressors of the eastern Roman empire were the various Mongol tribes, whose predatory course led them to the west. In these also the Arab rulers found dangerous converts, who first supplied the place of their own troops, grown effeminate with luxury, and then supplanted themselves in the throne of which they had superseded the natural defenders. While the Caliphs of Bagdad still held a nominal sway, subject to the dictation of their Turkish guards, Mahmud, the Mongolian Mohammedan ruler of Ghazni, asserted his independence (999), con-

ASIA; ASIA MINOR

quered India, and established the Mogul dynasty. Another revolt from the empire of Mahmud founded the Seljuk dynasty, which established itself in Aleppo, Damascus, Iconium, and Kharism, and which was distinguished for its struggles with the Crusaders. Othman, an amir of the Seljuk sultan of Iconium, established the Ottoman empire in 1300. About 1220 Genghis Khan, an independent Mongol chief, made himself master of central Asia, conquered northern China, overran Turkestan, Afghanistan, and Persia; his successors took Bagdad and extinguished the remains of the Caliphate. In Asia Minor they overthrew the Seljuk dynasty. His grandson, Kublai Khan, conquered China in 1260. The successors of Genghis Khan also invaded Russia, and the Christian empire established by Vladimir was overthrown by the Golden Horde, led by his grandson Batu (1240). Timur or Tamerlane, who professed to be a descendant of Genghis, carried fire and sword over northern India and western Asia, defeated and took prisoner Bajazet, the descendant of Othman (1402), and received tribute from the Greek emperor. The Ottoman empire soon recovered from this blow, and Constantinople was taken and the Eastern empire overthrown by the Sultan Mohammed II. in 1453. China recovered its independence about 1368 and was again subjected by the Manchu Tartars (1618-45), soon after which it began to extend its empire over central Asia. Siberia was conquered by the Cossacks on behalf of Russia (1580-4). The same country effected a settlement in the Caucasus about 1786, and has since continued to make steady advances into central Asia. The discovery by the Portuguese of the passage to India by the Cape of Good Hope led to their establishment on the coast of the peninsula (1498). They were speedily followed by the Spanish, Dutch, French, and British. The struggle between the two last powers for the supremacy of India was completed by the destruction of the French settlements (1760-65), and from that time the conquest of India by the British progressed with uninterrupted success. In 1858 India came directly under the British crown. The extension of the influence and possessions of European powers, especially Russia, Great Britain, and France, has latterly been a most striking fact in Asiatic history. For particular phases of the modern history of Asia see CHINA; KOREA; JAPAN; MANCHURIA; RUSSIA AND TURKEY. Also BOXERS and TRIPLE ALLIANCE

Asia, Central, a designation loosely applied to Asiatic territory east of the Caspian, also called Turkestan, and formerly Tartary. The eastern portion belongs to China, the western now to Russia. Russian central Asia comprises the Kirghiz Steppe (Uralsk, Turgai, Akmolinsk, Semipalatinsk, etc.), and what is now the government-general of Turkestan, besides the territory of the Turkomans, or Tanscaspia and Merv. The entire area is about 1,350,000 square miles. See Bouvalot, 'Through the Heart of Asia' (1889); Phibbs, 'Central Asia' (1899).

Asia Minor (Asia the Less) is the extreme western peninsular projection of Asia, forming part of Turkey in Asia. The name is not very ancient; originally the Greeks seem by Asia

to have meant only the western part of Asia Minor, but with their geographical knowledge the scope of the name Asia gradually widened. The late Greek name for Asia Minor is Anatolia—*Anatolē*, "the East," whence is formed the Turkish *Anadöli*. Asia Minor includes the peninsula; the eastern boundary, somewhat artificial, being a line from the Gulf of Skanderoon to the upper Euphrates, and thence to a point east of Trebizond. The area of the peninsula exceeds 220,000 square miles. It constitutes the western prolongation of the high table-land of Armenia, with its border mountain ranges. The interior consists of a great plateau, or rather series of plateaus, rising in gradation from 3,500 to 4,000 feet, with bare steppes, salt plains, marshes, and lakes; the structure is volcanic, and there are several conical mountains, one of which, the Ergish-dagh (Argæus), with two craters, attains a height of 11,830 feet, towering above the plain of Kaisarieh, which has itself an elevation of between 2,000 and 3,000 feet. The plateau is bordered on the north by a long train of parallel mountains, 4,000 to 6,000 feet high, and cut up into groups by cross valleys. These mountains sink abruptly down on the northern side to a narrow strip of coast; their slopes toward the interior are gentler and bare of wood. Similar is the character of the border ranges on the south, the ancient Taurus, only that they are more continuous and higher, being, to the north of the Bay of Skanderoon, 10,000 to 12,000 feet, and farther to the west, 8,000 to 9,000 feet. The western border is intersected by numerous valleys opening upon the archipelago, to the northern part of which Mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast-lands of the Levant. Of the rivers the largest is the Kizil Irmak (Halys), which, like the Yeshil Irmak (Iris), and the Sakaria (Sangarius) flows into the Black Sea; the Sarabat (Hermus) and Meinder (Mæander) flow into the Ægean.

The climate has, on the whole, a southern European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer, and a cold one in winter; the southern coast has mild winters and scorching summers; while on the coast of the Ægean there is the mildest of climates and a magnificent vegetation. On the northern side the climate is not so mild, but the vegetation is most luxuriant.

In point of natural history, Asia Minor forms the transition from the continental character of the East to the maritime character of the West. The forest-trees and cultivated plants of Europe are seen mingled with the forms characteristic of Persia and Syria. The central plateau, which is barren, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; while the coasts, rich in all European products, fine fruits, olives, wine, and silk, have quite the character of the south of Europe, which on the warmer and drier southern coast shades into that of Africa.

The inhabitants, some 7,000,000 in number, consist of the most various races. The dominant race are the Osmanli Turks, who number about 1,200,000, and are spread over the whole

country; allied to these are the Turkomans and Yuruks, speaking a dialect of the same language. The latter are found chiefly on the table-land, leading a nomadic life; there are also hordes of nomadic Kurds. Among the mountains east of Trebizond are the robber tribes of the Lazes.

The Greeks and Armenians are the most progressive elements in the population, and have most of the trade. While the Greeks monopolize the professions, the ownership of the land is largely passing into the hands of Greeks, Armenians, and Jews. Administratively the country falls into eight vilayets or governments, with their capitals in Brusa, Smyrna, Konieh (Iconium), Adana, Sivas, Angora, Trebizond, and Kastamuni respectively. In ancient times the divisions were Pontus, Paphlagonia, Bithynia, in the north; Mysia, Lydia, Caria, in the west; Pisidia with Pamphylia, and Cappadocia, in the south; and Galatia with Lycaonia and Phrygia, in the centre. The Turkish islands of the archipelago belong, most of them, to Asia Minor.

Here, especially in Ionia, was the early seat of Grecian civilization, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, etc., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 B.C.) to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates and the Parthians; of the Arabs, Seljuks, Mongols, and Osmanlı Turks with the weak Byzantine empire. Here Alexander the Great and the Romans successfully contended for the mastery of the civilized world. But notwithstanding all these wars the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilization has been sadly brought to ruin. Recently, considerable portions of Armenia have been absorbed by Russia. In 1878 Great Britain made a secret engagement to guarantee against Russian aggression the Asiatic dominions of the Porte.

In Asia Minor an extensive system of railroads has long been under consideration. The first survey for this proposed trunk line was made as far back as 1874, and was from Angora to Bagdad. The financial crisis of 1875 resulted, however, in the abandonment of the scheme, but it was again considered in 1888 by foreigners interested in railroad enterprise in Asia. The Suitari-to-Angora line was conceded in October of that year to the Bank of Berlin, and on 27 Nov. 1892 the first train was run. A branch line was shortly after built between Eski-Schehir and Konia and connected with the line to Smyrna. The success of this undertaking influenced the Sultan's desire to have the line extended to Bagdad across Mesopotamia, and the German syndicate was instructed accordingly. The survey was made in the winter of 1899-1900 by a commission under the presidency of the German consul-general at Constantinople. Matters were hastened by the request of the Emperor William that the work be pushed forward as rapidly as possible.

Asiarch, ä'shî-ärk, a Roman officer appointed as director-general of religious ceremonies in the province of Asia. The expression occurs in the Greek Testament, *Times de kai tôn Asiarchôn*, "And certain also of the Asiarchs" (Acts xix. 31). Properly speaking there was but one Asiarch residing at Ephesus; the others referred to were his subordinates.

A'siat'ic Broth'ers, the designation of a secret society organized in Germany about 1780. See ROSICRUCIANS.

A'siat'ic Societies, learned associations formed for the purpose of collecting and disseminating valuable information respecting the different countries of Asia. The Royal Asiatic Society of Great Britain and Ireland was established 19 March 1823. With it in 1828 was connected a very active translation committee, which publishes English, French, and Latin translations of Oriental works, occasionally accompanied with the originals. Similar societies have been formed in Asia itself, such as the Asiatic Society of Bengal at Calcutta, founded in 1784 by Sir William Jones. Since 1846 the Bibliotheca Indica,—a series of Oriental works in text and translation,—has been published under the supervision of this society at the expense of the Anglo-Indian government. There are similar societies on the Continent and in America, such as the Société Asiatique at Paris, founded in 1822, the Oriental Society of Germany (Deutsche Morgenländische Gesellschaft), founded in 1845, and the American Oriental Society.

Asimina, a-sîm'î-na, or äs'im-î-nä, **Papaw**, a genus of nine species of shrubs or small trees of the natural order *Anonaceæ*, eight of which are natives of eastern North America, the West Indies, and Mexico, with attractive foliage and large purple or whitish axillary flowers appearing in early spring, and large edible berries. Two species are cultivated for ornament and deserve more attention at the hands of horticulturists. One of these, *A. triloba*, which has produced some varieties, is the only arborescent species of the genus. It is hardy as far north as Massachusetts and produces very large seeded fruits, often more than three inches long and too highly aromatic to suit all palates. The other species, *A. grandiflora*, is found in Georgia and Florida, and is said to produce delicious fruits.

A'siphona'ta, an order of lamellibranchiate, bivalve mollusks, destitute of the siphon or tube through which, in the siphonata, the water that enters the gills is passed outward. It includes the oysters, the scallop shells, the pearl oyster, the mussels, and in general the most useful and valuable mollusks.

Ask, in Scandinavian mythology, the name of the first man created. According to the legend, the gods, Odim, Hæner, and Loder, found two trees by the seaside, an ash and an elm. From these they created the first man and first woman, Ask and Embla, and gave them the earth as their dwelling place.

Askew, äs'kü, **Anne**, an English martyr: b. 1521; d. 16 July 1546. She is described as a lady of great beauty and learning, married, much against her inclinations, to Thomas Kyme, who was as attached to the old religion as she was to the new. She was arrested for heresy

ASKHABAD — ASPARAGIN

and led before Bonner, Bishop of London, who induced her to sign a recantation. She was again arrested, however, committed to Newgate, and condemned to death as a heretic. Some days later she was suddenly removed to the Tower, and the rack was applied in the presence, and it is said even by the hands, of Wriothesley, the chancellor, who hoped to extort confession concerning those ladies of the court with whom she corresponded. Before her frame had time to recover from the effects of the rack she was carried in a chair to Smithfield, chained to a stake, and along with four others was burned to death.

Askhabad, äs'kha-bäd', the thriving administrative centre of the Russian province of Transcaspia, situated in the Akhal Tekke oasis, and occupied by Skobeleff in January 1881, after the sack of Geok Tepé. Its distance from Merv is 232 miles, from Herat 388 miles. Pop. (1897) about 20,000.

Askja, ask'ya, a volcano in the centre of Iceland, first brought into notice by an eruption in 1875. Its crater is 17 miles in circumference, surrounded by a mountain-ring from 500 to 1,000 feet high, the height of the mountain itself being between 4,000 and 5,000 feet.

Aslauga's (a-slow'gāz) **Knight**, the title of a romantic tale of mediæval chivalry, by Fredrich, Baron de la Motte, Fouqué. It was published in 1814. The story is told with simplicity and grace, and with it may be compared 'The Fostering of Aslang' in Wm Morris' 'Earthly Paradise.'

Asmai, äs'mī, or **Asmayi**, an Arabic writer, the instructor of Harun-al-Raschid: b. about 740; d. 830. His history of the kings of Arabia and Persia, prior to Islam, is of great value, while his romance of 'Antar' has been called "the Iliad of the desert."

As'manite, a variety of silica, occurring in small grains in certain meteoric irons, and now believed to be identical with tridymite (q.v.).

Asmannshausen, äs'mans-how'zēn, a Prussian village on the Rhine, in the district of Wiesbaden, below Rudesheim, celebrated for its wine, which is produced on a soil formed of blue slate. The red kind, the production of a small red Burgundy vine, is the more valuable, but retains its value only three or four years. After this time it grows worse every year, and precipitates the whole of its red coloring-matter. It is distinguished by color and taste from all other Rhenish wines.

As'mode'us, or **Asmo'dai**, in Hebrew mythology, an evil spirit which slew seven husbands of Sara, daughter of Raguel, at Rages. By the direction of the angel Raphael the young Tobias exorcised Asmodeus with the smell of a fish's liver burned on the coals, into the uttermost parts of Egypt, where the angel bound him.

As'mode'us, **The Lame Devil** ('Le Diable Boiteux'). A novel by Alain René Le Sage, first published in 1707, and re-published by the author, with many changes and additions, in 1725. It is sometimes known in English as 'Asmodeus,' and sometimes as 'The Devil on Two Sticks,' under which title the first English translation appeared, and was dramatized by Henry Fielding in 1768.

As'monæ'ans, a family of high-priests and princes who ruled over the Jews for about 130 years, from 153 B. C. See MACCABEES.

Asmus, äs'mus, **Georg**, a German-American poet: b. Giessen, 27 Nov. 1830; d. Bonn, 31 May 1892. He came to the United States to conduct some mining operations in the copper region of Lake Superior; then lived in New York until 1884, when he returned to Europe. Among the German population of the United States he had an enormous success with his 'American Sketch-Booklet' (1875), an epistle in verse, written in Upper Hessian dialect and overflowing with delicious humor. It was followed by 'New American Sketch-Booklet' (1876). He also wrote 'Camp Paradise' (1877), a story, and a collection of miscellaneous poems (1891).

Asnieres, as-nyār, a northern suburb of Paris, a favorite boating resort with the Parisians. Pop. (1897) 24,317.

Asnyk, äs'nek, **Adam**, a Polish patriot and poet: b. Kalisz, 11 Sept. 1838; d. Cracow, 2 Aug. 1897. He participated in the insurrection of 1863, for which he had to spend some years in exile in Germany. He was author of 'Poezye,' (1872-80), and several successful dramas.

Asoka, a-sō'ka, an Indian sovereign, who reigned 255-223 B. C. over the whole of northern Hindustan. He embraced Buddhism, and forced his subjects also to become converts. Many temples and topes still remaining are attributed to him.

Aso'ka (*Jonesia asoca*), an Indian tree, of the natural order *Leguminosæ*, sub-order *Casalpineæ*, with a flower, showing orange, scarlet, and bright-yellow tints. It is sacred to the god Siva, and often mentioned in Indian literature.

As'olan'do: Facts and Fancies, the latest volume of poems written by Robert Browning and published on the day of his death, 12 Dec. 1889.

Aso'pus, the name of several rivers in Greece. The most celebrated of this name are those in Achaia and Bœotia.

Asp, a venomous snake. The name as applied in the Bible probably refers to the hooded, or African cobra (*Naja haje*), common in Egypt, and often represented in hieroglyphics. The *naja haje* is from three to five feet long, and the loose skin on its neck can be dilated into a hood, like that of the Indian cobra, but its markings differ. (See COBRA.) The asp employed for suicide by Cleopatra was probably the small-horned viper (*Aspis hasselquistii*). The asp of southern Europe is *Vipera aspis*, found from France to the Tyrol and in Italy. (See VIPER.)

Asparagin, **Asparagine**, a nitrogenous substance having the formula $C_4H_8N_2O_8$, or $CONH_2 \cdot CH_2 \cdot CH(NH_2) \cdot COOH$, occurring in the juice of most plants, and notably in the growing buds of asparagus. It is readily obtained by filtering the plant juice, and evaporating it to a syrupy consistency. The asparagin then separates in the form of trimetric prismatic crystals, which are soluble in water and in acids and alkalis, but insoluble in alcohol or ether. Asparagin undoubtedly plays a very important (though yet

ASPARAGUS

unknown) part in the chemistry of plants, since it occurs in large amounts in germinating seeds, and wherever growth is actively proceeding.

Aspar'agus, a genus of about 150 species of mostly tuberous-rooted, climbing, drooping, trailing, or erect perennial herbs or shrubs widely distributed in tropical and warm temperate countries, especially in southern Europe and southern Africa, but more or less cultivated for food or ornament in all civilized countries. Some species rival and even excel the most delicate ferns in beauty of habit and foliage, which botanically considered, consists not of leaves but leaf-like stems. The ornamental species with the exception of *A. verticellatus* (see below), must all be grown in green-houses, except in southern Florida and southern California, where they may be planted with safety out of doors. They are readily and usually propagated by seeds, but often also by cuttings and by division. Among the best-known ornamental species cultivated in America are the following: *A. medeoloides*, also known as *Myrsiphyllum asparagoides*, the smilax of the florist, is widely grown for decorative purposes, for which its glossy green leaves specially commend it. (For culture, see SMILAX.) *A. sprengeri*, a species recently introduced from Natal, with long drooping branches, glossy light-green leaves (white in one variety); small white fragrant flowers in small racemes and little red berries. It is very popular, especially for planting in hanging baskets. *A. plumosus*, a tall climbing species from South Africa with horizontal branches of beautiful form, texture and color, which qualities are retained for weeks or even months after cutting. Deservedly one of the most popular of decorative plants. It has developed several varieties, some of which, especially the variety *tenuissimus*, are even more popular than the original species. *A. verticellatus*, a hardy species with tufts of hair-like leaves and small red berries, is a native of Persia and Siberia, and climbs to a height of 12 to 15 feet from a woody root stock. The stout young shoots are said to be edible, but they quickly become woody and spiny, and are then unfit for the table. Several other species are cultivated for ornament in America.

Best and most widely known, however, is *A. officinalis*, esculent asparagus, which is also used to some extent as an ornamental plant. It is a perennial herb, native of Europe and Asia, and commonly found growing in sandy loam or sea shores, river banks, and among shrubby undergrowth. In a wild state it rarely exceeds a foot in height and a stem diameter of more than one third of an inch; but in gardens sprouts are sometimes obtained as thick as a man's wrist, and the plants often grow more than four feet tall. For more than 2,000 years it has been cultivated for its succulent young shoots, produced from the thick root stocks in spring. An excellent method of growing the plant may be epitomized as follows:

The land chosen for the bed should be a rich, friable and warm loam, preferably exposed to the south or east. Manure should be applied without stint before the plants are set, and the preparation of the soil should be deep and thorough. The plants may be home-grown or purchased. One-year-old plants, if sturdy, are

preferable to older ones. For home growing a separate nursery bed should be prepared, and the seed previously soaked 24 hours in order to hasten germination, when sown in early spring, about two inches apart and one inch deep, at which rate an ounce should be enough for 200 or more feet of drill. Some radish seed of a small early maturing variety should be sown in the same drill, so that the young radish plants, which quickly appear, may mark the position of the rows of the slower-appearing and less-conspicuous asparagus plants. As soon as the radishes are of edible size, or even before, if necessary, they should be pulled and the asparagus plants, then an inch or two tall, left in possession of the ground. Beyond keeping down weeds, destroying pests, and thinning the plants to four inches asunder, no further attention is necessary during the first year. In the spring of the second year, if properly managed during the first, the plants should be large enough to be transplanted to the permanent bed. If too small they should be transplanted at least eight inches asunder, and grown a second year in a nursery bed. In the permanent bed the plants should stand at least two feet asunder in rows not less than four feet apart. Five or even six feet for the larger growing varieties is much better. Staminate plants are more productive of shoots than pistillate, but are difficult to recognize until the plants flower. The furrows are plowed six inches deep or deeper, the plants set in the bottom, but at first covered with only about two inches of earth. After growth starts the trench is gradually filled by cultivation which must be thorough, both among the plants and between the rows. Not before the second spring after planting in permanent quarters should any shoots be gathered. At the time of planting a liberal dressing of some slowly decomposing fertilizer, such as ground bone, should be given in the drill, and in the spring of each year complete fertilizers should be applied liberally. (See FERTILIZERS.) In addition to such applications many growers spread stable manure upon the bed in the autumn after the tops have been removed, a necessary practice to prevent the scattering of the seeds upon the bed. In the spring as soon as the soil can be worked the land is either plowed shallow or cultivated deeply to bury the manure. Since the plants are gross feeders there need be little fear of fertilizing too heavily. Methods of gathering depend somewhat upon whether the stalks are to be blanched or left green. Blanching is done by ridging the soil 13 inches deep above the crowns. Stalks so produced are gathered as soon as the tips appear above the soil; green stalks are cut when about nine inches long, including the base of two or more inches below the surface of the ground. In each case the stalk may be cut with an asparagus knife or preferably snapped near the crown, or at least at the proper depth, if blanched, by plunging the hand down in the loose soil beside the stalk and severing it with the fingers. By the latter method there is less danger of injuring other shoots. All cutting should cease when green peas, grown in the same locality, are ready for the table, because the plants must be given opportunity to store up food for the following year. The stems are usually sold in bunches of various sizes, the grade depending upon the length and

ASPARAGUS-STONE; ASPASIA

number of stalks in the bunch. The bunch commonly sold is eight and one half inches long, weighs about two pounds, and contains 30 spears. As a rule, the thicker the spear the better. First class spears are three quarters of an inch thick or thicker. Every care must be taken in handling to prevent bruising, since a gummy juice collects in the broken cells, and the injured stalks spoil by heating. After washing, the stalks should be dried and kept cool. If to be shipped long distances, their butts should rest in damp sphagnum moss or similar material. In the home garden, where horse cultivation is not practicable, the plants may be set even as close as 18 inches by two feet, but the manuring, cultivation and other care must be increased in order to obtain choice shoots. Each spring the very liberal dressing of manure applied the previous autumn should be forked, not dug, in, and a lavish amount of commercial fertilizer, rich in potash, phosphoric acid, and nitrogen, applied. Soap suds may be emptied upon the bed; they have more or less potash in them. Asparagus sometimes is forced in hot beds, under greenhouse benches, in cellars, etc., by setting mature crowns (plants) close together and supplying heat and moisture. A large amount of light is not essential. It is also forced in the field by covering the beds with cloth and applying heat by means of portable steam pipes, either in or upon the ground. In the former case the roots are ruined by the process; in the latter, they are not, but should be given one or more years to fully recuperate. (See reports and bulletins of Cornell Experiment Station and of Missouri Experiment Station). Several other species furnish edible shoots; for example, *A. acutifolius*, *A. albus* and *A. tennuifolius*, all European species. The tubers of *A. lucidus* are eaten in China and Japan, where the species is indigenous. The shoots of *A. scaber*, which resemble those of *A. officinalis*, are inedible because bitter.

Enemies.—Asparagus has only two important enemies, and when compared with other general crops, long cultivated, only a few less serious ones. Asparagus rust (*Puccinia asparagi*) has been known for about 100 years, but only during the last decade of the 19th century did it do serious damage. In a badly infested field the plants as a whole seem to be maturing very early, their deep green having been replaced by a tawny brown. The stems examined closely, show a blistered and ruptured skin, beneath which are brown masses of spores or in late autumn, almost black winter spores. In the spring the "cluster cup" is the form observed. The most effective control is the resin-Bordeaux mixture, made by adding to each 48 gallons of standard Bordeaux mixture two gallons of resin stock solution, made as follows: Heat five pounds of resin and one pint of fish-oil in a kettle until the resin is dissolved. If very hot, allow to cool somewhat. Then slowly stir in one pound of potash lye and heat again till the mixture becomes the color of amber, when five gallons of water must be added. If the potash be added while the resin is too hot, the mixture may ignite. This solution increases the adhesiveness of Bordeaux mixture. (See FUNGICIDE.) With the mixture 50 per cent greater yield has been obtained in unfavorable seasons, and 70 per cent in favorable. Growers

cutting 800 bunches or more per acre find that thorough spraying each week for four, five or even more weeks pays well. For detailed account of this disease and specific methods of control, see New York Experiment Station Report (1901). The asparagus beetle (*Crioceris asparagi*), a European insect introduced about 1856, the only seriously injurious insect pest, is about one quarter of an inch long with black and yellow or red wing-covers. It belongs to the *Chrysomelida*. It appears as the adult in spring, and lays eggs on the shoots. In a few days grayish-green grubs appear and gnaw the green parts of the plants. When full grown they burrow in the ground to pupate for a short time. The broods succeed each other at intervals of about a month, if the weather be favorable. Their natural enemies are lady-bird beetles and soldier beetles. The popular remedies are the corralling of chickens, ducks, and turkeys in the plantation; cutting all volunteer plants in waste places; cutting new shoots daily; allowing spindling shoots to remain in alternate rows for the insects to deposit their eggs upon and burning the shoots not less often than once a week; dusting with air-slaked lime or road dust while the dew is on; brushing the grubs to the hot ground from the full grown plants, the middle of the day being chosen for this operation; spraying with arsenites, hellebore or other stomach poisons; etc. A case of fight early and fight late! The 12-spotted asparagus beetle (*Crioceris 12-punctatus*), about the same size as its relative just described, but orange red with black dots, has a similar life history, and may be controlled in the same way but is not yet seriously troublesome, except in a few localities. Several plant bugs, moth larvæ, beetles and aphids also feed upon asparagus, but have not become serious pests. Consult: Year-book United States Department of Agriculture (Washington, 1896), and Bulletin No. 10 (1898). See INSECTICIDES.

For fuller details of asparagus culture consult: Hexamer, 'Asparagus Culture' (1901); Bailey and Miller, 'Cyclopedia of American Horticulture' (1900-02). In the latter will also be found specific instruction for the cultivation of ornamental asparagus.

Asparagus-stone, a variety of apatite, found in Murcia, Spain, in the form of small, transparent, yellowish-green crystals.

Aspasia, às-pā'shī-a, a celebrated woman of ancient Greece: b. in Miletus in Ionia, but spending a great part of her life in Athens. Her house was the general resort of the most virtuous, learned, and distinguished men in Greece. She inspired the strongest and most enduring affection in the heart of Pericles, who had separated from his own wife and united himself to Aspasia as closely as was permitted by the Athenian law, which declared marriage with a foreign woman illegal. When the Athenians were dissatisfied with Pericles, instead of attacking him they persecuted the objects of his particular favor, and accused Aspasia of contempt of the gods. Pericles defended her in the Areopagus, but it required all his influence to procure her acquittal. After his death (B.C. 429) Aspasia is said to have attached herself to a wealthy but obscure cattle-dealer, of the name of Lysicles, whom she soon made, however, an influential

ASPECT — ASPHALT

citizen in Athens. She had a son by Pericles, who was legitimated by a special decree of the people.

Aspect, a term in astronomy and astrology, denoting the situation of the planets and stars with respect to each other. There are five different aspects: (1) sextile aspect, when the planets or stars are 60° distant, and marked thus, *; (2) the quartile or quadrature, when they are 90° distant, marked \square ; (3) trine, when 120° distant, marked \triangle ; (4) opposition, when 180° distant, marked \oslash ; and (5) conjunction, when both are in the same degree, marked \odot . Kepler added eight more. It is to be observed that these aspects, being first introduced by astrologers, were distinguished into *benign*, *malignant*, and *indifferent*; and Kepler's definition of aspect, in consequence, is "Aspect is the angle formed by the rays of two stars meeting on the earth, whereby their good or bad influence is measured." The only aspects now in use are conjunction and opposition.

Aspen, Col., a city and county-seat of Pitkin County, on the Roaring Fork of Grand River, and the Atchison, T. & S. F., and the Denver & R. G. R.R.'s; 30 miles west of Leadville. It was incorporated in 1883; and has since become the centre of one of the richest mining sections in the country. In the city and vicinity are more than 20 mines, for which there are a number of gold, silver, copper, and lead ore mills. While the smelting and concentrating of ores is the distinctive industry, the city has several minor factories, and it is also the principal mining trade centre of the Roaring Fork valley. Pop. (1900) 3,303.

Aspen, tremulous poplar, an open-headed tree, of the natural order *Salicaceæ*, native of the cooler parts of Europe and Asia, and succeeding best upon moist, gravelly soils. It grows quickly; usually attains a height of 50 to 60 feet, sometimes even 100 feet; has light, small, thin-toothed leaf-blades upon long, slender, flattened petioles which permit the blade to flutter with the least breeze, hence the specific name *tremula*, tremulous. The wood being white, light, soft, and porous, is not a valuable fuel, but is useful for making charcoal for the manufacture of gunpowder, and for turning, often being employed for making bowls, trays, troughs, and pails. The wood may be made harder and thus rendered useful for interior work in houses by peeling off the bark and allowing the stem to dry before felling it. In places where this tree abounds, and other timber is scarce or expensive, this method of hardening is very useful. The bark is rich in a glucoside called salicin and used in leather tanning. In the United States the tree is best known as an ornamental one, its variety, *pendula*, with graceful drooping sprays, being perhaps the best weeping poplar. The male plants are preferred because of the abundance of their catkins which appear in early spring before the catkins of American species blossom. The American aspen (*Populus tremuloides*), very generally distributed from Alaska to Labrador and southward to Pennsylvania and California, and, in the mountains to Mexico, so closely resembles the preceding species that many botanists consider it merely a variety. Its light-gray

branches render it conspicuous in clearings where it is one of the first trees to appear. It is said to attain a height of 100 feet when grown in the forest. This tree, like the following, is widely used in the manufacture of wood pulp. The large-toothed aspen (*Populus grandidentata*) is a large American species found from Nova Scotia to Minnesota and southward to Tennessee. It is a tall tree, often reaching 75 feet, and has bluish or rusty-white leaves thicker and larger and with more spreading teeth than the former two species. Except its drooping varieties, it is rarely used as an ornamental tree. See POPLAR.

Aspern, as-pern, and **Esslingen**, two villages a few miles east of Vienna, on the opposite bank of the Danube, celebrated for the battle fought 21 and 22 May 1809, between the Archduke Charles and Napoleon I. After the fall of the capital the Austrian general resolved to suffer a part of the enemy's forces to pass the Danube, and then to surround them with his own army and drive them if possible into the river. Everything depended on the possession of these two villages: Aspern was at first taken by the Austrians, again lost and retaken, till they at length remained masters of it: from Esslingen they were continually repulsed. The battle was renewed on the 22d; the French army being now increased so as at least to equal the Austrians in number. Thousands of lives were sacrificed in vain attempts to capture the villages. Aspern continued to be the stronghold of the Austrians and Esslingen of the French. When the army of Napoleon gave up all hopes of gaining the victory by forcing the centre of the Austrians, Esslingen served to secure their retreat to the island of Lobau. The loss of the Austrians in killed, wounded, etc., was estimated at less than a third of the whole army; that of the French at half. The latter lost on this occasion Marshal Lannes. The Austrians had 4,000 men killed and 16,000 wounded, the French 8,000, 30,000 wounded. By the French the engagement is known as the battle of Essling or Esslingen, but the Austrians style it the battle of Aspern.

Asphalt. The general term asphalt is applied to the several varieties of hydrocarbons of an asphaltic base which exist in all conditions from the liquid to the solid state. It is more specifically employed to include the purer forms of hard and soft bitumen, such as elaterite, albertite, gilsonite, nigrite, wurtzilite, brea, etc. The term bituminous rock includes sandstones and limestones impregnated with bitumen or asphalt. This rock, usually shipped without previous refining, is used principally for street pavements and is mixed with other ingredients at the place of use.

The importation of asphalt into the United States is chiefly from the Island of Trinidad, off the coast of Venezuela. Other imports are made from Bermudez and Venezuela. Bituminous limestones are imported from Neuchâtel and Val de Travers, in Switzerland, from Seyssel in France, and in small quantities from Germany, Italy, Russia, Austria-Hungary, Spain, Turkey in Asia, Great Britain, the United States of Colombia, Canada, the Netherlands, Cuba, and Mexico. The total imports from Trinidad and Venezuela in 1900 amounted to 134,189 long tons, and at the present time the value of our

ASPHALT

domestic product is about equal to that of the imported asphalt, at the point of shipment. The Island of Trinidad, one of the British West Indian possessions, is, next to France, the largest producer of asphalt in the world. The deposits are operated by an American corporation under a concession from the British government, and, also, independently, from land not belonging to the crown, acquired by purchase. The chief source of supply is a lake of pitch filling the crater of an extinct volcano. This lake lies 138 feet above sea-level, and has an area of about 114 acres. The supply is partly renewed by a constant flow of soft pitch into the centre of the lake from subterranean sources. The shipments of this lake pitch average over 80,000 tons per year, and the flow into the lake is at the rate of about 20,000 tons per year. The depth of this lake is about 135 feet at the centre. Distinct from the lake pitch is what is known as "land pitch," the overflow in past times of pitch from the lake, and deposits of similar nature. During recent years strenuous efforts have been made to discredit all asphalt mined from properties located outside of Pitch Lake. These efforts seem to have failed, however. Careful analyses of samples of asphalt taken from different parts of Pitch Lake, from deposits outside the lake and from the district of La Brea show that these asphalts are so similar in composition that for practical purposes they may be considered as identical in quality. The samples have a common origin, for the presence of mineral matter in these asphalts cannot be regarded as adventitious, since it is thoroughly incorporated with the bitumen in the same proportion and has the same percentage of composition, as regards the relative proportions of matter soluble in water, in acids and insoluble substances. There is no doubt that the pitch found in the deposits outside the lake has been divided from the lake itself by the subterranean flow of pitch to the viscous condition, a condition rarely assumed under the combined influence of heat and pressure. It is true there is a difference in the crude materials in these asphalts; one is softer than the other, because of containing more volatile oils. Nature simply began on the asphalt outside the lake; it being more exposed to the rays of the tropical sun, the process of refining it drove those volatile oils off, a necessary accomplishment to make the material fit for paving purposes. It would appear, therefore, that a part of the labor of refining has been done on the land or overflow asphalt which remains to be done with the lake asphalt.

In 1875 the asphalt paving industry was in its infancy in the United States. In 1903 there were about 42,000,000 square yards of asphalt, sheet and block, which has been laid at a cost of about \$110,000,000. These pavements are frequently called bituminous pavements, inasmuch as bitumen is the largest constituent of the asphalt, frequently running as high as 9 per cent. Asphalt is manufactured into a cement by mixing it with other forms of bitumen, and this cement is in turn used to bind together particles of sand and limestone in the asphalt pavement. No two asphalts are alike. The life of the pavement depends upon the crude bitumen used, the skill in its manufacture into bituminous cement, the proper proportioning and mixing of the cement with the sand and dust and in the selection of the mineral aggregate.

In 1870, Prof. E. J. Smedt, a Belgian chemist, laid the first sheet asphalt pavement in this country, in Newark, N. J. Prior to this date, coal tar had been used as the cementing material, but with little satisfaction. In 1876 Congress appointed a commission, consisting of Gens. Horatio G. Wright and Quincey A. Gilmore, of the corps of engineers, and Edward Clark, architect of the capitol, to select the best pavement for Pennsylvania Avenue in Washington. Forty-one proposals, for stone, macadam, tar and asphalt pavements, were received. The commission selected two, and decided to use Neuchatel rock asphalt, and De Smedt's artificial Trinidad mixture, in the proportion of two to three. The artificial Trinidad mixture has been most satisfactory. When it was decided, in 1889, to repave Pennsylvania Avenue in Washington, the entire avenue was relaid with it, and the Neuchatel was discarded.

Trinidad Pitch Lake has furnished over 85 per cent of the asphalt used in the United States. The liquid asphalt passing through clay saturates it or carries it in suspension and becomes a brown, earthy, non-viscous substance, chemically composed as follows:

Bitumen	47 per cent
Infusorial earth	28 per cent
Water	25 per cent

The water is evaporated in refining and the residue (approximately one third clay and two thirds hard asphalt) regains some of its viscosity and requires the admixture of some flux or softening agent to give it the proper consistency for paving operations. Samples taken at 100 and 150 feet deep at the centre of Pitch Lake do not differ in composition from those taken on the surface near the shore, showing the homogeneousness of the entire mass. The surface is in constant motion, and gradually lowers as the asphalt is removed. Refined asphalt is shipped from Trinidad to Mexico, South America and other foreign countries; but, owing to the very high duty on refined asphalt coming into the United States, it is cheaper to refine here.

In 1892, the New York and Bermudez Company began the importation of a very pure and hard asphalt from a deposit in the State of Bermudez, Venezuela, and up to the present time about 3,000,000 square yards of pavement have been laid with this material. The Bermudez Asphalt Lake, covering an area of about 1,000 acres, lies about 20 miles from the Gulf of Paria, in a straight line. There are many springs of soft asphalt or maltha, the largest being about 7 acres in area. Outside of the springs, where new material is constantly exuding, the surface of the lake is covered with vegetation and trees, which must first be cut off to reach the asphalt. The quality of the asphalt varies from maltha or liquid asphalt exuding from the springs, to a hard glance pitch. The crude Bermudez asphalt contains on an average about 31 per cent of water, which is present as a mixture and not as an emulsion, and about 66 per cent of bitumen. This asphalt is softer and more brittle than Trinidad, but possesses all essential cementitious qualities.

As early as 1879 asphalt found in Southern California was laid at an intersection on Market Street, San Francisco, which is the heaviest traveled street in that city. In 1884 the late Jesse Warren reported on these California

ASPHALT PAINTING — ASPIDIUM

asphalts, the only indications of which were slight surface exudations of liquid asphalt and large banks of bituminous sandstone (sand saturated with asphalt). In 1895, the Alcatraz Company successfully laid two streets in New York city and acquired a high standing for the California product which was subsequently controlled by the Asphalt Company of America. It has been laid in many Eastern cities, under the trade name of "Alcatraz," "Standard," "Ventura," etc., and has been uniformly successful when refined, mixed and laid intelligently, by men experienced in handling asphalt in all its stages. Shortly after the organization of the Asphalt Company of America, beds of very pure, high grade, liquid asphalt were discovered in Southern California. This being a nearly pure, viscous bitumen, it does not require a softening agent or flux, nor the admixture of other bituminous material, to make it of the proper consistency for paving.

Asphalt Painting. Asphalt was once largely used in painting, especially in the old Dutch school. It was dissolved in spirits of wine to ensure greater permanence. Because of its unreliability it ceased to be used.

Asphalt Process, a photographic process devised about 1814 by J. N. Niepce (q.v.). He coated a plate of polished metal with asphalt varnish, and then placed it with a drawing in a camera obscura for from 4 to 6 hours. The parts of the asphalt which had been acted upon by the light became insoluble. The parts of the asphalt film that had been protected were dissolved by essential oils, and thus a copy of the drawing was brought out. The "heliographs" thus made were not particularly successful. This method has been modified in the asphalt process of photo-mechanical printing. See PHOTO-ENGRAVING.

Asphaltic Coal, coal-like substances which though they have sometimes been classified as coals, differ from all the true coals in respect to both their geological position and their composition. They do not occur in strata, but occupy cavities and fissures, into which they appear to have flowed when plastic. They have been found in Devonian, Carboniferous, and Tertiary rock. The regions in which they are principally mined are Albert County, New Brunswick (albertite), the Uinta Mountains, Utah (gibsonite and uintahite), and Colorado, West Virginia, Texas, and Mexico (grahamite). Wurtzilite is found also in Utah. Their chief uses are as a basis for varnishes, and as insulators. Consult: Blake, 'Uintahite, Albertite, etc.'; 'Transactions' of the American Institute of Mining Engineers, Vol. XVIII. (1890).

Asphodel, a small genus, *Asphodelus*, of hardy annual and perennial fleshy-rooted herbs, natives of the Mediterranean region, belonging to the natural order *Liliaceæ*, but by some botanists made the type genus of the natural order *Asphodelæ*. *A. luteus*, *lutea*, king's spear, or yellow asphodel, the true asphodel of the ancients, attains a height of two to four feet, has numerous long (3 to 12 inches) narrow rough-margined leaves which embrace the stem, and in early summer yellow flowers in long racemes (6 to 18 inches), and large persistent membranous bracts. *A. albus*, branching or white asphodel, which has radical leaves, blossoms about

the same time as the preceding species, and produces its white funnel-shaped blossoms in branched clusters. Both species are readily propagated by division and are of easy cultivation in any soil. They thrive fairly well in partial shade, but do better when more or less exposed to the sun. *A. ramosus*, a species which by some botanists is made to include *A. albus* and many other species, is cultivated in Algeria and some other countries for its starchy roots which are used to make alcohol. The refuse from this manufacture, together with the leaves and stems, is employed in paper and cardboard-making. Several other related plants are often called asphodel, among which are *Narthectum ossifragum*, bog asphodel, common on European moors; *N. americanum*, by some botanists considered a form of the preceding, and *A. californicum*, similarly called in America. False asphodel is a name given to several species of *Tolstedia*. The asphodel of the poets is *Narcissus pseudo-narcissus*.

Asphyxia, etymologically, pulselessness, but literally a condition of partial or complete loss of consciousness because of defective oxidation of the blood. The symptoms may be developed rapidly or slowly. In sudden occlusion of the air passages, such as caused by a foreign body in the larynx, or compression of the throat as in hanging, there is usually a quiet period of from 20 to 30 seconds after which respiratory movements, both of inspiration and of expiration, follow. These gradually increase in frequency and depth until in about a minute powerful expiratory convulsions occur; convulsive movements of inspiration are also produced, but these are usually milder in character. A period of exhaustion sets in, the respiratory movements become slower and more irregular, and gradually cease. During this period the face has become pallid, and then deeply cyanosed and flushed, the lips blue to purple, and the body temperature, at first increased, gradually diminishes. The blood pressure is at first increased, and then falls gradually to zero. Unconsciousness develops about a minute after the occlusion, although there is great individual variation, the sphincters relax and the urine and feces are passed. There is a loss of muscle-tone, and the reflexes are abolished. In asphyxia both lack of oxygen and increase of carbonic-acid gas in the blood are important factors. Asphyxia may result from an excess of carbonic-acid gas with a normal amount of oxygen, and may be produced, if the amount of oxygen is diminished one half, with no variation of the carbon dioxide. For treatment, see DROWNING.

As'pic, a dish consisting of a clear, savory meat jelly, containing fowl, game, fish, etc

Aspid'ium, a widely distributed genus of ferns, numbering upward of 500 species, of which more than a dozen are found in the United States, including the male and shield ferns. Their only economic use is in medicine. The active principles in this and allied species are filicic acid, aspidin and other phloroglucin-like bodies. The action is largely on the tape-worm, for which parasite this drug is given. Poisonous symptoms sometimes are produced. These are pain, muscular weakness, purging, collapse, and even death. Temporary blindness has been produced by male fern.

ASPINWALL — ASS

As'pinwall, William, an American physician: b. Brookline, Mass., 23 May 1743; d. 16 April 1823. He studied medicine in Philadelphia, and practised in his native town. He served as surgeon with the Revolutionary army, and later became interested in the subject of vaccination and established that preventive in American practice.

As'pinwall, William H., an American constructor of railroads: b. New York city, 16 Dec. 1807; d. 18 Jan. 1875. He was for many years a partner in a large shipping firm in New York, but retiring from it in 1850, turned his attention to building the Panama Railroad, whose eastern terminus of Aspinwall is named in his honor. He was likewise prominent in forming the Pacific Mail Steamship Company.

As'pinwall, or Colon, the Atlantic terminus of the Panama Railroad; a South American seaport in the Republic of Panama. It is situated on the small island Manzanilla, in Navy or Limon Bay, which forms its harbor. It was founded in 1850 by the Panama Railroad Company. Its population varies with the work on the Panama Canal.

As'pirate, in grammar, an accent peculiar to the Greek, marked thus (´), and importing that the letter beneath ought to be strongly aspirated, that is, pronounced as if an *h* were prefixed.

As'pira'tor, an apparatus employed to promote the flow of a gas from one vessel into another by means of a liquid. Its simplest form is a cylindrical vessel with a pipe at the upper end communicating with the vessel containing the gas, and a pipe at the lower end also, with a stopcock, and with its extremity bent up. By allowing a portion of the water to run off by the pipe at the lower part of the aspirator a measured quantity of air or other gas is sucked into the upper part.

Aspiroz, as-pē-rōth, **Manuel de**, a Mexican statesman and diplomatist: b. Puebla, 1836. He was Mexican consul at San Francisco 1873-5, law professor in the College of Puebla, 1883-90, and was appointed secretary for foreign affairs in the year last named. In 1899 he succeeded Señor Romero as ambassador to the United States. He has published 'Código de extranjería de los Estados Unidos Mexicanos' (1876); and 'La libertad civil como base del derecho internacional privado' (1896).

Asple'nium, a genus of about 200 species of small ferns of world-wide distribution, belonging to the sub-order *Polypodiaceæ*, characterized by free veins and elongated sori covered by an indusium. Many of the species are very beautiful and are consequently favorites with cultivators whose space is limited. *A. viride*, *A. adiantum-nigrum*, *A. trichomanes*, and other species are commonly called spleenwort from their formerly supposed efficacy in internal medicine. The two last-mentioned species also bear the name of maiden-hair, but are not the true maiden-hair fern (*Adiantum*). In the eastern United States a dozen or more species are to be found growing wild, among which the more common are *A. thelypteroides*, *A. angustifolium*, and *A. felix famia*, which reach a height of from one to four feet. In cultivation, slight shade is almost essential, as is also abundant water at the roots, but the air must not be very

moist else the leaves will turn brown. The plants thrive in light friable peaty soil. Species of this genus have been identified in rocks of Middle Jurassic time, thus indicating the antiquity of the group.

Aspromon'te, as'promōn'ta, a mountain of Italy, near where Garibaldi was wounded and taken prisoner with the greater part of his army, in August 1862.

As'quith, Herbert Henry, an English statesman: b. Morley, Yorkshire, 12 Sept. 1852, and educated at Balliol College, Oxford. He studied law and was admitted to the bar of Lincoln's Inn in 1852. He entered Parliament in 1886 as member for East Fife, and was re-elected in 1892 and in 1895, and was home secretary in Gladstone's last cabinet. He was conspicuous as a debater during the Home Rule discussions, and in 1894 drew up the Welsh Church Disestablishment Bill. Although prominent as a Liberal he stated publicly, in 1901, that his branch of the Liberal party favored the Boer war.

As'rael, or **Azrael**, in the Mohammedan mythology, the angel of death

Ass (As. *assa*, Goth. *asilus*, Rus. *osclu*, Lat. *asinus*, probably of Eastern origin; cf. Heb. *āthōn*, she-ass) or, when domesticated, *Donkey*. A member of the family *Equidæ* and usually placed in the genus *Equus*, with the horse, though sometimes made the type of a separate genus, *Asinus*. There are at least three species, one Asiatic, and the others African. From the North African species the domesticated ass or donkey has probably descended, although many of its characteristics, particularly its spirit and bearing, are greatly altered. In size, in the short hair and terminal tuft of the tail, and in the fact that only the fore-legs present callosities, the ass resembles the zebra rather than the horse; and although not striped like the zebra, it has a varying tendency to stripes on the legs. The Asiatic ass (*Equus hemionus*) is divided into three local varieties, of which the one found in Persia and Syria must be that which the Old Testament writers used as a type of unhampered wildness. Of the others, the kiang, koulán, or dziggetai of Thibet, is the largest and most strikingly colored. Its height is sometimes four feet at the shoulders. Like all asses, it is pale underneath, but the color above is a dark red with a narrow black stripe along the mane and backbone from head to tail. The third variety, the onager or ghorkhar, like the first, is smaller and paler; sometimes it is even silvery, and its dorsal stripe is broader in proportion than that of the Thibetan ass. It inhabits the plains of northwestern India, Afghanistan, and Beluchistan. Unlike the donkey, these wild asses are so extremely swift, enduring, and agile that on the plains they cannot be overtaken by a single horseman. In the mountains they are less shy, and sometimes voluntarily approach travelers. Wild asses are hunted for sport, and it is said of their flesh, that, while resembling venison, it has an even finer quality. The asses of the plains migrate to the hills in summer when the plains are dry. See KIANG; ONAGER.

The African ass (*Equus Africanus*) differs widely from the Asiatic, being larger and having a bluish tint rather than a tendency to red.

It is sometimes as much as 14 hands high, and has the very large ears which characterize the donkey. The dark stripe on the back begins only at the shoulder, but extends from the tail down the withers; the hair of the mane and tail is short, and varies little from that of the body in color. It is found in all the open regions of northeastern Africa, and westward through the Sahara and Sudan. Like the Asiatic ass, it is extremely wild and fleet. A second species of African wild ass (*Equus somalicus*) was found in Somaliland a few years ago (see Proc. Zool. Soc. of London, 1884, p. 540), which is distinguished by its grayer color, and faintness of its stripes; it also has smaller ears and a more flowing mane. Living examples have been kept in London.

The leading authorities on these animals are Blanford and Tegetmeier, the latter the author of 'Horses, Asses, and Zebras' (1895).

The donkey, or domestic ass, was probably first tamed in Egypt, where it was known before the horse, and has always been much used; some of the Eastern breeds of the donkey are far larger and finer than those commonly seen in Europe, though in Spain and Italy, where they are more used, they are superior to those of other European countries. In England they are little employed, but in America are kept by stock raisers in the Middle and Southern States for the breeding of mules and hinnies. (See MULE) Their milk is recommended in cases of consumption and dyspepsia, and their skins furnish the leather called shagreen, besides an excellent shoe-leather and the covering of drums.

Ass, Feast of the, a mock ceremony observed in northern France in the Middle Ages. It was originally a good-natured parody on the church service without intentional irreverence, but degenerated into an indecent performance. It was in substance a brief farce in which Balaam's ass appeared before the church altar to prophesy the coming of Christ.

Assab, as-sab', an Italian trading station on the coast of the Red Sea, 40 miles from the Strait of Bab-el-Mandeb. The neighboring district with an area of 243 square miles, was sold in 1870 by some Danakil chieftains to an Italian steamship company for a coaling station on the road to India. In 1880 it was taken over by the Italian government, which, since 1884, has improved the harbor and erected a lighthouse.

Assai, as-si', a food made from the fruit pulp of various species of Brazilian palms closely allied to the cabbage palm (q.v.) and largely used in the lower Amazon region. The principal species are *Euterpe edulis* and *E. Catinga*. The first species grows in tide-flooded swamps, where it may attain a height of 90 feet with a diameter of only four or five inches. It produces upon branched spadices an abundance of small pea-like purple fruit with a thin firm pulp and a hard seed. These fruits are kneaded in warm water to produce the thick purplish assai which is generally eaten with starchy foods. The terminal bud of this species is eaten like that of its close relative, *E. oleracea*, the cabbage palm, and its stems are used as rafters and poles. The other species grow on dry, sandy, upland soils, its smaller quantity of fruit furnishing a sweeter assai.

Assal, as-sal', a large salt lake in the district of Adal, in eastern Africa, near the coast of the Bay of Tajura. It is nearly 600 feet below the level of the sea. Abyssinian caravans resort to Assal for the purpose of carrying off the salt, thickly encrusted on its shores.

Assam', a chief-commissionership of British India, situated mainly between Upper Burma and the Himalayas, with an area of 52,078 square miles. It may be considered as a long series of fertile valleys watered by the Brahmaputra and its tributaries. The valley of the Brahmaputra consists of rich alluvial plains, either but little elevated above the flood-level of the Brahmaputra and its feeders, or so low that large extents of them are flooded for three or four days once or twice in the year. The Surma valley is even more subjected to inundations than the plains of the Brahmaputra, but the Surma and its tributaries having more permanent banks, the shifting is trifling compared with the banks of the Brahmaputra. In Assam are found the valuable teak and sissoo trees, date, and sago palms, the areca palm (the betel-nut-tree), the Indian fig tree, etc. But the article of most commercial importance grown in Assam is tea. The plant was discovered growing in this region in 1823, but not till 1838 did the first shipment reach England. The plant producing it, though not regarded as specifically distinct from that of China, is much larger and more vigorous. There are now about 300,000 acres under tea; the yield is about 100,000,000 pounds annually. Rice covers a large extent of the cultivated soil, occupying about 1,500,000 acres. The other crops include maize, pulse, oil-seeds, sugar-cane, hemp, jute, potatoes, etc. In the jungles and forests roam herds of elephants, in the dense and swampy parts of the forests the rhinoceros is met with, and tigers and wild buffaloes abound; leopards, bears, and wild hogs are numerous, and among other animals are jackals and foxes, goats, deer, and the venomous cobra. Coal, petroleum, limestone, and iron are found, and gold-dust is met with in many of the rivers. The coal-beds are supposed to be co-extensive with the main valley, but coal is only worked to the south of the Brahmaputra. The inhabitants are mostly engaged in agriculture. There is no Assamese nation proper, various ethnical groups being represented. The people seem to be contented, good-natured, and indolent, and have few wants beyond what can be easily supplied from their fertile fields, for which they pay but a very small rental. Great respect is paid to the aged; parents, when no longer able to work, are supported by their offspring; they are tenderly attached to their children, kind to their relatives, and hospitable to people of their own caste. Assam, known in ancient Indian history as Kāmarūpa, formed in the 7th century A.D. a powerful independent kingdom under a Brahman sovereign, but in the 15th century it broke up into 12 separate states, which, in spite of their numerous internal struggles, were generally able to resist the attacks of the powerful Mogul emperors. Late in the 18th century its condition encouraged the Burmese to make the country a dependency of Ava, but the Burmese encroachments on the territory of the East India Company brought about war with the British. In 1826 Assam became a possession of Great

ASSAS — ASSAULT

Britain under the administration of the lieutenant-governor of Bengal, and in 1874 was erected into a chief-commissionership. There are no towns properly so-called, but some large villages. The seat of administration is Shillong. Pop. (1901) 6,122,201.

Assas, äs'sä, **Nicolas, Chevalier d'**, a French officer, celebrated for an act of patriotism which cost him his life. He was captain in the regiment of Auvergne when the French army was stationed near Gueldres, in 1760, and on 15 October, while engaged in reconnoitering, was taken prisoner by a division of the enemy advancing to surprise the French camp, and threatened with death if a word escaped him. He shouted, "*A moi, Auvergne, voilà les ennemis!*" and was instantly struck down. An annual pension was allowed to his descendants.

Assas'sina'tion, a term denoting the murder of any one by surprise or treachery. It is commonly applied to the murder of a public personage by one who aims solely at the death of his victim. In ancient times, assassination was often even applauded, as in the Scriptural instances of Ehud and Jael, and in the murder of Hipparchus by Harmodius and Aristogeiton; but assassination by enthusiasts and men devoted to an idea first became prominent in the religious struggles of the 16th and 17th centuries. To this class belong the plots against the life of Queen Elizabeth; while the succession of assassinations of Roman emperors is but a series of murders prompted by self-interest or revenge. Omitting these last, the following list includes the most important assassinations, arranged in chronological order. Fuller accounts of the persons mentioned will be found under their particular headings:

Philp of Macedon.....	B.C.	366
Julius Cæsar.....	Mar. 15	B.C. 44
Thomas Becket.....	Dec. 29,	A.D. 1170
Albert I. Emperor of Germany.....	May	1, 1308
James I. of Scotland.....	Feb.	21, 1437
Alessandro de Medicis.....	Jan.	5, 1537
Cardinal Beaton.....	May	29, 1546
David Riccio.....	Mar.	9, 1566
Lord Darnley.....	Feb.	10, 1567
James, Earl of Murray, Regent.....	Jan.	23, 1570
William of Orange.....	July	10, 1584
Henry III. of France.....	Aug.	1-2, 1589
Henry IV. of France.....	May	14, 1610
Villiers, Duke of Buckingham.....	Aug.	23, 1628
Wallenstein.....	Feb.	25, 1634
Archbishop Sharp.....	May	3, 1679
Gustavus III. of Sweden, Mar. 16; d.....	Mar.	29, 1792
Marat, by Charlotte Corday.....	July	13, 1793
Gen. Kleber at Cairo.....	June	14, 1800
Paul, Czar of Russia.....	Mar.	24, 1891
Spencer Perceval, premier.....	May	11, 1812
Kotzebue, the dramatist.....	Mar.	23, 1819
Duc de Berri.....	Feb.	13, 1820

Premier Canovas del Castillo, Spain.....	April	22, 1897
President Juan Idiarte, Uruguay.....	Aug.	25, 1897
Empress Elizabeth of Austria, in Geneva.....	Sept.	10, 1898
President Ulisses Heureaux, Santo Domin- go.....	July	26, 1899
King Humbert of Italy.....	July	29, 1900
President McKinley, Sept. 6; d.....	Sept.	14, 1901
Alexander of Servia.....	June	11, 1903

Many attempts at assassination have been unsuccessful. Among those within the last century may be named: Against Alexander III. of Russia, repeatedly; Alfonso XII. of Spain, 1878 and 1879; Amadeus of Spain, 1872; Duc d'Aumale, 1841; Prince Bismarck, 1866 and 1874; Francis Joseph of Austria, 1853; George III. of England, 1786 and 1800; George IV. (when Regent), 1817; Humbert I. of Italy, 1878 and 1897; Isabella II. of Spain, 1847, 1852, and 1856; Louis Philippe, six attempts, from 1835 to 1846; Lord Lytton, viceroy of India, 1878; Napoleon I., by infernal machine, 1800; Napoleon III., twice in 1855, and Orsini's attempt in 1858; Queen Victoria, 10 June 1840, 30 May 1842, 3 July 1842, 19 May 1849, and 2 March 1882; William I. of Germany, 1861, 1875, and twice in 1878; President Diaz of Mexico and President Morales of Brazil, both in 1897; and the Prince of Wales in 1900.

Assas'sins, a term applied to a secret order of religious fanatics who flourished in the 11th and 12th centuries. They derived their name of assassins originally from their immoderate use of hasheesh, which produces an intense cerebral excitement, often amounting to fury. Their founder and lawgiver was Hassan-ben-Sabah, to whom the Orientals gave the name of Sheikh-el-Jobelz, but who was better known in Europe as the "Old Man of the Mountain." Their principal article of belief was that the Holy Ghost was embodied in their chief, and that his orders proceeded from the Deity. They believed assassination to be meritorious when sanctioned by his command, and courted danger and death in the execution of his orders. They were frequently styled Ismaili. A feeble residue of the sect, from whom proceeded the Druses, about A.D. 1020, has survived in Persia and Syria. The Syrian Ismaili dwell around Mesiodé, and on Lebanon. They are under Turkish dominion, with a sheik of their own, and formerly enjoyed a productive and flourishing agriculture and commerce. Since the war with the Nasserians, 1809-10, they have dragged out a miserable existence, but are commended by modern travelers for their hospitality, frugality, gentleness, and piety.

Assault. In law, an assault is a movement virtually implying a threat to strike, as when a person raises his hand or his cane in a menacing manner, or strikes at another but misses him. It is not needful to touch one to constitute an assault. When a blow actually takes effect, the crime is not simple assault, but assault and battery. Assault, however, is usually coupled with battery, and for the reason that they generally go together; but the assault is rather the intimation or offer to commit the act of which the battery is the consummation. An assault is included in every battery. An aggravated assault is one performed with the intention of committing some additional crime, such as an assault with intent to commit rape, assault with intent to murder, an assault with a deadly weapon, an indecent assault. The defenses usually interposed in cases of assault are self-defense, recapture of property, ejectment of trespassers, defense of property, defense of family, accident, etc. A person assaulting another may be prosecuted by him for the civil injury, and also be punished by the criminal law for the injury done to the public.

ASSAYE; ASSAYING

In military language an assault is a furious effort to carry a fortified post, camp, or fortress, where the assailants do not screen themselves by any works. It is the appropriate termination of a siege which has not led to the capitulation of the garrison. To give an assault: To attack any post. To repulse an assault: To cause the assailants to retreat; to beat them back. To carry by assault: To gain a post by storm. In fencing, an assault of arms is an attack on each other (not in earnest), made by two fencers to exhibit or increase their skill. (Sometimes it is used in a wider sense for other military exercises.)

Assaye, as-si', a village in southern India, where Wellington gained a famous victory in 1803. With only 4,500 troops at his disposal he completely routed the Mahratta force of 50,000 men and 100 guns. The victory, however cost him the loss of more than a third of his men.

Assaying, the art of testing ores or alloys, for the purpose of determining the amount of some particular metal that is present in the material analyzed. Assays may be made by "wet" or "dry" methods, and will vary greatly in detail, according to the metal to be determined. The present article will be chiefly devoted to the usual process of estimating gold and silver in the "dry" way. The mode of procedure is substantially the same, whether the assay is made upon ore or upon bullion, except as to the method of obtaining the sample to be examined. If the material proposed for the assay is bullion, or any metallic alloy, the sample for examination is obtained by drilling into the specimen in different places, and mixing the borings. In the case of an ore, the usual method of obtaining a sample for assaying is by "quartering." If this is done by hand, every tenth shovelful of the ore to be examined is thrown upon the floor, until a conical heap containing perhaps ten tons has been accumulated. This heap is next flattened somewhat, and divided into four quarters, as nearly equal as possible. Two of the diagonally opposite quarters are thrown back into the main body of ore, and the remaining two quarters are thoroughly mixed, spread out into a second pile, and "quartered" again in the same manner. The process is continued (the ore being crushed in the meantime as often as appears necessary) until the original sample has been reduced to from one to three pounds, after which it is ground fine, and the specimens desired for examination are made up by random selections from the final pulverized product. More commonly, ores are sampled by mechanical or semi-mechanical methods, and the sampling is not done by the miner, but by a "sampling mill," which acts as the agent both of the miner and of the smelting works. In such cases the ore is first shipped to the sampling mill, where it is unloaded, weighed, crushed, and passed through a chute, in which one quarter is mechanically selected and passed into a separate bin. The quarter thus mechanically reserved is next thoroughly mixed, after which the "cutting down" is commenced. This consists in removing the ore from the floor by means of a specially-constructed sampling shovel which catches about half of it, and lets the remainder fall into a barrow. The ore retained by the shovel is thrown into three buckets, in rotation, and the contents of the buckets are then coned up in one

pile, and divided again in the same manner. The ore is then further crushed, and the process is continued until, finally, three samples, weighing about ten pounds each, are obtained. Part of each of these is sent separately to the assayer, who assays all three. If the results are not adjudged to be sufficiently accordant, the sampler concludes that the mixing was not well done, and the operations described are repeated. But if the three samples agree fairly well, their average is taken as representing the value of the ore; and on this basis the sampler settles with the miner, and afterward with the smelter, thus acting as a middle-man in the sale of the ore.

The specimen of ore received by the assayer is ground fine enough to pass through a 60-mesh or a 100-mesh screen, any "metallics" (or particles of metal that will not pass through the screen being carefully collected and reserved for a separate assay. If the ore is new to the assayer, his next step is to examine it microscopically, and to apply various preliminary tests, so that the general nature of the ore may be known before the quantitative work begins. If assays of the same material have been made before, and the only object is to ascertain the richness of this particular lot of ore, he may proceed directly to the process of "scorification," by which the gold and silver present in the ore are obtained in the form of a metallic button. The scorification process depends for its success upon the fact that when an ore of gold and silver is strongly heated with metallic lead in the presence of air, the base metals that are present will oxidize, and the lead oxid that is also formed will dissolve the silica (or quartz) that is present; while the gold and silver will not oxidize, but will be left in the metallic state, alloyed with that portion of the lead which remains unoxidized. To apply this principle, 50 grains or so of the ore are mixed with some 500 grains of granulated lead, and placed in a sort of crucible, called a "scorifier." Another charge of 500 grains of lead is spread evenly over the mass, and a few grains of borax are sprinkled upon the top. The crucible and its contents are next heated for about three-quarters of an hour in a muffle to which a small amount of air is admitted, after which the melted mass in the crucible is poured into a mold to "set," or cool. When the mold is cold, it will be found to contain a button of metallic lead (in which the gold and silver originally in the ore are concentrated), and also a considerable amount of slag, consisting of oxid of lead, oxids of the base metals that are present in the ore, and silicates of lead, derived from the combination of the melted lead oxid with the quartz of the ore. The slag is readily detached from the metallic button by taps with a hammer.

The next step is to "cupel" the button, so as to obtain the gold and silver in a pure state. Cupellation is based upon the fact that when an alloy of gold, silver, lead, and base metals is heated in a current of air, the lead and the other base metals will oxidize, and the melted lead oxid ("litharge") will retain the other oxids in solution. Moreover, if the crucible in which the operation is carried out is porous, the melted lead oxid will soak into it, carrying the base oxids with it, and leaving a button of pure gold and silver behind.

ASSAY OFFICES—ASSEMBLY OF DIVINES

The "cupel" in which this is performed is made of bone-ash, and after the button left from the scorification process has been heated in the cupel for a short time, the process indicated above takes place, its completion being indicated, to the practised eye, by a play of iridescent colors on the cupelled button. The button is finally allowed to cool, and after it has been taken from the cupel, any small particles of bone-ash that remain adhering to it are removed by a brush.

If the original ore contained no silver, the assay is now completed, and it only remains to weigh the gold button, and compare its weight with that of the sample of ore used in the assay. But if silver is present, one other process, known as "parting," must be carried out, in order to separate the gold from the silver. Parting depends upon the fact that nitric acid will dissolve the silver out of an alloy of silver and gold, *provided* the weight of silver present is at least 2.5 times as great as the weight of the gold. In order to ensure the fulfillment of this necessary condition, the button, as it comes from the cupel, is melted with 2.5 or 3 times its own weight of silver that is known to be free from gold, and the alloy so formed is flattened out into a thin plate or ribbon, which is then rolled up into a little spiral, or "cornet," and boiled in nitric acid. The cornet is next washed in distilled water, and boiled again in nitric acid, to remove the last traces of silver; after which it is thrown into a crucible and melted into a button, for weighing. The button obtained by this final process consists of pure gold.

Assay Offices in the United States are government establishments in which citizens may deposit gold and silver bullion, receiving in return its value, less charges. The offices are in New York city; Boise City, Ida.; Helena, Mont.; Denver, Col.; Seattle, Wash.; San Francisco, Cal.; Charlotte, N. C.; and St. Louis, Mo.

The assay office in New York was established by law in 1853, and was opened in the autumn of 1854. The first assayer of the New York assay office was Dr. John Torrey of Columbia College, who was appointed in 1854 and held his position till 1873. On his death he was succeeded by his son, Herbert Gray Torrey, who has been in the office for 40 years. The superintendent of the assay office is Andrew Mason, who was appointed to his present position in 1883, having previously been assistant assayer and melter and refiner. While holding the latter office he substituted the use of sulphuric for nitric acid in the refining process, thus saving this one assay office \$100,000 per annum.

The United States assay office is in a building located beside the more imposing sub-treasury building, at the intersection of Wall and Broad streets, which marks one of the most historic spots in the country, namely, the site of the old Federal Hall, where Washington took the oath as first President of the United States. Although the building is small, yet it only masks a really large, inner building surrounded on all sides by office buildings and the sub-treasury. The assay offices, and particularly this one, have an important position in the world of finance, for here the precious metals—gold and silver—in all forms and conditions of fineness are assayed and refined. In

brief, the work of this office consists in assaying or determining the value of gold and silver, in whatever form presented, as coin, jewelry, or in any other shape. Any one wishing to have gold or silver assayed in quantity or wishing to sell to the government, may present his property at the assay office, where he may have the metal reduced and made into bars, or if he prefers, he may sell his bullion to the government. The charge for doing the work is merely nominal, and based on the actual cost. Millions of dollars are stored at all times in the vaults. When the metal is received, the first step consists in weighing the coin, bars, jewelry, or tableware. This is done with great exactness and a receipt is given. Each person's holdings are placed in a box and are taken to the melting-room, where they are placed in crucibles with a flux and smelted and cast in ingot molds, the pouring being a highly picturesque operation. A small chip is taken from the bar for assay. See COINAGE.

If the depositor wishes to part with his bullion, the government pays for it at the prevailing price and proceeds to separate or part the gold from the silver. The price of gold never varies, costing \$20.67 a fine ounce. Silver fluctuates with the market.

The importance of the assay office in its relation to the financial world, the treasury, and the mint cannot be overestimated. During the fiscal year ending 30 June 1900, the fineness of 11,802 melts of gold and silver deposits, 993 melts of fine gold and silver, also 1,050 melts of mixed metal, about 500 special deposits, 350 barrels of sweeps, 83,178 gold and silver bars were estimated, and about 60,000 cupels and the necessary "proof" gold and silver were made.

Assay Offices. See ASSAYING.

Assegai, ăs'se-gă, a short spear employed as a weapon among the Kaffirs of South Africa. It is made of hard wood tipped with iron, and used for throwing or thrusting.

Assemani, as'-e-ma'ne, (1) JOSEPH SIMON, a famous Orientalist: b. of a Maronite family in Tripoli, Syria, 1687; d. Rome, 14 Jan. 1768. He traveled on the Pope's commission through Egypt and Syria, collecting many Oriental manuscripts and coins for the Vatican library, of which he was appointed keeper. Of his numerous learned works, the most important is his 'Bibliotheca Orientalis Clementino-Vaticana' (1719-28), containing the Syrian manuscripts of the Vatican. He was succeeded as keeper of the Vatican library by his nephew. (2) STEPHEN EPHODIUS (1707-82), also a learned author of books on Oriental learning. He was titular bishop of Apomaca. Yet another nephew and Orientalist was (3) JOSEPH ALOYSIUS (1710-82), professor at Rome. (4) SIMON, a relative of the preceding, b. in Tripoli 1752; d. Padua 8 April 1821. He filled the chair of Oriental languages at Padua. One of the greatest Orientalists of his time, he wrote an important work on ancient coins, 'Museo Cufico Naniano Illustrato' (1787-8).

Assem'ly, Constituent. See ASSEMBLY, NATIONAL.

Assem'ly of Divines, a celebrated assembly appointed by the Long Parliament, and held at Westminster to determine upon the doctrine

¹ Humid Assay for Silver. ² Muffle Furnaces for Fire Assay. ³ Weighing Room. ⁴ Pressing the Assay Sample.

ASSEMBLY — ASSESSOR

and liturgy of the English Church. By an ordinance passed 12 June 1643, 121 clergymen, with 10 Lords and 20 Commoners as lay assessors, were nominated as constituents of the assembly. The assembly began its sittings in July 1643, in Westminster Abbey, but in the meantime a royal proclamation had been issued forbidding the assembly to meet, which had the effect of inducing the greater part of the Episcopal members to absent themselves. The majority of those who remained were Presbyterians, but there was a strong minority of independents. A deputation was now sent along with commissioners from the English Parliament to the General Assembly of the Scottish Church and the Scottish Convention of Estates, soliciting their co-operation in the proceedings of the Westminster Assembly, and in September four Scottish clergymen, with two laymen, were admitted to seats and votes. The assembly continued to hold its settings till February 1649. Among the results of its deliberations were the Directory of Public Worship, the Confession of Faith, and the Larger and Shorter Catechisms, which remain practically the standards of the Presbyterians to the present day. At the Restoration the whole proceedings of the Westminster Assembly were annulled as invalid. See Hethorington, 'History of the Westminster Assembly,' 1843; Masson, 'Life of Milton' (1858-79).

Assem'ly, General, the name applied to the highest ecclesiastical court of the Established Church of Scotland. It consists of delegates from every presbytery, university, and royal burgh in Scotland, holds meetings annually, in the month of May, and usually continues to sit for 12 days. In its judicial capacity and as the court of last resort, the General Assembly has a right to determine finally every question brought from the inferior courts, by reference, complaint, or appeal. The laws enacted by the assembly, after receiving the sanction of a majority of presbyteries, are the established and permanent statutes of the Church, by which everything belonging to the ecclesiastical state, or to the Church courts, is authoritatively regulated. The United Free Church of Scotland has a General Assembly similar in its constitution and functions to that of the Established Church, and the same is true of the Presbyterian churches of Ireland and America. See PRESBYTERIAN CHURCHES.

Assem'ly, National, a body established in France in 1789. Upon the convocation of the states-general by Louis XVI., the privileged nobles and clergy refused to deliberate in the same chamber with the commons, or *tiers-état* (third estate). The latter, therefore, on the proposition of the Abbé Siéyès, constituted themselves an *Assemblée Nationale*, with legislative powers, 17 June 1789. They bound themselves by oath not to separate until they had furnished France with a constitution, and the court was compelled to give its assent. In the 3,250 decrees passed by the assembly were laid the foundations of a new epoch, and having accomplished this task, it dissolved itself 30 Sept. 1791. The term is also applied to a joint meeting of the Senate and Corps Legislatif, for the purpose of electing a chief magistrate or the transaction of other extraordinary business. See

Stephens, 'History of the French Revolution' (1886-91); Doniol, 'La Révolution et la Féodalité' (1874).

As'sen, a'sën, the capital of the province of Drenthe, Holland. Near it are the Giants' Caves, to which Tacitus makes allusion. Pop. 11,191.

Assent', in law, an undertaking to do something in compliance with a request. Approval of something done. Express assent is that which is openly declared. Implied assent is that which is presumed by law. Assent must be to the same thing in the same sense. It must embrace the whole of the proposition, must be exactly equal to its extent and provisions, and must not qualify them by any new matter. Unless express dissent is shown, acceptance of what it is for a person's benefit to take, is presumed, as in the case of a conveyance of land.

The Royal Assent is the approbation given by the sovereign in Parliament to a bill which has passed both houses, after which it becomes a law. It may be given in person, when the sovereign comes to the House of Peers and the assent (in Norman French) is declared by the clerk of Parliament; or may be declared by letters-patent under the great seal, signed by the sovereign.

Asser, a'ser, John, a learned British ecclesiastic, distinguished as the instructor, and biographer of Alfred the Great. He was appointed abbot, by Alfred, of two or three different monasteries, and at last promoted to the Episcopal See of Sherborne, where he died in 908 or 910. He wrote the life of Alfred ('*Annales Rerum Gestarum Ælfredi Magni*'), which was first published at the end of Parker's edition of Walsingham's History (London, 1574) in Camden's Historical Collection (at Frankfurt). A separate edition was published at Oxford in 1722. An English translation is given in Bohn's Antiquarian Library.

Assess'ment is the determining of the value of a man's property or occupation for the purpose of levying a tax. Determining the share of a tax to be paid by each individual. Laying a tax. Adjusting the shares of a contribution by several toward a common beneficial object according to the benefit received. Assessment of damages includes fixing the amount of damages to which the prevailing party in a suit is entitled. It may be done by the court through its proper officer, the clerk or prothonotary, where the assessment is a mere matter of calculation, but must be done by a jury in other cases. Insurance assessment is an apportionment made in general average upon the various articles and interests at risk, according to their value at the time and place of being in safety for contribution for damage and sacrifices purposely made, and expenses incurred for escape from impending common peril. An assessment is also made upon premium-notes given by the members of mutual fire insurance companies, constituting their capital, and being a substitute for the investment of the paid-up stock of a stock company, the liability to such assessments being regulated by the charter and by-laws, 12 N. Y. 477; 14 Bart. N. Y. 374.

Asses'sor, a person appointed to ascertain and fix the amount of taxes, rates, etc., or one who sits with the judges in certain courts,

ASSETEAGUE — ASSINIBOIN

and assists them with his professional knowledge.

Asse-teague (ăs'se-tēg') **Island**, a small island off the coast of Virginia in Northampton County. Upon it is a lighthouse 150 feet in height.

As'sets (French, *assez*, enough), a term denoting property or goods available for the payment of a bankrupt or deceased person's obligations. Assets are either personal or real, the former comprising all goods, chattels, etc., devolving upon the executor as salable to discharge debts and legacies. In commerce and bankruptcy the term is often used as the antithesis of liabilities, to designate the stock in trade and entire property of an individual, or an association. See **BANKRUPTCY**.

Assiento, asyān'tō (Spanish, *asiento*, seat, contract, treaty), a term especially applied to an agreement between the Spanish government and a foreign nation to import negro slaves from Africa into the Spanish colonies in America, for a limited time, on payment of certain duties. The English were the sole possessors of this assiento till 1701. In 1713 the celebrated assiento treaty with Britain for 30 years was concluded at Utrecht. By this contract the English, among other privileges, obtained the right of sending a *permission* or *assiento ship*, so called, of 500 tons every year, with all sorts of merchandise, to the Spanish colonies. By the treaty of Madrid, 5 Oct. 1750, the contract was annulled.

As'signa'tion. See **ASSIGNMENT**.

Assignats, a-se-nyā, or ăs-īg-nāts, a term applied to the paper money issued during the French Revolution. The French National Assembly after appropriating to national purposes the land belonging to the Church, instead of selling it at a time when its value was greatly depreciated, because of the unsettled state of affairs, issued bonds on the security of it, which were called assignats, as representing land *assigned* to the holder. This paper currency consisted chiefly of notes for one hundred francs each, though many of them were for lower sums. The first issue in 1790 amounted to 400,000,000 francs. The government was relieved by this plan, for the time being the assignats saved the Revolution. This arrangement for relieving the necessities of the government seemed so easy that recourse was repeatedly had to it, as the property of wealthy emigrés, until the amount arose to the vast sum of 46,000,000,000 francs, besides many forged notes. The consequence was that the value of assignats sank to almost nothing. In March 1796, a louis d'or (24 francs) bought 7,200 francs in assignats. They were withdrawn from the currency after this, and redeemed at a thirtieth of their nominal value, by "territorial mandates," a new kind of paper currency, which empowered the holder at once to take possession of public lands at the estimated value, while assignats could only be offered at a sale. These territorial mandates afterward became almost worthless and were returned to the government in payment of taxes or of land. Early in 1797 the system came suddenly to an end.

As'signee', any person appointed by another to transact some business, or exercise some

particular privilege or power. Formerly the persons appointed under a commission of bankruptcy, to manage the estate of the bankrupt on behalf of the creditors, were so called, but are now known as trustees, or receivers. The term assignee is also used to designate one to whom an assignment has been made.

Assign'ment, a term denoting a transfer by deed of any property, or right, title, or interest in property, real or personal. Assignments are usually given for leases, mortgages, and funded property. In the United States, assignment is of broader signification and applies also to the transfer of real property by certain conveyance. In general, every right of property, real or personal, and every demand connected with a right of property, real or personal; and all choses in action, as bonds, notes, judgments, mortgages, debts, contracts, agreements, relating both to real and personal property, are assignable, and the assignment thereof will pass to the assignee a right of action in the name of such assignee against all parties liable to an action. Assignment carries with it all collateral securities held by the assignor for the collection of a debt or the fulfillment of a contract, and is subject to all the equities and charges which attached in the hands of the assignor. A personal trust, as the right of a master in his indentured apprentice, or the duties of a testamentary guardian, or the office of executor, trustee, etc., is not assignable. The validity of an assignment must be determined by the law of the State in which it was made, provided the thing assigned is subject of municipal or State law; but copyrights, patents, and government claims are governed by acts of Congress. In general, assignments should be recorded in the office prescribed by law, or are void as against those claiming under subsequent assignments. See **BANKRUPTCY LAWS**.

Assimilation, a term denoting the transformation of foods into living substance. The animal body is constantly changing. New compounds are being made from others; old products are cast off. There is a constant interchange of materials, some building up, others breaking down. Assimilation is one of the processes contributing to the building up or anabolic changes in the bioplasm of the animal body. The balance of nutrition is determined by the incomings and the outgoings of the human metabolism. The chief factors in the assimilative process are the foods and the oxygen in the air. For a discussion of the former, see **DIGESTION**; **NUTRITION**; for the latter, see **RESPIRATION**. See also **METABOLISM**.

Assiniboia, ăs-sin'ī-boi'a, a district in northwestern Canada, west of Manitoba, having the district of Saskatchewan on the north, and Alberta on the west. Its area is 90,340 square miles. It is intersected by the Saskatchewan, Assiniboine, and Qu'Appelle rivers, and some coal is mined within its borders. Its capital, Regina, is on the Canadian P. Ry., which intersects the district. Pop. (1901) 67,385.

Assiniboin, ăs-sin'ī-boin, the name of a tribe of Indians of Siouxian stock, numbering about 2,670 persons, of whom some 1,300 are living in Montana and the remainder in Canada.

Assin'iboine, a river of Canada, which flows through Manitoba and joins the Red River at Winnipeg, about 40 miles above the entrance of the latter into Lake Winnipeg. It has a somewhat circuitous course of about 500 miles from the west and northwest and steamers ply on it for over 300 miles.

Assisi, as-sē'sē, a hill town in Italy, in the province of Umbria, 20 miles from Spoleto. It is the see of a bishop and is famous as the birth-place of St. Francis d'Assisi, and for the splendid church built over the chapel where St. Francis received his first impulse to devotion. This church is one of the finest remains of the architecture of the Middle Ages in the Gothic style. Pop. (1901) 17,378. See "Assisi" in 'Mediaeval Towns Series' (1901); Cruikshank, 'The Umbrian Towns' (1901).

Assize of Jerusalem, a code of laws in force in the Christian kingdom of Jerusalem and Cyprus. It consisted of two parts, the assize of the high court with jurisdiction over the nobles, and the assize of the court of burgesses, or code of the common people. It was supposed for some time that the laws were framed by Godfrey de Bouillon; but this is now known to be incorrect. The assize of the high court was first framed as a code about 1255, the assize of the court of Burgesses, in the latter part of the 12th century, but the exact date is uncertain.

Assizes, an English legal term signifying the sessions of the courts held at intervals in every country by the judges. The whole country is divided into circuits, and three times in the year two judges, who are members of the highest courts in England, hold assizes in all the counties of their respective circuit. In London and Middlesex, instead of circuits, what are known as courts of *ni prius* are held. At the assizes all the justices of the peace of the county are bound to attend, or else are liable to a fine; and also all the persons who have been summoned as grand jurymen or petit jurymen by the sheriff. At these assizes the judges sit under five separate commissions, some of which relate to civil and some to criminal causes or business. In this manner, and by these means, the jails are in general cleared, and offenders tried and convicted or acquitted at least every half year. In America there are no courts or sessions of courts technically called assizes. The judges, however, perform the same duties in the counties, within their respective circuits and jurisdictions, as the English judges, and generally in the same manner, that is to say, according to the course of the common law. Since 1808 there have been assize courts in the judicial system in France. With the English institutions, however, they have scarcely anything in common but the name. In the law of Scotland assize is the technical term applied in cases tried in the court of justiciary to the jury of 15 sworn men, selected by ballot from a greater number not exceeding 45.

Associated Press. See PRESS ASSOCIATIONS.

Association Areas. In the brain of many lower animals as well as in that of man there are definite areas associated with other areas by sets of fibres, known as association fibres.

These different areas act together in performing many of the complicated acts of human life. Thus, the general sensory area in the brain, that feels the skin sensations and determines their character, is in close association with the motor area determining the movements of the body in correspondence with the knowledge given by the sensory areas. Under the heading APHASIA several of these association areas are discussed. The studies of psychology and of mental diseases are largely concerned with the relations and connections of the association areas in the brain.

Bibliography.—Flechsig, 'Die Gehirn und Seele' (1896); Barker, 'Journal of Nervous and Mental Disease,' 1897, pp. 326-356.

Association Fibres, a term applied to those fibres that connect different parts of the brain, particularly those that unite different areas in the same hemisphere, distinguishing them from the commissural fibres that connect areas in different hemispheres, or projection fibres that bind the cerebrum with the lower cerebellar or spinal systems. These association fibres form late in childhood and on their development depends much of the increased intellectual growth of the individual.

Association of Ideas, a phrase current in philosophy and psychology since the days of John Locke. The term "association" has had, in this connection, many different meanings. In popular psychology, it indicates the way the mind passes from idea to idea; or the way one idea suggests or "reproduces" another. Thus, in passing from the thought of gold to the recollection of a recent visit to a mining camp and then to the plot of a novel laid in a mountainous region, one may be said to "associate" the story with the idea of the mining camp, and this, in turn, with the idea of gold. (See MEMORY.) It is but a step from this popular conception of association—association as "reproduction"—to the notion that association is an explanation of reproduction. Association then becomes (to change the figure) not the actual passage from idea to idea, but the intangible bond which holds ideas together and which enables one idea (that is, the "gold" idea) to drag after it another (the "camp" idea). This second interpretation of the term is in disrepute among psychologists because no evidence of such a bond as the interpretation implies is to be found in consciousness. It may be urged, however, that even if association in this causal sense be undiscoverable by introspection it may, nevertheless, be regarded as a general principle of mental activity;—as the means by which the mind creates knowledge. When, however, association is thus interpreted to mean a principle underlying and conditioning the process of knowing it passes from psychology to epistemology. (See PSYCHOLOGY.) The doctrine of Associationism, which is connected with the names of David Hume, James Mill, Alexander Bain and other "associationists," rests upon this epistemological meaning of the term.

Returning to the psychological use of the word "association," we may note that the popular conception stands in need of modification and precision. (1) To say that mind "associates" idea with idea implies that ideas are by nature

separate and distinct and require some "gentle force" (as Hume puts it) to bring them together. This is not true. Ideas are interwoven; they are organically connected; they are not held together as in a bundle. (2) In the second place, the popular use of the term is too narrow; a chain of actions, or of emotions, or of feelings, may be associated as well as a chain of ideas. In habitual performances, for example,—such as dressing—one act calls forth the next, this in turn the next, and so on; or emotion may be linked with emotion, as anger following fear; or, finally, associations may set out from a perception, as the thought of home from the sight of a letter. (3) Again, association does not necessarily imply a sequence of associated elements. It may be simultaneous, as well as successive; for example, I see the table before me and, at the same time, I apprehend it as a hard resisting substance, or I hear the rumble of a carriage behind me and I see, in my "mind's eye," its form and color. (See PERCEPTION.)

(4) Finally, association in the popular sense simply states that idea follows idea; it tells us nothing of the nature of the associated consciousness; of how, that is, an association differs from a perception. Now association, in its strict technical sense, means the associated elements of consciousness; to illustrate, it means the mass of constantly shifting processes which make up mind while one is thinking gold—mining—camp—novel. Just as there exist typical groups of mental processes which underlie the perception of a landscape, a swinging pendulum or a musical composition, there exist other typical groups—such as those already mentioned—which are known as associations.

Psychological work upon association has been directed, for the most part, upon the conditions under which associative groups arise. These conditions have, since the days of Aristotle, been set down under the heading of "principles" or "laws" of association. Thus *a* is said to call up or reproduce *b* when *a* and *b* have, at some previous time, stood together in consciousness (law of contiguity), or when *a* has been the cause of *b* (law of causality), or when *a* resembles *b* (law of similarity), etc. At the present time, these "laws" of association are usually reduced to two; the law of contiguity and the law of similarity. But even these are by no means final or adequate statements of the conditions under which associations arise; for—to point to only two or three of their imperfections—"similarity" is an extremely ambiguous term; it may mean simple likeness, or partial identity, or likeness of relationship; and "contiguity" is indefinite—it does not determine how near processes must lie in consciousness in order for one to reproduce the other. Moreover, it should be said that there are thousands of contiguity and similarity connections that are never realized in association; this follows from the fact that almost everything is, to some extent, similar to everything else, and that the elementary processes of mind have appeared "contiguously" in almost every conceivable form of combination. Both terms are, then, too broad to have much significance. If we set them down as "laws," we have still to determine under what particular conditions a given association is formed. Many of these particular and more important conditions have been determined; they include recency, frequency, vividness (the more recently

or frequently or vividly a process or group of processes has stood in consciousness the greater the liability of its appearing in an associative connection), the general interests of the individual mind (for example, botanical ideas crop up in the botanist's mind, geological ideas in the mind of the geologist), the presence or absence of inhibitory associations (if *a* has already stood associated with *b* and *c*, its chances for associating with *d* will be lessened), mood (unpleasant subjects crowd into mind when one is depressed), etc. The actual liability of a given association being formed is thus seen to rest upon a great number of possible conditions. So far as there is any truth in a general all-inclusive "law" of association it is best expressed as a law of neural habit. This law is formulated by W. James as follows: "when two elementary brain-processes have been active together or in immediate succession, one of them, on reoccurring, tends to propagate its excitement into the other." The relation of this law to the law of contiguity is obvious.

I. M. BENTLEY,
Assistant Professor of Psychology, Cornell University.

Association for the Protection of the Adirondacks, a society organized in 1902 and incorporated the same year for the purpose of preserving the forests, waters, game, and fish, and to maintain healthful conditions in the Adirondack region.

Assollant, as'sō'lān', Alfred, a French novelist and political writer; b. Aubusson, 20 March 1827; d. Paris, March 1880. Having traveled extensively over the United States, he published, on his return, 'Scenes from Life in the United States' (1858), a series of tales which attracted a good deal of attention. Among his numerous novels are 'Two Friends in 1792' (1859), a story of the Reign of Terror; 'Brancas' (1859), a picture of the corruption under Louis Philippe; 'Gabrielle de Chênevert' (1865), portraying the provincial nobility before the Revolution; 'Pendragon' (1881), and 'Plantagenet' (1885).

Assommoir, L', la'sō'mwār', a novel by Emile Zola, entitled 'Gervaise' in the English translation, published in 1877. It forms one of the series dealing with the fortunes of the Rougon-Macquart family, and is a series of repulsive pictures unrelieved by one gleam of a nobler humanity, but only "realistic" as scraps: the life as a possible whole is as purely imaginative as if it were lovely instead of loathsome.

As'sonance, in poetry, a term used when the lines end with the same vowel-sound, but make no proper rhyme. Such verses having what we should consider false rhymes are regularly employed in Spanish poetry; as in *ligeras*, *cubierta*, *tierra*, *mesa*.

Assos, ās'ōs, an ancient Hellenic port on the Gulf of Edremid, from whose still imposing remains the successful excavations, in 1881-3, of the American Institute of Archaeology have brought to light the agora, with senate house and colonnade, a bath, theatre, gymnasium, statues of heroes, and seven Christian churches.

ASSOUAN

Assouan, a-swān', or Assuan, also called Eswan (Arabic *al suaan*, "the opening," that is, of the Nile; the ancient Syene, whence the red granite of the vicinity—from whose famous quarries were cut under the earliest dynasties so many of the huge obelisks and colossal statues that adorned the temples and palaces of Egypt—is called syenite), the southernmost city of Egypt proper, near Nubia, on the right or eastern bank of the Nile, and beside the first or lowest cataract. Near it are the islands of Philæ and Elephantine, the ruined monuments of the former of which are of such fascination to tourists; on the left bank are many rock tombs of the ancient dynasties. It is a garrison town, the central depot for the Sudan caravan trade, and the terminus of a railway to Alexandria which enhances its prosperity. Of still greater importance is the new dam which will add several hundred square miles outright to the arable soil of Egypt, besides steadying the fertility of the older lands, and which is described *in extenso* below. Pop. about 10,000, including the suburbs.

The monumental dam at Assouan, by far the greatest achievement of the kind in ancient or modern times, forms a reservoir in the Nile valley capable of storing 1,000,000,000 tons of water. It will not only produce a revolution in the primitive and laborious methods of irrigation in Egypt, but will reclaim vast areas of land that have hitherto been accounted as arid and worthless. The old system of irrigation was little more than a high Nile flooding of different areas of land or basins surrounded by embankments. Less than a hundred years ago, the introduction of perennial irrigation was first attempted by cutting deep canals to convey the water to the lands when the Nile was at its low summer level. When the Nile rose, these canals had to be blocked by temporary earthen dams, or the current would have wrought destruction. As a result, they silted up, and had to be cleared of many millions of tons of mud each year by enforced labor, much misery and extortion resulting therefrom. About half a century ago the first serious attempt to improve matters was made by the construction of the celebrated Barrage at the apex of the delta. This work consists, in effect, of two brick-arched viaducts crossing the Rosetta and Damietta, branches of the Nile, having together 132 arches of 16 feet 4 inches span, which were entirely closed by iron sluices during the summer months, thus heading up the water some 15 feet and throwing it at a high level into the six main irrigation canals below Cairo. In the summer months the whole flow of the Nile is arrested and thrown into the aforesaid canals. The old Barrage was constructed under great difficulties by French engineers, subject to the passing whims of their Oriental chiefs. About 15 years elapsed between the commencement of the work and the closing of all the sluices, and another 20 years before the structure was sufficiently strengthened by British engineers to fulfil the duties for which it was originally designed. Forced labor was largely employed in its construction, and at one time 12,000 soldiers, 3,000 marines, 2,000 laborers, and 1,000 masons were at work at the old Barrage.

In connection with the Nile reservoir, subsidiary weirs were constructed below the old Barrage to reduce the stress on that structure.

The system adopted was a novel one, devised by Major Brown, inspector-general of irrigation in lower Egypt. His aim was to dispense almost entirely with plant and skilled labor; and so, without attempting to dry the bed of the river, he made solid masonry blocks under water by grouting rubble dropped by natives into a movable timber caisson. Both branches of the Nile were thus dammed in three seasons, at a cost, including navigation locks, of about \$2,500,000. Many other subsidiary works have been and will be constructed, including regulators, such as that on the Bahr Yūsuf canal. The most important of the works is the Barrage across the Nile at Assiout, about 250 miles above Cairo, which was commenced by Sir John Aird & Co. in the winter of 1898 and completed in 1902. The great dam at Assouan, 850 miles above Cairo, is not a solid wall, but is pierced with sluice openings of sufficient area for the flood discharge of the river, which may amount to 15,000 tons of water per second. There are 180 such openings, mostly 23 feet high by 6 feet 6 inches wide; and where subject to heavy pressure when being moved they are of the well-known Stoney roller pattern. The total length of the dam is about 1¼ miles; the maximum height from foundation, about 130 feet; the difference of level water above and below, 67 feet; and the total weight of masonry over 1,000,000 tons. Navigation is provided for by a "ladder" of four locks, each 260 feet long by 32 feet wide. As was the case at Assiout, the difficulties in dam construction are not in design, but in the carrying out of the works. When the "rotten rock" in the bed was discovered, Sir Benjamin Baker reported to Lord Cromer frankly that he could not say what the extra cost or time involved by this and other unforeseen conditions would be, and that all that could be said was that, however bad the conditions, the job could be done. Lord Cromer replied that the dam had to be completed whatever the time and cost involved. The contract was let to Sir John Aird & Co., of London, with Messrs. Ransomes and Rapier, of London, as sub-contractors for the steel work, in February 1898. Two months after signing the contract the permanent works were commenced, and before the end of the year thousands of native laborers and hundreds of Italian granite masons were hard at work. On 12 Feb. 1899, the foundation stone of the dam was laid by the Duke of Connaught. Many plans were considered by the engineers and contractors for putting in the foundations of the dam across the roaring cataract channels, and it was finally decided to form temporary rubble dams across three of the channels below the site of the great dam, so as to break the force of the torrent and get a pond of comparatively still water up stream to work in. Stones of from 1 ton to 12 tons in weight were tipped into the cataract, till finally a rubble mound appeared above the surface. The first channel was successfully closed on 17 May 1899, the depth being about 30 feet and the velocity of current nearly 15 miles an hour. In the case of another channel the closing had to be helped by tipping in railway cars themselves, loaded with heavy stones and bound together with wire ropes, making a mass of about 50 tons, the great mass being necessary to resist displacement by the torrent.

ASSUMPSIT—ASSUMPTION

These rubble dams were well tested when the high Nile ran over them; and on work being resumed in November, after the fall of the river, water-tight sandbag dams, or "sudds," were made around the site of the dam foundation in the still waters above the rubble dams, and pumps were fixed to lay dry the bed of the river. This was the most exciting time in this stage of the operations, for no one could predict whether it would be possible to dry the bed, or whether the water would not pour through the fissured rock in overwhelming volume. Twenty-four 12-inch centrifugal pumps were provided to deal, if necessary, with one small channel; but happily the sandbags and gravel and sand embankments stanching the fissures in the rock and interstices between the great boulders covering the bottom of this channel, and a couple of 12-inch pumps sufficed. The masonry of the dam is of local granite, set in British Portland cement mortar. The interior is of rubble set by hand, with about 40 per cent of the bulk in cement mortar, four of sand to one of cement. All the face work is of coursed rock-faced ashlar, except the sluice linings, which are finely dressed. This was steam crane and Italian masons' work. There was a great pressure at times to get a section completed before the inevitable rise of the Nile, and as much as 3,600 tons of masonry was executed per day, chiefly at one point in the dam. A triple line of railway and numerous cars and locomotives were provided to convey the materials from quarries and stores to every part of the work. The maximum number of men employed was 11,000, of whom 1,000 were European masons and other skilled men. Mr. Wilfred Stokes, chief engineer and managing director of Messrs. Ransomes and Rapier, was responsible for the detailed designing and manufacture of the sluices and lock gates; 140 of the sluices are 23 feet high by 6 feet 6 inches wide, and 40 of them half that height; 130 of the sluices are on the "Stoney" principle with rollers, and the remainder move on sliding surfaces. The larger of the Stoney sluices weigh 14 tons, and are capable of being moved by hand under a head of water producing a pressure of 450 tons against the sluice. There are five lock gates, 32 feet wide, and varying in height up to 60 feet. They are of an entirely different type from ordinary folding lock gates, being hung from the top on rollers, and moving like a sliding coach-house door. This arrangement was adopted for safety, as 1,000,000,000 tons of water are stored up above the lock gates, and each of the two upper gates is made strong enough to hold up the water, assuming that the four other gates were destroyed. When the river is rising the sluices will all be open, and the red water will pass freely through, without depositing the fertilizing silt. After the flood when the water has become clear, and the discharge of the Nile has fallen to about 2,000 tons per second, the gates without rollers will be closed, and then some of those with rollers; so that between December and March the reservoir will be gradually filled. The reopening of the sluices will take place between May and July, according to the state of the Nile and the requirements of the crops. Between December and May, when the reservoir is full, the island of Philæ will in places be slightly flooded. As the temples are founded partly on

loose silt and sand, the saturation of the hitherto dry soil would cause settlement, and no doubt injury to the ruins. To obviate this risk, all the important parts, including the well-known Kiosk, or "Pharaoh's bed," have been either carried on steel girders or underpinned down to rock; or failing that, to the present saturation level. It need hardly be said that having regard to the shattered condition of the columns and entablatures, the friability of the stone, and the running sand foundation, the process of underpinning was an exceptionally difficult and anxious task. It is impossible to estimate the far-reaching beneficial influence these irrigation works will bestow upon Egypt; but the reclamation of so many thousands of acres of desert for agricultural development cannot fail to improve the agricultural possibilities of the land, and assist Egypt to regain the prosperity it enjoyed in the era of the Pharaohs, with a greater cultivable area than it had even then. See IRRIGATION; NILE.

Assump'sit, in law, an action to recover a compensation in damages for non-performance of a simple contract; that is, a promise, whether verbal or written, not contained in a deed under seal. The word *assumpsit* (Latin) means, he undertook, and was taken as the name of this action from its occurrence in declarations, that is, formal statements of the plaintiff's cause of action, when these were in Latin. Assumpsits were of two kinds, *express* and *implied*, the former being where the contracts were actually made in word or writing; the latter being such as the law implies from the justice of the case; as, for instance, if I employ a workman to do any work for me, the obvious justice of my paying him a reasonable sum for that work, when done, raises an implication, in the understanding of the law, of a promise on my part to pay him.

Assump'tion, a city in Paraguay. See ASUNCION.

Assump'tion, a Church festival celebrating the translation into heaven of the Virgin Mary, kept on 15 August. The legend first appeared in the 3d or 4th century, and the festival was instituted some three centuries later. The story has been made the subject of a number of paintings by the most celebrated artists in history. The following are the best known: (1) Titian: in the Accademia in Venice, represents the Virgin being carried on bright clouds to heaven, surrounded by rejoicing angels, while the apostles look up from earth in amazement; (2) Titian: another painting in the Cathedral of Verona; (3) Correggio: frescoes in the cupola of the cathedral in Parma, Italy; (4) Rubens: painting in the cathedral at Antwerp, Belgium; representing the Virgin being carried to heaven, surrounded by angels, while several apostles and women are gathered at the empty tomb below; (5) Perugino: in the Accademia, in Florence; showing, in addition to the Virgin, four saints in the foreground; the representation of the Virgin is considered one of Perugino's most beautiful figures; (6) Guido Reni: a large canvas in Bridgewater House, in London; (7) Gaudenzio Ferrari: fresco in the Church of San Cristoforo, in Vercelli, Italy; showing figures of the Father, the Virgin, the angels, and the apostles; (8) Murillo: painting in the Hermitage Museum, St. Petersburg; representing the Virgin floating

ASSOUAN DAM.

Bird's-eye View of the Structure and Surrounding Region.

ASSURANCE — ASSYRIA

upward on clouds, with bands of cherubs above and below her; considered a typical display of the painter's qualities of grace and expression; (9) Guercino: a painting, also in the Hermitage Museum; showing the Virgin, with uplifted face, being borne upward on a cloud, with angel attendants, and the apostles standing about her empty tomb. 'The Assumption of Moses' is the title of an apocryphal book, giving an account of the reception of Moses in heaven, written probably 20 A.D.

As'sus. See **ASSOS**.

Assynt, äs'int, a wild and rugged district of Scotland. Some of its mountains are of considerable elevation, and the loftiest, Ben More, rises to the height of 3,230 feet. There are inexhaustible quarries of marble, both white and variegated. Fresh-water lakes are numerous; the largest, Loch Assynt, is about seven miles in length and one in breadth.

Assyr'ia (the *Asshur* of the Hebrews, *Athura* of the ancient Persians), the ancient name of a portion of Mesopotamia, lying mainly between the Euphrates and the Tigris, the seat of the earliest recorded monarchy. In the earliest times it was probably limited to the low-lying tract between the Jebel Makloub and the little Zab (Zab-Asfal), on the left bank of the Tigris; but at its greatest extent Assyria must have been nearly 500 miles long, with an area of about 100,000 square miles. Toward the north Assyria bordered on the mountainous country of Armenia, which may at times have been under Assyrian dominion, but which at no time was considered as an actual part of the country. On the east dwelt numerous independent and warlike tribes, sheltered by the fastnesses of the Zagros Mountains. On the south Susiana or Elam was the frontier state east of the Tigris, while Babylonia occupied the same position between the rivers. West of Assyria lay Arabia, and higher up Syria and the land of the Hittites. The chief cities of Assyria in the days of its greatest prosperity were Nineveh, whose site is marked by the mounds opposite Mosul (Nebi Yunus and Koyunjik), Calah or Kalakh (the modern Nimrud), Asshur or Al Asur (Kalash Sherghat), Sargina, Khorsabad), Arbela (Arbil), etc. The surface of the country within its widest limits was of a diversified character. On the north and east the lofty mountain-ranges of Armenia and Kurdistan are succeeded by low ranges of arid limestone hills, occasionally enclosing fertile plains and valleys. Immediately south of this is a well-watered, productive, and undulating belt of country, into which run limestone rocks of a golden color, and wooded with dwarf-oak. This sinks suddenly down upon the great Mesopotamian plain (the modern El Jezireh), about 250 miles in length, interrupted only by a single limestone range rising suddenly out of the plain and branching off from the Zagros Mountains. The numerous remains of ancient habitations show how thickly this vast flat must have once been peopled; now, for the most part, it is a mere wilderness.

History.—Scripture tells us that the early inhabitants of Assyria went from Babylon, and

the traditions of later times, as well as inscriptions on the disinterred Assyrian monuments, and the character of those remains, go to show that the power and civilization of Babylon were earlier than those of Assyria. In Genesis x. 11 it is mentioned that Nineveh was founded by Asshur, but for long the country was subject to governors appointed by the kings of Babylon. We learn from monumental inscriptions that about 1820 B.C., when Asshur was the capital of the country, Samsi-vul founded temples there to Asshur, the great national deity, and to Anu and Vul, besides a temple to the goddess of Nineveh in the city of that name. The Assyrian rulers gradually began to treat with their southern neighbors on equal terms, the boundaries of the two countries were for a time clearly marked out, and intermarriages among the reigning families occasionally took place. About the latter end of the 14th century Shalmaneser acquired the whole of Naharain (the country round the sources of the Euphrates and Tigris) by conquest, and planted Assyrian colonies there; he also founded the city of Kalakh or Calah, and restored the great temple at Nineveh. About 1300 B.C. he was succeeded by his son Tiglath-ninip, who conquered the whole of the valley of the Euphrates, and built or restored the palace at Asshur. The five following reigns were occupied with wars, more or less successful, with the Babylonians. About the year 1120 B.C. Tiglath-Pileser I., one of the most eminent of the sovereigns of the first Assyrian monarchy, ascended the throne, beginning his reign by the conquest of the Syrians and Hittites in the west. He then carried his arms far and wide, subjugating the Moschians, Commagenians, Urumians, and other tribes in the north; on the south he shattered the Babylonian power, and captured their capital. But this empire, acquired and ruled by the energy and genius of one man, began to fall to pieces at his death (1100). The period of decline lasted over 200 years, during which time little is known of Assyrian history. Under Assur-nazir-pal, who reigned from 884 to 859 B.C., Assyria once more advanced to the position of the leading power in the world. The extent of his kingdom was greater than that of Tiglath-Pileser, and the magnificent palaces, temples, and other buildings erected during his reign, with their elaborate sculptures and paintings, prove that wealth, art, and luxury must have reached a high stage of development. When he ascended the throne Nineveh was the capital of the kingdom, but he restored and beautified Calah, which had suffered during the troubled and declining years of the country, made it his favorite residence, and raised it to the dignity of the chief city of the state. Among the first acts of his reign was the suppression of a revolt by the Assyrian colonists of Naharain (883). This was followed by the victorious campaigns in Zamua on the eastern frontier (882-881), against several rebellious provinces in the northwest (880), and against the Shukhi or Shuhites, who then occupied a tract of country between Babylon and Assyria (879). In another expedition he crossed the Euphrates and advanced to the Mediterranean, near the mouth of the Orontes. In 859 Assur-nazir-pal was succeeded by his son Shalmaneser II., whose career of conquest was equally successful. The closing years of his reign were troubled by the re-

ASSYRIA

bellion of his eldest son, Assur-dain-pal, who had gained over to his side the cities of Nineveh, Assur, Arbela, and other important towns. After much fighting the rebellion was put down by Shalmaneser's second son Samsi-vul (Samas-Rimmon), who succeeded to the throne in 824. The old dynasty came to an end in the person of Assurnirai II., who was driven from the throne by a usurper, Tiglath-Pileser, in 745, after a struggle of some years. No sooner was this able ruler firmly seated on the throne than he made an expedition into Babylonia, followed by another to the east in 744. In the following year an alliance was formed against Assyria between Sarduri, king of Armenia, and several neighboring princes, and the Syrians came to their assistance at Arpad, on the Euphrates. Here they were defeated with great slaughter by Tiglath-Pileser, and the Armenian king was chased to the gates of his capital, Turuspa. The conqueror now advanced against Syria, overthrew the ancient kingdoms of Damascus and Hamath, and placed his vassal Hosea on the throne of Samaria. A protracted campaign in Media (737-735), another in Armenia, and the memorable expedition into Syria mentioned in 2 Kings xvi., are among the most important events of the latter years of his reign. Tiglath-Pileser was one of the greatest of the Assyrians; he carried the Assyrian arms from Lake Van on the north to the Persian Gulf on the south, and from the confines of India on the east to the Nile on the west. Yet he was not able to keep his seat on the throne, being driven from it by another claimant named Shalmaneser (727). Little is known of the five years' reign of this prince. He blockaded Tyre for five years, and on the revolt of Hosea, king of Israel, in league with Sabako, king of Egypt, he invaded Israel and besieged Samaria, but died before the city was reduced. His successor Sargon (722-705) claimed descent from the ancient Assyrian kings. At the very opening of his reign, after taking Samaria and leading over 18,000 people captive, he overthrew the combined forces of Elam (Susiana) and Babylon. In 719 Sargon turned his arms against the revolted Armenians, and in 717 he besieged and took the rich trading city of Carchemesh, which had also risen against his authority; here an immense spoil fell into his hands. In 716 the Armenians and several tributary princes in the north again took up arms for independence, but the Assyrians having again triumphed the Armenian king committed suicide and the other princes submitted. The attitude of Babylonia now began to look extremely dangerous. Merodach-Baladan, a Chaldean leader, taking advantage of the troubles which closed the reign of Tiglath-Pileser, had possessed himself of Babylonia, and held it for 12 years, strengthening himself by alliances with Egypt and the various rulers of Palestine. In 710 Merodach-Baladan was driven out of Babylonia; in a single campaign the allies were crushed, Judah was overrun, and Ashdod leveled to the ground. Sargon spent the latter years of his reign in internal reforms, and in founding or beautifying several cities of his kingdom. A new city, called Dur-Sargina, was founded to the north of Nineveh, the library of Calah was restored and enlarged, and special attention was devoted to law reform. In the midst of these labors Sargon was murdered,

and was succeeded by Sennacherib, one of his younger sons, in 705.

No sooner was Sennacherib seated on the throne than he was compelled to take up arms against Merodach-Baladan, who had again obtained possession of Babylon. In 701 fresh outbreaks in Syria led him in that direction. He first swept down on Zidon, drove the king into Cyprus, and seated Tubal on his empty throne. Next he deposed Zidqa of Askalon, and advanced against Ekron and Judah. The people of Ekron had dethroned Padi their king, and gave him into the hands of Hezekiah, king of Judah. The Egyptian and Ethiopian forces advanced to the assistance of their Judean allies, but Sennacherib totally routed the confederates at Altaqa in Judah, which he rapidly overran, taking 46 of its fortified cities. Hezekiah now submitted, agreeing to pay the conqueror a sum of 30 talents of gold and 800 talents of silver. Padi was given up and restored to Ekron, and after Sennacherib had chastised the rebels he returned to Assyria. The threatening aspect of affairs in Babylonia and Elam again called his attention to the south in 700, and in 699 he advanced to the northern boundaries of his kingdom to quell the insurrections which had broken out among the hill tribes. His second expedition into Syria is one of the most memorable in the history of Assyria, and is briefly recorded in 2 Kings xix. But his career of conquest was stopped by an appalling catastrophe: his army lay before Libna, when in one night "the angel of Jehovah went out and smote in the camp of the Assyrians 185,000 men" (2 Kings xix. 35). Sennacherib himself returned to Assyria, and occupied the last years of his reign in repressing the outbreaks of the Babylonians and Elamites, in constructing canals and aqueducts, and in entirely rebuilding Nineveh. In 681 he was murdered by his two sons, Adrammelech and Sharezer, but they soon found themselves confronted by a veteran army under Esarhaddon, their father's younger and favorite son, who defeated them in a battle at Kanirabbat, and assumed the crown (680).

Esarhaddon fixed his residence at Babylon, where he governed in person during the whole of his reign. The most important event of this reign was the conquest of Egypt, which left Assyria the mistress of the world. In 672 Esarhaddon led his forces into Egypt, drove out Tirhakah, its Ethiopian ruler, and divided the land into 20 separate kingdoms, the rulers of which were his vassals. Feeling unable to cope in person with his rebellious tributaries, Esarhaddon associated his son Assurbani-pal with him in the government of the kingdom (669), dying two years later. But constant wars were beginning to exhaust the men and treasure of the empire; and luxury, which had flowed suddenly in like a flood, was enervating the people. The king now no longer appeared at the head of his army, but intrusted it to generals, and abandoned himself to indolence and sensuality. Assurbani-pal was a zealous patron of the arts; learned men from all countries were welcomed to his court; literary works were collected from all sources; the library of Nineveh was greatly augmented; the study of the dead language of Accad was encouraged, and dictionaries and grammars were compiled. The buildings were unrivalled for magnificence, his palace glittering with gold

ASSYRIA

and silver, and adorned with the rarest sculptures. Unfortunately the king's character was marked by cruelty and sensuality, and his example descended through the court to the people. He died in 625, and was succeeded by his son Assurebilili-kain, under whom Babylon definitely threw off the Assyrian yoke. The country continued rapidly to decline, fighting hard for mere existence until, under its last king Sarcus, Nineveh was captured and burned by the allied forces of the Medes and Babylonians in 606 B.C.

Ethnology, Language, Religion, etc.—The original inhabitants of Assyria and Babylonia belonged to that race variously called Turanian, Ural-Altaic, Scythian, or Tatar, and which appears at one time to have occupied the entire region from the Caucasus to the Indian Ocean, and from the Mediterranean to the delta of the Ganges. The ancient Assyrians, therefore, were of the same stock as that from which the Finns, Turks, and Magyars have descended; and their language, which has been preserved to us in inscriptions, and is known by the name of Accadian, is allied to the Ugro-Bulgaric division of the Finnic group of languages. The Akkadai or Accad race descended from the mountainous region of Elam on the east, and the origin of Chaldean civilization and writing was due to them. In course of time, however, a Semitic race of people spread themselves over the country, and mingled with or supplanted the original inhabitants, while their language took the place of the Accadian, the latter becoming a dead language. Belonging to the Semitic family, these later Assyrians were thus members of the same great division of the human race as the Hebrews, Syrians, Phœnicians, and modern Arabians. The language differed little from the Babylonian, which was characterized by a preference for the softer sounds and a fuller use of the vowels. Both languages retained traces of the influence of the earlier Accadian. Assyrian is closely allied to Hebrew and Phœnician; it has their peculiarities of phonology, vocabulary, and grammar, and some obscure points in Hebrew etymology have been cleared up by its aid. The language changed little throughout the 1,500 years during which we can trace its career in the recently deciphered inscriptions. It continued to be written with the cuneiform character down to the 3d century B.C. Assyria could boast of but little native literature; it was a land of warriors, and the peaceful arts had their home in Babylonia. It was not until the time of Assur-bani-pal that any attempt was made to rival Babylon in learning. Their original works were for the first time composed, and treaties were composed even, in the dead Accad language. The greater part of the literature was stamped in minute characters on baked bricks, but papyrus was also used, although no books in this form have come down to us. The subjects of the Assyrian literature comprise hymns to the gods, mythological and epic poems, and works on history, chronology, astrology, law, etc. (See BABYLONIAN LITERATURE.) The Assyrian religion, like the language and arts, was in most essential points derived from Babylonia. There were the same gods, the same ceremonials and prayers, and even the temples had the same names. There is, however, in one point a notable difference. In addition to the worship of the Babylonian deities the Assyrians adored their national deity Assur, plac-

ing him at the head of the Pantheon. He was called king of all the chief gods, the god who created himself, it being supposed that he was self-existent and the creator of all things. After Assur come the 12 chief deities, Anu, god of heaven, ruler of angels and spirits; Bel, the father of the gods; Hea, king of the sea; Sin, or the Moon, lord of crowns; Shamas, or the Sun, judge of heaven and earth; Ninip, god of hunting; Nergal, god of war; Nusku, bestower of sceptres; Beltis, mother of the gods; Ishtar, leader of heaven and earth; and Bel, or Mero-dach, lord of Babylon. Most of those divinities had consorts, who were not, however, admitted to the first rank of the gods. Below this first rank were a number of spirits, good and evil, who presided over the minor operations of nature. There were set forms regulating the worship of all the gods and spirits, and prayers to each were inscribed on clay tablets with blanks for the names of the persons using them.

Art and Science, etc.—Although in art, as in other things, Assyria was the pupil of Babylon, there was yet a notable difference between its development in the two countries, due partly to two causes. The alabaster quarries scattered over the country supplied the Assyrians with a material unknown to their southern neighbors, on which they could represent, far better than the Babylonians on their enamelled bricks, the scenes which interested them. Sculpture was naturally developed by the one, just as painting was by the other, and the ornamentation which could be lavished on the exterior of buildings in Assyria had to be confined to the interior in Babylonia. The Assyrian artists, faithful and indefatigable, acquired a considerable power in representing the forms of men and animals, and produced vivid and striking scenes of the chief occupations of human life. If they did not strive greatly after the ideal, and never in this direction reached a very exalted rank, yet even here their emblematic figures of the gods have a dignity and grandeur which implies the possession of some elevated feelings. But their grand merit is in the representation of the real. Their scenes of war and of the chase, and even sometimes of the more peaceful incidents of life, have a fidelity, boldness, and lifelike appearance which place them high among the realistic schools. Unlike that of the Egyptians, which remained comparatively stationary from the earliest to the latest ages, the art of the Assyrians is plainly progressive, becoming gradually more natural and less uncouth, more lifelike and less stiff, more varied and less conventional. It may be said to have reached its highest stage of development in the reign of Assur-bani-pal, when it was characterized by great chasteness and softness, delicacy and finish. The beginning of Greek art coincides with the decadence of the Assyrian, and there can be no doubt that the Hellenic artists owe much to their Assyrian predecessors. The advanced condition of the Assyrians in various other respects is sufficiently evidenced by the representations on the sculptures, and by the remains discovered among their ruined buildings. We now know that they understood and applied the arch; that they constructed tunnels, aqueducts, and drains; that they used the lever and the roller; that they engraved gems in a highly artistic way; that they understood the arts of inlaying, enamelling, and

overlaying with metals; that they manufactured porcelain, and transparent and colored glass, and were acquainted with the lens; that they possessed vases, jars, and other dishes, bronze and ivory ornaments, bells, gold earrings and bracelets of excellent design and workmanship. Their household furniture also gives us a high idea of their skill, taste, minuteness, and accuracy. The cities of Nineveh, Assur, and Arbela had each their royal observatories, superintended by astronomers-royal, who had to send in their reports to the king twice a month. At an early date the stars were numbered and named; a calendar was formed, in which the year was divided into 12 months (of 30 days each) called after the zodiacal signs, but as this division was found to be inaccurate an intercalary month was added every six years. The week was divided into seven days, the seventh being a day of rest; the day was divided into 12 *casbu* of two hours each, each *casbu* being subdivided into 60 minutes, and these again into 60 seconds. Eclipses were recorded from a very remote epoch, and their recurrence roughly determined. The principal astronomical work, called the *Illumination of Bel*, was compiled for the library of Sargon of Agane; it was inscribed on 70 tablets, and went through numerous editions, one of the latest being in the British museum. It treats, among other things, on observations of comets, the polar star, the conjunction of the sun and moon, and motions of Venus and Mars. The study of mathematics was fairly advanced, and the people who were acquainted with the sundial, the clepsydra, the pulley, and the lever must have had considerable knowledge of mechanics.

Government.—Like all the ancient monarchies which attained to any considerable extent, Assyria was composed of a number of separate kingdoms. In the East conquest has very seldom led to amalgamation, and in the primitive empires there was not even any attempt at that governmental centralization which we find at a later period in the satrapial system of Persia. The Assyrian monarchs reigned over a number of petty kings, the native rulers of the several countries, over the whole extent of their dominions. These native princes were feudatories of the Great Monarch, holding their crowns from him by the double tenure of homage and tribute. This system naturally led to the frequent outbreak of troubles. See CUNEIFORM WRITING; NINEVEH; NIPPUR.

Astarte, *as-tār'te*, Syrian goddess, probably identical with the *Semele* of the Greeks and the *Ashtaroth* of the Hebrews. According to

Lucian she had a very ancient temple in Phœnicia. She appears to have been regarded as the goddess of fruitfulness.

Astar'te, a genus of bivalve mollusks belonging to the family *Cyprinidæ*. They have 2-2 hinge teeth, and are suborbicular, compressed, thick, smooth, or concentrically furrowed shells. Tate estimated the recent species known at 20 and the fossil at 285. The former belong to the Temperate and Arctic zones, and the latter to the rocks from the carboniferous formation upward.

Astatic (*as-tat'ik*) **Needle** (Greek, "unstable," in physics, a magnetic needle whose tendency to set itself in the magnetic meridian has been nearly or quite neutralized in some way, so that while the needle retains its full magnetic power, it will remain indifferently in any position, even when quite free to turn. A magnetic needle may be made astatic in various ways; for example, by disposing magnets in the vicinity of the needle in such a way that their field of force opposes and neutralizes the earth's field. A commoner method is to make use of a pair of needles of equal size and equal magnetic strength, securing them together, one above the other, by a light, rigid connection, so that their lengths shall be parallel, and their poles turned in opposite directions. If the conditions here assumed are fulfilled rigorously, the system will have no directive tendency whatever. In practice it is quite possible to secure an adjustment so good that the directive tendency is masked by the torsional force of the suspending fibre. Astatic needles are used in the construction of delicate galvanometers, the coil conveying the current passing around only one of the needles of the system, or around both of them, in opposite directions. The full magnetic moment of the current is thus obtained, while the directive action of the earth's field remains practically zero, and the motion of the needle is opposed only by the torsion of the suspension. See GALVANOMETER.

Asten, *as'tên*, **Friedrich Emil von**, German astronomer: b. Köln, 1842; d. 1878. From 1870 he was employed at the Imperial Russian Observatory at Pulkowa. He will be best remembered for his work upon Encke's comet, the results of which were published in 1877, and included an elaborate discussion of all the appearances of this interesting body from 1819 to 1875.

Aster, *as'ter*, **Ernst Ludwig von**, German military engineer: b. Dresden, 5 Oct. 1778; d. Berlin, 10 Feb. 1855. His first service was in the Saxon army. Subsequently he entered the Russian service, and, soon after 1815, the Prussian. While in the last service he undertook the fortification of Coblenz and Ehrenbreitstein, and in 1842 was appointed general and inspector of all the Prussian fortresses.

As'ter, a genus of plants belonging to the natural order *Compositæ*, and comprehending several hundred species, mostly natives of North America although some of the species are found over most regions of the globe. The name is derived from the Greek *aster*, a star, and is due to the fact that the flowers (*capitula*) bear some resemblance to stars. The species are herbaceous plants, or more commonly

ASTERISK — ASTEROIDS

shrubs. On account of the large number of species composing this genus it is divided into six or seven groups, regarded by some botanists as forming distinct genera. Large as the genus is, it contains no species of any great utility in the arts, but many are cultivated as ornamental plants. The most beautiful species among those which are natives of Europe are the *A. alpinus*, *amellus*, and *pyreneus*, and among those of America, *A. grandiflorus*, *punicaeus*, *eminens*, *multiflorus*, *horizontalis*, *thyrsiflorus*, *roseus*, and *Novae Angliae*. The China aster (*A. chinensis*), introduced from China upward of a hundred years ago, is a well-known annual, growing to a height of from 12 to 18 inches, and bearing an abundance of large and beautiful flowers, exhibiting in the numerous varieties every hue except yellow, and a great diversity of marking. This plant lends itself readily to culture and florists are constantly adding new varieties to a stock that already numbers nearly 300. The French call this species *Reine Marguerite*. Some botanists refer it to a separate genus which they call *Callistephus*. The chrysanthemum and peony flowered varieties are particularly worthy of cultivation for the size, color, and abundance of their flowers. From the lateness of the season in which they bloom some species of aster have obtained the name in England of Christmas daisy. Of the species commonly cultivated in gardens, several bloom in July, and a few continue in flower from November until killed by frost, or the beatings of violent storms.

Asterisk ("a little star"), a sign or symbol (*) used in writing and printing, as a reference to a note at the bottom or on the margin of the page. The obelisk, or dagger (†), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, etc. The asterisk often marks the omission of words or sentences, or it distinguishes words as conjectural or obscure, or it may be used merely as a typographical mark for any specified purpose.

Asterism, a property possessed by a few minerals of exhibiting star-like rays. It is due either to reflection of light from twinning lamellæ or minute enclosed tubes, as in the case of star-sapphire (q.v.), star-ruby, and star-quartz (q.v.), or to the regular arrangement of minute enclosed crystals as seen by transmitted light, in the case of some phlogopite or starmica.

Asteroidea, an order of *echinoderms*, the starfishes, so called because of their star-like shape. They are characterized by five or more arms, which they have the power to reproduce if broken off. Should one of these arms be entirely detached, taking a small portion of the body with it, a new fish will result.

Asteroids, a group of small planetary bodies, known also as minor planets, which revolve round the sun between the orbits of Mars and Jupiter. The most remarkable feature of these bodies is that they occupy a vacant place in the solar system in which a planet would naturally belong. Between the orbit of Mars, the fourth planet in order, and that of Jupiter the fifth, there is a space more than double the radius of the orbit of Mars itself. This gap was noticed from the time that the distances of the planets

were laid down by Kepler. It was long suspected that a planet would be found occupying it and an organized effort was made to discover it. The discovery of a planet which was supposed to be the long sought body was made by Piazzi, at Palermo, on the first day of the 19th century. To the great surprise of astronomers three other planets were found in the course of the next six years to be revolving in the same region. The smallness of the four bodies gave rise to the celebrated hypothesis of Olbers, that these bodies were the fragments of a single planet which had been disrupted by some cataclysm. Some 40 years elapsed when in 1846 a fifth asteroid was discovered. Others soon followed. More powerful telescopes were applied to the search, a thorough system was introduced, and in this way the number known went on increasing until it mounted into the hundreds and now a dozen or more are frequently added to the list in a single year.

When photography was applied to form a permanent picture of the stars in the sky, it was found that this method was the easiest by which discoveries of these objects could be made. Whatever method may be used, the difficulty of discovering an asteroid arises from the fact that it is impossible to distinguish such a body from a fixed star by its mere aspect. It can be detected only by its motion among the stars, and therefore requires that the same body should be observed at different times. But a photograph enables the motion to be detected in a very simple way, as follows:

If a telescope, mounted so as to serve as a camera, is pointed at a given region of the sky for half an hour or more, the images of the stars which fall on the plate remain immovable, and these bodies are photographed as simple points of light. But if an asteroid is in the field, its motion during the exposure is quite appreciable; and its picture appears as a short line, equal in length to the amount of motion during the exposure of the plate, which can be detected at sight. During the last ten years the number thus discovered has carried the total list up to more than 600, a number so great that it is almost impossible to compute the orbits or motions or even to find separate and appropriate names for the bodies.

The asteroids are distinguished from the major planets by several distinct and interesting features. One of these concerns their orbits. While the major planets, with the exception of Mercury, all move in nearly circular orbits, the orbits of the asteroids are, in the general average markedly eccentric. In some cases the asteroid is twice as far from the sun at aphelion as at perihelion. One result of this is that they appear several times brighter when seen in opposition at perihelion than at aphelion. The inclination of the orbits is also frequently very large. That of Pallas, one of the original four, is inclined no less than 34° to the elliptic. The result of this is that many of these bodies wander far outside of the limits of the Zodiac; indeed, in many cases they are seen north of the zenith in our latitudes when nearest the earth.

The size and mass of the asteroids do not admit of very accurate definition, for the reason that, with rare exceptions, they are seen in the telescopes only as points of light. Barnard, has, however, succeeded in measuring the apparent diameter of the first four, three of which are

ASTEROLEPIS

probably the largest of the group, with the great Yerkes telescope. The results are:

	Miles
Diameter of Ceres.	485
Diameter of Pallas.	304
Diameter of Vesta.	243
Diameter of Juno.	118

Only the largest shows a diameter exceeding one twentieth that of the earth, and all the others are much smaller than this. Judging from the amount of light they reflect very few of them are 100 miles in diameter and most of those known may not exceed 10 or 12 miles in extent. Indeed, we have reason to believe that as we take smaller diameters the number increases without any unit. The same remark might apply in a still greater extent to the masses. The latter are so small that the attraction of the whole mass of all the asteroids does not produce any effect that has yet been observed upon any planet or comet.

Of the total number of these bodies it is hardly possible to form any estimate, because the more powerful the means of research the more are found. We can hardly be astray in supposing that thousands exist, and if we include those that must forever remain invisible to us, the number must be countless. Yet they are all so minute that the total mass cannot be as great as that of the planet Mercury.

The hypothesis already mentioned, that these bodies are fragments of a great planet, has been effectually disproved by modern research. Apart from the impossibility of an explosion which would rend a planet, we have the fact that in the event of a disruption all the orbits would pass through a single point. It is true that this coincidence would not continue indefinitely, because the orbits would change their positions by the attraction of the other planets; but their size is found to be such that they could not originally have passed through any single point. The view now prevalent is suggested by the nebular hypothesis, which assumes that all the planets were at some remote epoch in the past spread out into rings of matter circulating around the sun. In the case of the eight major planets each ring condensed into a single body, but in the case of the asteroid ring it separated into countless small bodies instead of condensing into one. There is a curious grouping of the orbits which seems to have some connection with the origin of the whole collection. Thirty years ago it was noticed by Kirkwood that, if the orbits were arranged according to their mean distance from the sun, there would be gaps in the series at those points where the time of revolution was commensurable with the period of Jupiter. For example, there are no known asteroids having a period one third that of Jupiter, or one half or two fifths, although there are plenty of orbits within and outside these peculiar limiting values. The subsequent discovery of hundreds of these bodies has led to a slight modification of this law. The orbits not only seem to avoid these peculiar values, but to accumulate midway between them. To get an idea of the results suppose that every orbit stretched into a circle of a radius equal to its mean distance. Then treating these orbits as hoops, suppose that we arrange them all round on one centre. We should then find that the rings are divisible into four, five or six nearly distinct groups with vacant spaces between them. The most probable explanation seems to be that there were originally

five or six different rings of matter from which these bodies condensed, instead of a single ring as in the case of the larger planets.

Perhaps the most remarkable of the asteroids was one discovered in 1898. Some of its peculiarities have excited great attention on the part of the astronomical world. The orbits of all the other known asteroids are contained between the orbits of Mars and Jupiter, no known orbits approaching very near either of these planets. But, in the summer of 1898, Witt, of Berlin, found an asteroid which at perihelion came far inside the orbit of Mars, indeed within 14,000,000 miles of the orbit of the Earth. Its orbit was found to be extremely eccentric and, which was more curious, it was interlinked with that of Mars, so that if the orbits were rings, they would have passed through each other and hung together like two links. What gives this planet especial interest is that on these rare occasions when it comes nearest to the earth its parallax can be measured with greater precision than that of any of the other planets. It therefore affords us the best possible method of directly measuring the Solar system; but, most unfortunately, it is only once or twice in a century that the nearest approach will occur. What is most tantalizing, is that only six years before it was discovered, it is known to have passed at nearly the least distance from the earth, but it was then unseen by human eye. It was found to have been photographed a great number of times at the Harvard Observatory; but among the hundreds of stars whose images were found on the plate, its image was completely lost after the discovery in 1898. It was recognized through the determination of its orbit which made possible the computation of its position in the heavens at former positions. It was by scrutinizing the photographic plates that the images were found upon them.

In the winter of 1900-1 there was as close an approach to the earth as will occur during the next 30 years, although the distance was more than double the least possible distance. A co-operative effort was made to measure the parallax on this occasion. The results are not completely worked out, owing to the immense amount of labor which is required for the reduction of the observations.

A curious property of this most remarkable body is a periodical variation in its light which was noticed during the opposition of 1900-1. It was found to go through a series of changes in the course of five hours quite similar to those of a variable star. The period was found to be $2\frac{1}{2}$ hours, but possibly the same brightness was not reproduced except in a period of 5 hours. It was yet more curious that these variations seemed to have nearly or quite ceased at the next opposition.

SIMON NEWCOMB, LL.D.

Asterolepis, a genus of ganoid fishes named on account of the starry color of its scales. A bone of a species belonging to this genus, found at Stromness, the capital of Orkney, suggested to Hugh Miller the writing of his beautiful volume entitled 'Footprints of the Creator; or, the Asterolepis of Stromness.' It was an elaborate argument against the development hypothesis. According to that hypothesis, the first species of any class appearing on the scene should be low in organization, and probably small in size. Mr. Miller showed that the asterolepis was large in size and high in organ-

ASTHENIA — ASTOR

ization, and yet it was at that time believed to be the oldest fossil vertebrate found in Scotland. His argument was subsequently weakened by the discovery that the Stromness rocks were less ancient than the Forfarshire beds, containing cephalaspis and other fish genera subsequently discovered, mostly of small size, though not of low organization.

Asterophyllites, a genus of cryptogamous plants, allied to calamites, belonging to the order *equisetaceæ*. All are fossil, and belong to the carboniferous period. Their name was given on account of the starry appearance of the verticillate foliage, and their stems were articulated and branched.

Asthe'nia, a disease of poultry, known in the United States as "going-light." The treatment is purgation and tonics.

As'theno'pia. See EYE.

Asthma, as'ma, or az'ma, a disturbance of the function of breathing, sometimes due to heart or kidney disease, but properly an affection of the bronchi of a spasmodic character. It is regarded as a neurotic affection, characterized by turgor and hyperemia of the mucous membranes of the smaller bronchi and a peculiar mucus exudate. The causes of the attacks are many, but a nervous element seems to enter into most of them. The symptoms are those of tightness in the chest, depression, and followed by an attack of shortness of breath, attended with violent coughing. This may be very short in duration or the coughing may continue with great violence. The expression is anxious, the face pale, or cyanosed, as though choking was taking place; the patient cannot speak, inspiration does not aerate the blood, and expiration is long and wheezy. An attack may finally end with violent coughing and exhaustion. Asthma is more common in men than in women. It may be present even in children, in whom the family nervous inheritance is usually pronounced. The disease is usually chronic. The treatment is individual, the usual lines of dietetics, hygiene, training, with a few drugs. Iodide of potash is one of the most valuable of the remedies used. See 'Diseases of the Bronchi, Nothnagel's System' (1902).

Asti, as'te, a town of northern Italy, 28 miles east east-southeast of Turin. It is surrounded by dilapidated walls, and the streets, though wide, and possessing several noble mansions, have in general a mean and deserted appearance. The finest building is the cathedral, dating from 1348, and adorned with many excellent paintings. The trade is chiefly in wine and silk. Asti was in existence about four centuries before the Christian era. It was twice destroyed by the Gauls, and on the latter occasion was rebuilt by Pompey, who gave it its name. Alfieri was born here. Pop. (1901) 38,045.

Astig'matism, a term denoting a defect in the mechanism of the eye concerned with refraction. It interferes with the correct focusing at one point on the retina of all of the rays that come from a single point. One of the most frequent causes of this visual defect is the unequal curvature of the corneal surface, in its horizontal and vertical diameters, or in its seg-

ments. Nearly all eyes are slightly astigmatic and only in pronounced cases does it cause symptoms. Astigmatism is corrected by appropriate glasses. See EYE.

Astil'be, a genus of about eight species of hardy perennial herbs of the natural order *saxifragaceæ*, natives of Asia and eastern North America and often cultivated in shrubby borders for their showy masses of flowers which appear during summer. They closely resemble *aruncus* and *spirææ*, from which they are not readily distinguished by prominent characters, although they have eight or ten stamens and a 2-3 lobed pistil (twice as many as the petals), whereas in the two genera mentioned the stamens are numerous and the pistils several to many.

As'ton, William George, Irish philologist: b. near Londonderry, in 1841. He became interpreter and translator to the British Legation at Yedo, in 1870; assistant Japanese secretary at Yedo, in 1875-82; consul-general for Korea, in 1884; Japanese secretary at Tokio, in 1886; and was retired in 1889. He published 'A Grammar of the Japanese Spoken Language'; 'A Grammar of the Japanese Written Language'; 'A Translation of the Nihongi; or, Annals of Ancient Japan'; 'History of Japanese Literature,' etc.

As'ton Manor, an English manufacturing town in Warwickshire, forming a suburb of Birmingham. Pop. (1901) 77,310.

As'tor, John Jacob, American merchant: b. Waldorf, Baden, near Heidelberg, 17 July 1763; d. 29 March 1848. He came to America in 1783, where his elder brother had settled and invested his savings in the fur trade. In 1784 he went with a cargo of furs to London, sold them and formed connection with fur houses there, and as his capital increased, made annual trips to Montreal, buying furs there and shipping them direct to London, as Canada was allowed to trade only with the mother country. In 1794 Jay's treaty removed this embargo; and Astor, then in London, at once made a contract with the Northwest Company of Montreal and Quebec (then the magnate of the Canadian Northwest fur trade), imported furs from Montreal to New York, and shipped them to all parts of Europe and China. The surrender of the lake posts under the treaty also greatly extended the trading limits, and Astor in a few years became one of the leading merchants and capitalists of the country, having a quarter of a million in 1798, and double that a few years later. In 1807 he embarked in direct trade with the Indians by way of the Mohawk, and with the English fur companies; but found the American trade chiefly monopolized by the Mackinaw Company, and knowing our government's desire to keep its home trade in home hands, proposed with its protection to accomplish this himself. In 1809 he secured a New York charter for the "American Fur Company," but the War of 1812 suspended operations, and after it a government prohibition of British fur trade in the United States broke up the company. Meantime a grander scheme had been initiated. Sir Alexander Mackenzie, after crossing the Continent far north in 1793, had suggested establishing a line of trading posts from ocean to

ASTOR

ocean, with terminal, coast, and island stations, to draw all except the Russian fur trade into one channel. Lewis and Clarke's transcontinental American expedition in 1804 proved its practicability on American soil; and Mr. Astor evolved the plan of distributing such posts along the Missouri and Columbia Rivers, with a central station at the mouth of the latter, where all the peltries from the interior posts and those gathered by coasting vessels were to be collected, and taken by a yearly ship to Canton, loading in return with Chinese goods. A later development was to operate a line of ships from the Pacific coast to the Chinese and East Indian ports, with a Hawaiian island for an intermediate port. The Russian fur company had already complained to the United States of the casual American trading vessels selling liquor and firearms to their Indians; our government had consulted Astor for a remedy, and his idea was to abolish this irresponsible trading by making his yearly supply ship take its place. To prevent ruinous competition, he offered the Northwest Company a one third interest in the enterprise; but they declined it, and sent a company to seize the mouth of the Columbia before his party could arrive. He succeeded in spite of them, however, in planting a settlement, which was named Astoria; but on the breaking out of the War of 1812 the English seized it. It reverted to the United States by the Treaty of Ghent, and Astor wished to revive the project, but the government was cool, and he dropped it; still, however, buying his furs direct and trading with many countries, more particularly China, at that time the best fur mart in the world. He also made large amounts by buying depreciated government securities, which afterward commanded a considerable premium. But his chief investment was the one which has founded the family greatness on a rock. Foreseeing the immense growth of New York city, he bought large tracts on Manhattan Island far beyond the then city limits, taught his son to invest his accumulations in the same way, and established the system of handling them described under **ASTOR FAMILY**. In 1827 he and his son William, who had been his partner since 1815, withdrew from the China trade and formed the American Fur Company, chiefly managed by the great expert; but a few years later he retired from business altogether, thenceforth devoting himself to his investments, and devising, in consultation with others, plans for a public library suggested by Washington Irving, — afterward the Astor Library, for which he left \$400,000 in his will. He made gifts and bequests to other objects; among them \$50,000 for a school for poor children and a home for the indigent aged in his birthplace, Waldorf, called the Astor House. He was much more than a great trader: he had a breadth of conception, a combined energy and patience of execution, a mastery of detail, a retentiveness of memory, and a sagacity of judgment, which in the judgment of his intimates would have raised him to greatness in any line. He left two sons, William B. and John Jacob, and three daughters.

As'tor, John Jacob, an American capitalist and soldier, son of William B.: b. New York, 10 June 1822; d. 22 Feb. 1890. He was educated at Columbia University and at Gottingen; he then

took the full course at the Harvard Law School, and practised law for a year, solely to qualify himself for assisting in the management of the immense estate, one half of which later descended to him. In the Civil War he served on McClellan's staff, with the rank of colonel; and was a devoted and hard-working military student. He always regarded this period as the best of his life, and attended the reunions of the Loyal Legion with zeal. Not only was he always a liberal giver to public institutions and charities, but he gave much personal time and devotion to them, especially to the Astor Library and Trinity Church; but he shrank from public notice. On his father's death in 1875 he received half of the estate, estimated at considerably over \$100,000,000; all which, with accumulations believed to have swollen it to some \$200,000,000, he left to his only son, William Waldorf Astor. His wife, Charlotte Augusta Gibbs, was an active assistant in his charitable work, taking part in personal service as "Sister Augusta," incognito.

As'tor, John Jacob, American capitalist and inventor, fourth of the name, nephew of John Jacob the third, and son of William: b. Rhinebeck, N. Y., 13 July 1864. He graduated from Harvard in 1888, and for the next three years traveled abroad. He is the manager of the Astor properties in America; a director in many banking, insurance, and railroad companies, and member of various clubs and social organizations. He built in 1897 a very costly hotel, the Astoria (named after the famous fur settlement of 1811), on Fifth Avenue, New York, adjoining the Waldorf built by his cousin, William Waldorf, the two being now joined as the Waldorf-Astoria. Besides his business activities, however, he has strong individual faculties. He is an expert in marine mechanics, inventor of a bicycle brake, and a pneumatic road improver; and is a member of scientific and other intellectual societies. He has written 'A Journey in Other Worlds a Romance of the Future' (1894). He was on Gov. Morton's staff 1894-6, and in the Spanish-American war of 1898, was commissioned lieutenant-colonel of United States Volunteers, and served in the Santiago campaign.

Astor, William Backhouse, American merchant and capitalist, eldest son of John Jacob Astor: b. New York, 19 Sept. 1792; d. 24 Nov. 1875. He was trained in his father's business in the intervals of public school education; and the father is said to have remarked that "William would never *make* money, but would keep what he had." At 16 he was sent to Heidelberg University, and at 18 went to Gottingen, where he was tutored by Bunsen, afterward the great chevalier. Returning to New York in 1815, he was made a partner in his father's foreign shipping trade, especially cultivating the Chinese field. The firm was John Jacob Astor & Son till 1827, when it dissolved and both partners gave up the China trade to form the American Fur Company, of which William was president, but John Jacob the head manager till he withdrew from active business life a few years later. He was shortly followed into retirement by his son. By 1848 he had amassed a fortune of his own; besides receiving a legacy of half a million from his uncle Henry, and a gift of the Astor House

ASTOR—ASTORIA

from his father; the latter on his death in that year leaving him sole legatee save for minor bequests, the property being estimated at \$20,000,000 to \$30,000,000. His life thenceforth was spent in conserving and developing this. He built nearly a thousand houses on his uptown lots, and was currently termed "the landlord of New York." He was also a heavy investor in other lines, notably coal and railroad stocks. He founded the Astor Library under his father's bequest, adding by gifts and bequests over \$600,000 to his father's gift, giving much time to its administration from the completion of the building in 1853 on his plans. His wife was the daughter of Madison's second secretary of war; his sons were John Jacob and William, and the estate was shared between them.

Astor, William Waldorf, an American capitalist, son of John Jacob the third: b. New York, 31 March 1848. He is the head of the chief Astor estate. He was educated by private tutors; studied law to qualify himself for the management of his estates, and assumed it in 1871. He was elected to the New York State lower legislative chamber in 1877, and to its Senate in 1879; and was an unsuccessful candidate for Congress in 1881. In 1882 he was appointed minister to Italy by President Arthur, and remained such till 1 March 1885. He made literary capital out of this in 'Valentino' (1885) and 'Sforza' (1889). He succeeded by his father's death in 1890 to a fortune estimated at some \$200,000,000, and the same year removed to London. Shortly afterward he built the famous and costly New York hotels, the New Netherland and the Waldorf. In 1893 he bought the 'Pall Mall Gazette' and founded the 'Pall Mall Magazine,' and in 1899 took the oath of allegiance as an English subject.

As'tor Family, a famous American family representing one of the three or four greatest private properties in the world. A family in the Old World sense,—a territorial aristocracy, impossible to destroy, and fortified with legal immunities and privileges,—can hardly be founded in America; but the Astors have approached it as nearly as our institutions will admit. They form a group of immense hereditary real-estate owners, with holdings so solidly based and well distributed in the metropolis of America that no apparent catastrophe save a failure of heirs could extinguish it; and though originally springing from mercantile business, removed by some three quarters of a century from its actual conduct. For many years they were known as "the landlords of New York," and the best of landlords, prompt, just, and courteous; still probably form the largest set of individual real-estate holders. The family is also connected with notable municipal charities and public foundations. See **ASTOR, JOHN JACOB** (1763-1848); **ASTOR, JOHN JACOB** (1822-90); **ASTOR, JOHN JACOB** (1864-); **ASTOR, WILLIAM**.

Astor Library. See **NEW YORK PUBLIC LIBRARY**.

Astor Place Riot, in American history: a riot on the evening of 10 May 1849, in Astor Place, New York. It was an attempt to drive the English actor, William Charles Macready (q.v.) from the stage, and grew out of a London tour of Edwin Forrest (q.v.), in which he

played *Virginius* and *Richelieu* with great success till Macready bought the acting rights for himself, though he had personally treated Forrest with kindness. Forrest then essayed *Macbeth*, but it was unsuited to his style and presence, and he was hissed. He attributed this to Macready's machinations, and when Macready four years later announced 'Macbeth' in the Astor Place Opera House, a crowd of Forrest's partisans gathered early in the evening before the theatre, and waiting till the performance had begun, attempted to force a way inside and put a stop to it. The police were powerless and sent for the military; the Seventh Regiment (New York militia) came up, and was assailed by the mob with showers of brickbats and stones. Before the fray was ended, 34 rioters were killed, a great number wounded, and 141 of the regiment injured by the missiles. The mob was successful in its purpose, however: Macready had to cancel his engagement, conceal himself in a private house for a couple of days, and then travel secretly to Boston, whence he sailed for England. See Barrett, 'Edwin Forrest' (1882).

Astor'ga, Emanuele d', an Italian composer: b. Palermo, 11 Dec. 1681; d. 21 Aug. 1736. He was educated in a monastery in Astorga in Spain, from which he afterward took his name. A 'Stabat Mater,' which he is said to have written in London, is considered the best of his works, and is still highly regarded.

Astorga, as-tör'ga, a city in Spain, the *Asturica Augusta* of the Romans. It figured prominently during the Peninsular war; was taken by the French after an obstinate defense, 1810; and retaken by the Spaniards, 1812. It is the see of a bishop. Pop. 5,000.

Astoria, Or, a city, port of entry, and seat of Clatsop County: on the Columbia River, nine miles from its mouth, and 101 miles by the Astoria & C. R. R.R. from Portland. Several foreign steamship lines touch here, the largest vessels coming up to its five miles of water frontage through the deep, broad channel scoured in the bar at the river mouth by a jetty. Its salmon fishing and canning industries are among the greatest in the world: several hundred boats go out to the fishing grounds on the bar every afternoon during the season of about 100 days, some 1,500 in all being employed; and the canneries utilize some \$2,000,000 capital, and turn out about 15,000,000 cans a year. It has also subsidiary can manufactories and iron works, great lumber works from the vast forests of the Pacific slope, flouring mills, breweries, etc.; and has a very large export trade in the special products of Oregon and Washington—lumber, wheat, oats, live stock, wool, potatoes, apples, etc. Among its buildings, the most notable are the United States custom-house, the post-office, and St. Mary's Hospital (R. C.). For the founding of Astoria in 1811, see **ASTOR, JOHN JACOB**. On its seizure by the English in the War of 1812, they renamed it Fort St. George; in 1818 it was restored to the United States, though occupied till 1845 by the fur stations first of the Northwest Company, then of the Hudson Bay Company with which the former consolidated. It received a city charter in 1876. Pop. (1900) 8,381.

Asto'ria, or **ANECDOTES OF AN ENTERPRISE BEYOND THE ROCKY MOUNTAINS**, a rambling

ASTRABAD — ASTRO-PHOTOGRAPHY

work by Washington Irving (1836). It comprises stories of expeditions by land and sea, and as a chapter of Far West history, does not lose its value by the lapse of time.

Astrabad, às'tra-bad', a town of Persia, about 30 miles east of the Caspian Sea. It carries on a trade in horses, sheep, cotton, silk, woolen fabrics, etc., and is connected by caravan with Afghanistan and is the seat of a Russian consulate. Pop. estimated at from 4,000 to 10,000.

Astræa, in mythology, the daughter of Zeus and Themis, and goddess of justice. In the age of gold she was a regular inhabitant of this world; in the age of silver an occasional visitor; and in the age of brass, when men began to forge weapons of war, fled to the skies, where she is seen in the zodiac, forming the constellation Virgo. She is usually represented with scales in her hand and a crown of stars on her head.

Astræ, **The Divine**, a name applied to the English novelist and dramatist, Mrs. Aphra Behre, who was noted for the coarseness of her plays. "The stage how loosely doth Astræa tread."

As'tragal, in architecture, a small semi-circular molding, with a fillet beneath it, encircling a column and separating the shaft from the capital.

As'tragaloman'cy (Greek *astragalos*, in the plural = dice, and *mantia* = divination), a pretended divination performed by casting down dice with marks corresponding to letters of the alphabet, and observing words thus formed. It was practised in the temple of Hercules, in Achaia.

Astragalus. See **Foor**.

Astrag'alus, **Milk Vetch**, a genus of more than 1,000 species of hardy leguminous herbs and under shrubs which, except in Australia where they have not been found, are of world-wide distribution on dry soils. *A. gummifer* and other species yield tragacanth (q.v.) gum. Certain species native to the western United States called crazy weeds (q.v.) are considered responsible for crazy disease of stock. The leaves are usually pinnate; the flowers arranged in racemes, white or purple. A few native and foreign species are grown from seed for ornamental purposes. They succeed best on dry, porous soil in sunny situations.

Astrakhan, às'trakhân', a government in the southeast of European Russia, on the Caspian; with an area of about 92,000 square miles. It consists almost entirely of two vast steppes, separated from each other by the Volga, and forming for the most part arid sterile deserts. The live stock consist chiefly of sheep of the broad-tailed species. The chief employments are pasturage and fishing—the former occupying the rural and nomadic tribes, and the latter the tribes on the Caspian coast and the banks of the Volga. Pop. (1897) 994,775.

As'trakhan', the capital of the Russian government of the same name. It is situated on an elevated island in the Volga, about 30 miles above its mouth, and consists of crooked, dirty, but broad streets, with irregular lines of houses. The communication with the opposite banks of the river is maintained by numerous bridges.

The most important edifice is the cathedral, of a rectangular form, with four small gilt and painted cupolas on the roof, and a large one in the centre. The manufactures, consisting of silks, cottons, woollens, shagreen skins, morocco leather, and soap, are increasing in extent. The fisheries furnish the staple articles of trade. Immense quantities of fish, caviar, and isinglass are exported to foreign countries. In the fishing season from 20,000 to 30,000 persons connected with the fisheries frequent the city. It is the naval station of the Caspian fleet; is the most important port of the Caspian, and has regular steam communication with the principal towns on the shores of that sea. Pop. (1897) 113,001.

As'trakhan', a name given to sheep-skins with a curled woolly surface obtained from a variety of sheep found in Bokhara, Persia, and Syria, and also to a rough fabric with a pile in imitation of this.

As'tral Spir'its, spirits believed by the Greeks and Orientals to inhabit the heavenly bodies or the aerial regions. In the Middle Ages they were variously conceived as fallen angels, souls of departed men, or spirits originating in fire, and belonging neither to heaven, earth, nor hell. Paracelsus regarded them as demoniacal in character.

As'trapothe'rium, an extinct hoofed animal found in the Miocene formations of Patagonia. It is unlike any modern animal, but is distantly related to the extinct Toxodonts of South America. It was as large as a rhinoceros, had large tusks opposing each other in the upper and lower jaws, and a broad flexible muzzle like that of the hippopotamus, or possibly a short proboscis like that of the tapir.

Astringents. Substances that have the property of precipitating albumin and other proteids act as astringents. When used on mucous membranes they contract the tissues, diminish the blood supply, decrease the mucus and modify the sense perceptions in the part. In the mouth they cause the well-known sensation of puckering. Their action is purely local. Vegetable astringents all contain tannic acid, to which substance their action is due. Nearly all of the mineral salts are astringent when used well diluted with water. In concentrated solution their coagulant action is so pronounced as to cause death of the tissue (caustic). The astringents are particularly serviceable in stimulating atonic mucous membranes, causing them to secrete less mucus. They are thus useful in chronic diarrhœas, in leucorrhœa and in mucous discharges from other parts of the body. The most serviceable of the vegetable astringents is tannic acid, or its compounds, tannalbin, tannigen, and related bodies. Of the mineral salts, solutions of copper sulphate, zinc sulphate, lead acetate and the aluminum salts are the most useful.

As'tro-photog'raphy. It seems likely that attempts to photograph the moon were made by Daguerre in the course of the experiments which led to the first successful method for making optical images permanent. Certainly in 1840 Draper, of New York, obtained a crude and imperfect picture of the moon, after a prolonged exposure of the Daguerreotype silver plate. In 1851, and the years immediately following, the collodion wet-plate process was introduced and

ASTRO-PHOTOGRAPHY

developed. By this method De la Rue, Draper, and Rutherford were enabled to produce pleasing photographs of the moon. Much advance was made, during the same period, in the application of photography to other celestial objects, but it cannot be said that the results, on the whole, were other than interesting and suggestive. Obviously, however, the work was full of promise of better things, and the modern developments along this line afford an impressive illustration of the growth of a scientific toy into a potent instrument of research. In the early seventies the gelatine dry-plate became generally available, and from that time astronomical photography has steadily grown in effectiveness and applicability. In outline, astronomical photography is like any other photography. By means of a suitable lens an optical image of whatever is to be photographed is thrown upon the sensitive plate. It is immaterial whether the object be a landscape, the moon, an animal, or a constellation. After an exposure whose duration is determined by experience, the plate is removed and "developed" by any of the well-known processes. The result is a reproduction, in light and shade, of the optical image. From this plate, called a "negative," may be made prints, transparencies, etc. The obstacles met with, however, in carrying out this apparently simple process when applied to celestial objects, are many and great. On account of the rotation of the earth, the heavenly bodies are seemingly in motion from east to west. Some of them, moreover, have sensible motions of their own. Thus it is necessary to provide compensating motions for the camera or photographic telescope so that the image shall remain in the same place on the plate during exposure. This is a mechanical problem of great difficulty. Again, the camera must be used from the bottom of a deep atmospheric ocean turbid with smoke, dust, ice-crystals, and vapors, and swirling with currents and eddies. This obstacle is the most serious one in all astronomical work. It becomes more and more disastrous as the magnifying power of instruments is increased, and is but imperfectly overcome by careful selections of sites for observatories, and of times for work when the air is relatively quiet. There are many other difficulties which attend the processes of practical astronomical photography, but these two are fundamental. On the other hand, there are at least two fundamental advantages in the photographic method as compared with the direct visual method of studying the sky. When measurements are to be made—such as, for example, the measurement of the angular distance between two neighboring stars—the direct method often calls for careful, accurate work under trying conditions. The observer may be hurried, in a constrained attitude, or shivering with cold. Checks by a second observer may be of doubtful value on account of personal equation or changed conditions. If, however, the two stars be photographed on the same plate, the measurements may be made at leisure, in physical comfort, and with every precaution for insuring accuracy. In the second place, the effect of light-vibrations upon the sensitive substance of the photographic plate is cumulative. That is the longer the plate is exposed the greater the effect of the light upon it. (There is, no doubt, a maximum, but it lies outside the range

of photography.) Upon the retina of the human eye, however, or upon the optic nerve, there is no such cumulative result. We gain nothing by looking for a long time toward an object whose light is too feeble to affect the sense of vision. When, after a while, we see an object not previously discerned, it is because the attention is directed to it, not because the retina is more affected.

It is on account of this property of the photographic plate that prolonged exposures have revealed faint objects or peculiarities of structure, not visible to the keenest eyes aided by the most powerful telescopes. As an important though subsidiary advantage of the photograph, may be mentioned the possibility of presenting to the sight enlarged representations of relatively extensive celestial areas. The field of vision of a great telescope is very small. A photograph of a nebula or of a star-cluster, projected by a fine lantern, at once exhibits a convincing general view, revealing things in structure and arrangement which might long escape the notice of one studying the object with a telescope. The difference is much the same as that between a broad view of a landscape and the same examined through a long tube of small diameter. Photography is at present employed in almost every line of astronomical research. The general divisions of the subject are, however, indicated in what follows.

Star Charts—By agreement among the authorities of some score of observatories in different parts of the world, there has been undertaken the enterprise of photographing the entire heavens. The plates are of uniform size, and the lenses used are as nearly as possible identical in figure. One set of photographs is to include stars down to the eleventh magnitude, while a second set is to include everything that can be secured by the longest practicable exposure. The value of the resulting charts to the astronomy of the future can scarcely be overestimated. Had such a map been constructed a few centuries ago it would now throw great light on problems relating to the structure of the universe. Meantime the study of the photographs already secured has been of importance in modifying theories as to the distribution of the stars, in revealing asteroids, new stars (so called), and variable stars.

Photographs for Detail.—Up to the present time the greatest success in this line of endeavor has been attained in photographing the moon, the sun, and nebulae. The superb lunar photographs produced at the Lick Observatory and at the Observatory in Paris leave little to be desired, although they are inferior to the best views obtained by the direct use of the telescope. These wonderful pictures cannot fail to be of great future value in showing to what extent, if at all, changes take place on the surface of our satellite. The photographs of the sun are, thus far, somewhat less satisfactory as to minute details. The air between the observer and the sun is almost constantly disturbed, and it is not easy to take advantage of instants of "good seeing" for securing the pictures. Nevertheless the accumulations of solar photographs, taken as they are every day, constitute a most admirable history of what goes on in the sun's surface and help toward a correct understanding of solar physics. At recent total solar eclipses many

ASTRO-PHOTOGRAPHY

thousands of photographs of the corona have been secured. These naturally differ widely in scientific value, but it must be admitted that the best of them fall short of revealing all that is seen by the eye. The "fogging" of the plates from the light in the atmosphere in the solar direction obscures the image of the outer corona. The eye recognizes this faint extension rather by its tint than by its luminosity as compared with that of the sky. Photographs of the nebulae, on the other hand, taken by prolonged exposures on moonless nights, have greatly advanced our knowledge of the structure of these objects, and have led to modifications in the statement of the nebular hypothesis. Photographs of the planets have thus far failed to give satisfactory results in exhibiting surface markings.

Photographs for Measurement.—Aside from the construction of star-charts as described above, the photographic method is used in an increasing number of cases in which the most accurate angular measurements are desired, and is now fairly comparable with the heliometer method. Among the more important applications of the new process is the determination of parallax by photographing Mars when near the eastern horizon and again when near setting; the rotation of the earth, meantime, having carried the observer from one end to the other of a base-line whose length depends upon the latitude of the station and the time between the exposures. Precisely the same method was applied to the newly discovered asteroid Eros during the latter part of the year 1900. It is clear that the difference in place of the planet among the stars, when the eastward picture is compared with the westward, is due to parallax, allowance being made for the movements of the planet and the earth during the interval between the observations. A similar method may be used in investigations of stellar parallax, the photographs being taken at half-yearly intervals, thus securing a base-line nearly or quite equal to the diameter of the earth's orbit. Photographs of stellar spectra afford a means for detecting and measuring the motion of stars in the line of sight by noting the displacement of the lines toward either end of the spectrum. Through investigations of this sort it has come to be believed that there are many large, dark stars associated with visible stars, constituting, in some cases, systems of great complexity. The existence of such a dark body is inferred from the alternate approach and retreat of the visible star, relatively to the earth, this motion being apparently due to a revolution of the bright star about, or with, an invisible companion. In some cases, also, the periodic duplication of the spectral lines seems to indicate that a star is double, both components giving out light, while the largest telescopes fail to resolve the pair to the vision.

Photometry.—With a given time of exposure the size and blackness of the stellar images are proportioned to the brightness of the stars. This fact renders it easy to prepare lists of stars in order of brightness or "magnitude." The method is the less valuable, however, for the reason that the color of a star influences the chemical effect of its light upon the plate. A bright red star gives a smaller image in a given time than a fainter white or blue star. A complete photo-

metric classification of the stars should be based upon measurements of the intensity of several portions of their spectra.

Transits, etc., by Photography.—By mechanical means it has been sought to eliminate the personal equation by photographing a star and the reticle of a transit or similar instrument at intervals automatically measured and recorded by clockwork. This must be taken as a very general statement of a method which, in a variety of forms, may yet be developed to a high degree of usefulness.

Instruments for Astronomical Photography.—It is well known that the lens of a visual telescope is quite unfit for photographic work. Those portions or components of white light that are best for seeing are not the components most effective in producing the negative. The blue and violet rays, left outstanding in the chromatic correction of the ordinary telescope, are precisely the ones wanted in photography, and they confuse and spoil the negative when the visual lens is tried as a photographic lens. Hence there must be a special objective for use in photographing, or an auxiliary lens for transforming the visual objective for its new work. So-called "portrait" lenses are much in use when a short focus, with large field and small images, is required. Lately much progress has been made in the use of mono-chromatic plates covered by colored glass screens, for absorbing the light that is not wanted. In this way it is possible to do good work in certain lines without a special lens. The accurate pointing of the telescope or camera is a matter of extreme difficulty, especially during long exposures. No driving clock yet produced, even when controlled, through electric devices, by the standard time-piece, is quite satisfactory. Therefore, it is necessary, in very many cases, that two telescopes, one visual and one photographic, should be bound together, and that an observer should keep the pair accurately pointed by hand. This is a most delicate operation, calling for great power of concentration, and for special deftness of touch. The observer, with eye at the visual telescope, keeps the cross-hairs of the eyepiece precisely upon a selected star. He watches and modifies the rate of the driving clock, moves the telescope as atmospheric refraction varies, and seeks in general to prevent all motion of the image on the plate. Upon the successful accomplishment of this difficult undertaking depends the final value of the photograph. In certain classes of work, however, the stars are allowed to "trail" a little, so that their images may readily be distinguished from specks and imperfections in the plate. The "coudé" telescope is much favored in Europe for photography, on account of the great steadiness of the eye-end and the comfort afforded the operator. In this country, when long-focus lenses are to be used, the tendency is toward the fixed horizontal telescope, a detached siderostat reflecting the light from the object into the telescope.

Among the more important adjuncts in instrumental devices should be mentioned the beautiful machines for measuring distances on the photographic negatives, this apparatus taking the place of the micrometer eyepieces used for direct measurements with the telescope.

F. S. LUTHER.

ASTROCARYUM—ASTRONOMY

As'trocar'yum, a genus of about thirty species of tropical American pinnate-leaved palms noted for their profuse sharp spines sometimes a foot long. *A. murumuru*, the murumuru palm, a common species in the lower Amazon region, seldom attains a height of more than 20 feet. It bears an edible, melon-flavored, musky-scented ovate fruit about an inch long, the pulp of which is highly prized as food for man and cattle. Hogs crush the seeds, which are almost as hard as vegetable ivory, and fatten well upon them. *A. tecuma*, the tecuma palm, reaches a height of 30 to 40 feet, and has very regularly arranged spines, bears an edible, globular fruit, and is native of the same region as the preceding species. *A. vulgare* is a taller-growing palm than the above. The unexpanded leaves furnish a strong fibre, for which the tree is often cultivated where it is not native. To obtain this fibre the terminal bud is cut and the epidermis of the delicate leaves carefully peeled in ribbon-like strips that when dry are twisted into fine, strong durable threads used for making twine, bowstrings, hammocks, fish-nets, etc. The fibre of older leaves is coarser, tougher, and stronger, and is used for cordage; the petioles of the young leaves are used for making into baskets and hats. This species, commonly known as the tecum palm, is distinct from the tecuma palm noted above, but was confounded with it by Maritius, who pictured the tecuma as the fibre-bearing species. Consult: Wallace, 'Palm Trees of the Amazon' (1853). Several species are cultivated in greenhouses for ornamental purposes and specimens as large as 10 feet tall often bear fruit. For culture, consult: Bailey and Miller, 'Cyclopedia of American Horticulture' (1900-2).

As'trolabe (from Greek *astron*, a star, and *lambano*, I take), the name given by the Greeks to any circular instrument for star measurement. In modern astronomy this instrument is no longer used, because wholly superseded by the sextant. The first application of the astrolabe to navigation was made by the physicians, Roderich and Joseph and Martin Behaim of Nurnberg, when John II., king of Portugal, desired them to invent a method of preserving a certain course at sea. Angles of altitude were found by suspending the astrolabe perpendicularly.

Astrology, the science which pretends to foretell future events, especially the fate of men, from the position of the stars. Originally, that is, among the Greeks and Romans, the word had the meaning of "astronomy," and, as in the case of alchemy and chemistry, the pseudo-science and the real science had the same origin. In early times, when the earth was regarded as the centre of the universe and as that to which all else was somehow tributary, it was a not unnatural hypothesis that the changing configurations of the heavenly bodies might be indicative of human destiny, or might influence human character. Hence, the Chinese, the Egyptians, the Chaldeans, the Romans, and most other ancient nations, with the honorable exception of the Greeks, became implicit believers in astrology. It was partly the cause and partly the effect of the prevalent worship of the heavenly bodies. The "star-gazers," sarcastically referred to in Isa. xlvii. 13, were perhaps astrolo-

gers; so also may have been what are called in the margin "viewers of the heavens"; but the Hebrew word rendered "astrologers" in Dan. i. 20; ii. 2, 27; iv. 7; v. 7, is a much vaguer one, meaning those who practise incantations, without indicating what the character of these incantations may be. The later Jews, the Arabs, with other Mohammedan races, and the Christians in mediæval Europe were all great cultivators of astrology. Some of the greatest astronomers, among whom was John Kepler, who knew very much better, were accustomed to "cast horoscopes," and to receive large fees for so doing. The ordinary method of procedure in the Middle Ages was to divide a globe or a planisphere into 12 portions by circles running from Pole to Pole, like those which now mark meridians of longitude. Each of the 12 spaces or intervals between these circles was called a "house" of heaven. The sun, the moon, and the stars all pass once in 24 hours through the portion of heavens represented by the 12 "houses." Every house has one of the heavenly bodies ruling over it as its lord.

The houses symbolize different advantages or disadvantages. The first is the house of life; the second, of riches; the third, of brethren; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; and the twelfth, of enemies. The houses vary in strength, the first one, that containing the part of the heavens about to rise, being the most powerful of all; it is called the ascendant, while the point of the ecliptic just rising is termed the horoscope. The important matter was to ascertain what house and star was in the ascendant at the moment of a person's birth, from which it was deemed possible to augur his fortune. It followed that all people born in the same part of the world at the same time ought to have had the same future, an allegation which experience decisively contradicted. Even apart from this, astrological predictions of all kinds had a fatal tendency to pass away without being fulfilled; and when, finally, it was discovered that the earth was not the centre of the universe, but only a planet revolving around another body, and itself much exceeded in size by several of its compeers, every scientific mind in Europe felt itself unable any longer to believe in astrology, which has been in an increasingly languishing state since the middle of the 17th century. It still flourishes, however, in Asia and Africa, and is a means of livelihood to many charlatans who prey upon the ignorant classes in all countries.

As'tronom'ical and As'trophysi'cal Society of America, a national society whose members must possess technical knowledge of astronomical and astrophysical science. Membership (1903) 180.

Astronomy. Astronomy is that branch of science which treats of the heavenly bodies—including practically all the bodies of the universe. The great advance which our times have witnessed in the methods of research has made it one of the most progressive of the sciences, while it is, at the same time, the oldest of all. The vast extent of its field, including the entire universe within its bounds, leads to its having

ASTRONOMY

a number of different branches. There is, first, a branch which embraces our general knowledge of the heavenly bodies, their motions, aspects, and physical constitution. This branch is commonly termed descriptive or general astronomy. It is now recognized as having two divisions, one relating principally to the motions, mutual relations, and general aspects of the heavenly bodies; the other to their physical constitution, considered individually. The former division is sometimes termed astrometry, because it is principally concerned with measurements of position, motion, mass, etc. The other branch is termed astrophysics, and is that which has received its greatest development in recent times. There is also a branch which teaches the methods of observing the heavenly bodies, including the instruments used in observation and measurement, and the principles governing their use, as well as the practical computations incident thereto. This branch is termed practical astronomy. Another branch is the mathematical one, which determines the orbits and motions of the heavenly bodies by deductive methods, taking as a basis the facts of observation and the laws of motion, especially that of gravitation. This branch treats of the orbits of the heavenly bodies and of the methods of computing the effects of their mutual attraction. It is commonly termed theoretical astronomy, while the more purely mathematical theory is known as celestial mechanics.

The subject of astronomy is treated in the present work on the following plan: We begin with a brief but comprehensive survey of the universe, referring to special articles—Stars, Universe, Nebulae, Solar System, etc., for details. This survey will be followed by reviews of Practical Astronomy, Theoretical Astronomy, and of the historical development of the science.

Descriptive Astronomy—Considered as to their nature, the heavenly bodies may be divided into two great classes; the one, incandescent bodies which shine by their own light; the other, opaque bodies which are visible only by reflecting the light of some incandescent body in their neighborhood. Examples of the first class are the stars which stud the heavens at night; examples of the second are the planets, of which our earth is one. From the very nature of the case, little can be learned of the possible number of opaque bodies which may exist in the universe. There may be some rather uncertain ground for inferring that they are less massive and less numerous than the incandescent bodies; but it is sometimes supposed that they may far outnumber the latter without our being aware of the fact. The stars are scattered through the wilderness of space at distances which baffle all our powers of conception. Light moves with such speed that it would make the circuit of the earth seven times in a single second. But the cases are rather exceptional when a star is so near one of its neighbors that light would not take years to travel over the distance which separates them. Indeed, the only known exceptions belong to the class of double or multiple stars—two or more such bodies forming a system by themselves. There is only one star so near us that its light would reach us in four years, and the same is probably true of most other stars. That the universe of stars extends to distances

which light would require several thousand years to travel is certain; but no well-defined limit has yet been set to its extent. Our sun is one of the stars, and is the one of which we know most because of our proximity to it. It is the centre around which eight great planets and a number of other bodies perform their revolutions. On one of these great planets, the third in the order of distance, we dwell. Our knowledge of the heavens is largely conditioned by our residence on this planet. We see the other planets by the light of the sun, which they reflect. They present to the naked eye the appearance of stars; and it is only when scrutinized with the telescope that they are found to have a measurable apparent size. Vast indeed is their distance from the sun when measured by our standards. Yet, the dimensions of our solar system are very small when compared with the distance which separates the stars. Light passes from the sun to the outer planet, Neptune, in about four hours, while, as we have said, it requires years to reach any star. The nearest star is therefore thousands of times farther than the most distant planet. A most interesting question is whether other stars have systems of planets revolving round them, as our sun has. This is a question which it is impossible to answer conclusively. Planets revolving round the stars would be absolutely invisible through the most powerful telescope that man can ever hope to construct. In special cases, however, evidence on the subject is afforded by the spectroscope, which shows that great numbers of stars really have one or more dark bodies revolving around them. But, in order to be observable with the spectroscope, these bodies must be vastly larger than the planets which revolve round our sun. The existence of a planet like that on which we dwell could not be determined even with the best spectroscope.

The bodies of the solar system are bound together by the law of gravitation. Were it not for the attraction of the sun each planet would fly off in a straight line through space. Through the attraction of the sun all the planets are kept in their several orbits. Every consideration leads us to believe that gravitation extends from one star to all the others, but diminishing as the inverse square of the distance. But its effect on bodies so distant as the stars is too minute to be observed. Revolving double stars, however, show that in these exceptional cases, systems of two stars in proximity to each other are subject to the law of mutual attraction.

The three fundamental facts which determine the great phenomena of astronomy, as we observe them in the course of our lives are (1) the globular form of the earth on which we dwell; (2) its diurnal rotation on its axis; (3) its annual revolution round the sun. The first of these facts is so familiar to all that we need not discuss it. Out of it grow the general phenomena of the sky. The heavenly bodies surround us in every direction. They are really as numerous by day as by night, only in the former case they are blotted out by the brightness of the sky. To imagine the heavens as they really are we must fancy stars as always visible in every part of the sky. Then, by day, we should see the sun among the stars, and perhaps the moon also. Mere observation

ASTRONOMY

of a heavenly body gives us no idea of its distance. By looking at a star we cannot tell whether its distance is to be measured by hundreds of miles, by millions, or by thousands of millions, which it actually is. Hence, all the heavenly bodies appear to us to be at the same distance, as if they were set upon the interior surface of a stupendous sphere in the centre of which we seem to be placed. This imaginary form is called the celestial sphere; it is one of the most ancient conceptions of astronomy, and it is used in the science to the present day to represent the appearance of the heavens. It is divided into two hemispheres, a visible and an invisible one. The visible hemisphere is the half which is above the horizon, which we call the sky and can always see, except so far as obstructions or inequalities of the ground may prevent. The other half is below the horizon, and is hidden from our view because the earth is opaque. Were the latter transparent, we should see the heavenly bodies in every possible direction. The revolution of the earth on its axis produces the phenomena of day and night, and the apparent rising and setting of the heavenly bodies. This is known as the diurnal motion. The latter may be considered in two aspects, either as the real revolution of the earth on its axis, in a direction always toward the East, or as an apparent revolution of the heavens in the opposite direction, due to our being unconscious of the motion of the earth. In consequence of the diurnal motion the celestial sphere, seeming to our eyes to carry the heavenly bodies on its interior surface, appears to us to make a daily revolution on its axis. The two opposite points of the celestial sphere situated on the prolongation of the earth's axis are called the celestial poles. On these poles as pivots the celestial sphere seems to turn. They are called north or south according to the direction. Their apparent position in the sky depends on the latitude of the place where the observer is situated. A heavenly body situated at either pole does not seem to have any diurnal motion. This is nearly the case with the pole star, which dwellers north of the equator can always see at an altitude above the northern horizon equal to their latitude. A voyager into the southern hemisphere sees the pole star set when he crosses the equator. Then, the south polar star would be visible if there were one. But it happens there is no bright star very near the southern prolongation of the axis. In the United States, say from 30° to 45° of latitude, the pole star is at a corresponding altitude above the horizon, and all the stars in its neighborhood appear to make a diurnal rotation round it, without changing their form or position, and without ever setting. Any one who chooses can verify this fact by noting the appearance of the northern sky about the end of twilight, and then looking at it again two or three hours later. He will then see that stars below the pole have moved toward the east; those on the east side of it have risen higher, and those on the west side are lower, while those above have moved over toward the west. For us, therefore, the sphere of the heavens may be divided into three parts; a circle round the north celestial pole within which stars never set; a corresponding circle round the south

pole, the stars in which never rise above our horizon, and a broad middle region where they rise and set.

To represent the positions of the stars, astronomers imagine circles on the celestial sphere corresponding to the circles of longitude and latitude on the earth. As we imagine north and south meridians drawn on the earth from one pole to another, to measure terrestrial longitudes, so we imagine in the heavens circles drawn on the sphere from the north celestial pole to the south one. As the longitude of a place on the earth is expressed by the angle which its meridian makes with the meridian of Greenwich, so the corresponding quantity for a star is the angle which the circle through it makes with a certain prime meridian on the celestial sphere. This quantity for the stars is not called longitude, but *right ascension*, and the celestial meridians which determine it may be called *hour circles*.

In the same way as we have on the earth a great circle spanning it everywhere, equally distant from the two poles, and called the equator, so we imagine a circle spanning the heavens, everywhere equally distant from the north and south celestial poles, which is called the celestial equator, or the equinoctial. At any one place this circle will be apparently fixed in its position, always intersecting the horizon at its east and west points, and, in our latitudes, intersecting the meridian south of the zenith by a distance equal to our distance from the north pole. For example, to a dweller in latitude 40° , the highest point of the celestial equator will be 40° from the zenith, and 50° above the horizon. From this point it spreads toward the east and west until it intersects the horizon as just stated. As a traveler journeys south, the position of the celestial equator becomes more and more nearly vertical; at the equator it rises vertically and passes through the zenith; south of the equator it passes north of the zenith.

As the latitude of a place is measured by its angular distance from the equator north or south, so the corresponding number for a star is measured by its mean angular distance from the celestial equator, whether north or south. This is called the star's *declination*. Thus the right ascension and declination of a star determines its position on the celestial sphere just as longitude and latitude determine the position of a city on the earth.

We now have to consider the effect of the annual motion of the earth round the sun. If we watch the heavens at a certain hour every evening, say eight o'clock P.M., we shall find that the stars are every night a little farther advanced in their diurnal motion than they were the night before. If they are in a certain position at eight o'clock on one evening, they will pass the same position four minutes before eight on the next night, eight minutes before eight on the next night, and so on. In the course of a year these continually accumulating changes make up the whole 24 hours, so that a star which is in the zenith this evening will be on the meridian at eight o'clock in the morning six months hence, while at eight in the evening it will be at its greatest distance below the horizon. If we could see the sun among the stars, what we should notice would be that our luminary always forges a little

farther east day after day, and in the course of a year seems to make a complete revolution among the stars. The result is that while the sun rises and sets 365 times, the stars rise and set 366 times. Since the latter are always in the same absolute direction, and seem to rise and set in consequence of the earth's rotation on its axis, we infer that the direction of the sun from the earth goes through a complete revolution in the course of a year. In other words, the sun appears to us to make an annual revolution around the celestial sphere among the stars. Since the time of Copernicus it has been known that this appearance is due to the actual revolution of the earth around the sun.

The apparent path of the sun among the stars can be mapped out by astronomical observation. When carefully observed, it is found to be a great circle of the sphere, called the ecliptic. We thus have two imaginary circles of fundamental importance spanning the heavens. One is the celestial equator, the other the ecliptic in which the sun seems to travel. These circles do not coincide, but intersect each other at two opposite points at an angle of $23\frac{1}{2}^\circ$. This is called the *obliquity of the ecliptic*. The result of it is that during one half the year the sun is south of the celestial equator, and during the other half is north of it. In the northern half of its course we have summer in the northern hemisphere and winter in the southern; in the southern half we have summer in the southern hemisphere and winter in the northern. Thus the changing seasons are due to the obliquity of the ecliptic. If the latter coincided with the equator, we should have no such annual round of seasons as that with which we are familiar.

There are two opposite points on the celestial sphere at which the equator and the ecliptic intersect. These are called *equinoxes* because, when the sun crosses them, the days and nights are equal all over the earth. That equinox which the sun passes toward the north is called the vernal equinox, because the crossing marks spring in the northern hemisphere. The other is called the autumnal equinox for a similar reason. Observations continued through many centuries show that the equinoxes are not fixed, but travel slowly along the ecliptic at such a rate that they make a complete revolution from the east toward the west in about 26,000 years. This motion is called the *precession of the equinoxes*. Its existence shows that the direction of the earth's axis is slowly changing, and hence the position of the celestial pole is changing also. Since the equator is defined by the condition that it spans the heavens midway between the celestial poles, this change in the poles causes a corresponding change in the equator.

The actual motion of the pole is at the rate of about $20''$ per year. The smallest visible object that can be seen to be anything else than a point of light subtends an angle of about $1'$ or $60''$. It follows that the pole moves through this smallest visible space in three years. In a long life of 90 years the change would be about equal to the diameter of the sun or moon. The centre of the motion is the pole of the ecliptic which is distant from that of the equator by about $23\frac{1}{2}^\circ$. Owing to the smallness of the obliquity, the equinox travels along the ecliptic at more than twice the rate of the pole, or about $50''$ per year. It

has therefore changed about 30° since its motion was first noticed, about 2,000 years ago. It is found that the planets describe their course around the sphere in circles which do not deviate greatly from the ecliptic. A belt of the heavens extending 11° on each side of the ecliptic will include all the planets visible to the naked eye. This belt is called the *zodiac*. Beginning at the vernal equinox it is divided into 12 portions, of 30° each, known as the signs of the zodiac. In former times great stress was laid upon the entrance of the sun into these several signs, which entrances occurred about a month apart. They now occur about the 20th of every month. In our times, when the superstitions connected with this subject have vanished, the entrance of the sun into the signs is no longer of importance. (See *ZODIAC*.) There are also 12 constellations, beginning with Aries, and ending with Pisces, which have the same names as the signs of the zodiac, and are scattered along its course. Two thousand years ago these constellations coincided pretty closely with the signs. But now, in consequence of the precession of the equinoxes, the two no longer correspond. The sign Aries is now located in the constellation Pisces; the sign Taurus in the constellation Aries, etc.

The Time of Day.—It is in its relations to times and seasons that the results of astronomical science come into every household. Our daily round of activity and rest is determined by the earth's rotation on its axis, alternately bringing us under the sun, and then carrying us around until it is hidden from our sight. A century ago people used to set their clocks at 12 when the sun crossed the meridian. This moment, being the middle of the day, is noon properly so-called. But if a good clock is exactly regulated, and kept going all the time, it will not show noon at the true time. The reason is that the intervals of time between one noon and the next are not exactly the same. See *TIME*.

Bibliography.—The most extended general treatise on astronomy for the use of the general reader is 'Chambers' Astronomy' (3 vols., 8 vo., London); briefer is Newcomb's 'Astronomy for Everybody'; Ball, 'Story of the Heavens'; Flammarion, 'Popular Astronomy'; etc.

SIMON NEWCOMB, LL.D.,
Washington, D. C.

Astronomy, History of. We may recognize four great periods in the history of astronomical knowledge. The first and most ancient is that in which no accurate observations were made, but in which men had a general knowledge of the apparent annual revolution of the sun, of the constellations, and of the relation of the sun's annual course to the changes of the seasons. The next period was that of the celebrated Alexandrian school, so-called because Alexandria was the principal seat of its activity. This period was distinguished as that at which the first attempts were made at precise observation and measurement. It began three or four centuries before Christ. It is very remarkable that, at so early a period as this, men to whom all our modern science was completely unknown, had so far advanced in astronomical observation as to measure the obliquity of the ecliptic, determine the times of the equinoxes, and detect their precession. The latter was done by a comparison of two meth-

ASTRONOMY

ods of determining the length of the year, as measured by the sun's apparent revolution around the celestial sphere. Timocharis, who flourished about 300 B.C., determined the moment at which the sun crossed the equinox by means of an east and west line on the level sandy plains of Egypt, showing exactly where the sun rose or set. The day on which the point of setting in the west was exactly opposite that of its rising in the east marked the equinox, which could thus be determined within a few hours. The annual course of the sun can also be determined by the time which it takes to return to the same position among the stars after an annual apparent revolution. As the stars and sun cannot be seen at the same time, the adopted plan was to measure the distance of the sun from the moon before sunset, and after dark to measure the distance from the moon to some bright star. Allowing for the motion of the moon during the interval, the distance of the sun from the star would be known. In this way the curious discovery was made that the year as determined from the equinoxes was several minutes shorter than that determined from the stars. This discovery was made by Hipparchus through a comparison of his observations with those of Timocharis about 150 years before.

Erasthenes, who flourished just before Timocharis, was enabled to estimate the size of the earth. This he did by noting that at the ancient town of Syene, in central Egypt, the sun was exactly in the zenith at the time of the summer solstice, so that it illuminated the bottom of a well, while at Alexandria it was $1/50$ of a circumference south of the zenith. He therefore concluded that the circumference of the earth was 50 times the distance between Alexandria and Syene. The latter being 50,000 stadia, it followed that the circumference of the earth was 250,000 stadia.

Hipparchus was considered as the greatest astronomer of antiquity. He made more accurate observations than any of his predecessors upon the courses of the sun, moon, and planets, determining their times of revolution with extraordinary exactness. Unfortunately none of his works survive, and our knowledge of them is derived mainly from Ptolemy's 'Almagest.'

Ptolemaic System.—Ptolemy (130–150 A.D.), besides being a practical astronomer, was accomplished as a musician, a geographer, and a mathematician. His most important discovery in astronomy was the evection of the moon. He also was the first to point out the effect of refraction. He was the founder of the false system known by his name, and which was universally accepted as the true theory of the universe until the researches of Copernicus exploded it. The Ptolemaic system placed the earth, immovable, in the centre of the universe, making the entire heavens revolve round it in the course of 24 hours. The work by which he is best known, however, is the collection and systematic arrangement of the ancient observations in his great work, the 'Megale Syntaxis,' which gives a complete *résumé* of the astronomical knowledge of the day. This work was translated into Arabic in the first part of the 9th century and was called by the Arabs the 'Almagest,' and by this name it is known today in its various translations into Greek and

Latin. The most important part of it is the seventh and eighth books, which contain the catalogue of stars which bears Ptolemy's name, though it is only a compilation of the catalogue of Hipparchus with the positions brought up to the time of Ptolemy. The advance of astronomy almost ceased, after the death of Ptolemy, and his 'Almagest,' together with the false system of the universe which it taught, continued to be the recognized authority in Europe for the next 14 centuries.

With the death of Ptolemy, everything in the way of actual progress in astronomical theory appeared to cease. The Arabians continued astronomical observations from time to time, and made or proposed many improvements in the ancient astronomical instruments, but they slavishly followed the system of Ptolemy, and made no attempts to penetrate the mystery of the celestial motions. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. The most illustrious of the Arabian school were Albategnus, or Al Batani (880 A.D.), who discovered the motion of the solar apogee, and who was also the first to make use of sines and versed sines instead of chords; and Ibn-Junis (1000 A.D.), an excellent mathematician, who made observations of great importance on eclipses of the sun and moon and the motions of Jupiter and Saturn, and who was the first to use cotangents and secants. Likewise, at about the same time, Abul Wefa discovered the third inequality in the moon's motion, the variation, and determined its amount. About four centuries later, in the first half of the 15th century, lived Ulugh Beigh, a Tartar prince, who made important additions to astronomical knowledge.

The third period commenced when Copernicus, in 1543, first demonstrated the true theory of the universe to his fellow men in his great work 'De Revolutionibus Orbium Cœlestium.' His two fundamental principles were that, instead of the diurnal motion of the heavens being real, it was only apparent, being due to the revolution of the earth on its own axis; and that the apparent revolution of the sun around the sky was, in the same way, due to the actual revolution of the earth around the sun, which latter remained at rest. Centuries of observation have shown that these two principles explain so exactly every detail of celestial phenomena that they are subject to no more doubt than our conclusions as to the arrangement of streets and houses in a city which we see every day of our lives. Half a century after the death of Copernicus flourished Galileo and Kepler, of whom the first invented the telescope, while the second demonstrated the correctness of the Copernican theory, and also showed that the planet Mars revolved around the sun in an ellipse with the sun in its focus.

The invention of the telescope added another proof to the Copernican theory, and also enlarged our views of the universe by showing that Jupiter and his satellites formed a miniature solar system on the Copernican plan; that the planet Venus had phases like the moon; that the moon itself had a variegated surface apparently similar to that of our globe, and that the wonderful Milky Way was composed of innumerable stars too faint to be seen sep-

ASTRONOMY

arately by the naked eye. The spots on the sun were also discovered, and the rotation of our central luminary on its axis made known. Such enormous advances were too great for the human mind at once to grasp, and the generation in which Galileo lived had to pass away before the Copernican theory was universally accepted by the learned world. To this same period belong the observations of Tycho Brahe on the motions of the sun, moon, and planets, which were, most unfortunately, made just before the invention of the telescope, and so failed of the precision which would have been gained by the use of that instrument. But, as it was, they were the basis on which Kepler founded his celebrated laws of planetary motion.

The fourth and last period began when Newton showed that all the complicated phenomena of the celestial motions—the revolution of the planets in elliptic orbits, and the revolution of the satellites around their primaries, were all due to the mutual gravitation of these bodies, and took place according to the same laws which govern the motion of matter around us on the earth. As in the case of the Copernican theory, it took the learned world a whole generation to grasp the idea of Newton as to the theory of gravitation. The progress made in our knowledge of the celestial motions during the two centuries since Newton's time have all rested on the principle which he discovered.

Toward the end of the 18th century, Sir William Herschel, then in the zenith of his fame, was interesting the whole world by his wonderful discoveries. With his great reflectors he made a step forward in the size and power of the telescope greater than any before or since. Although his greatest and best instrument would be considered extremely imperfect at the present time, those which it superseded were hardly more than what we should now call spy glasses. Herschel was so far the greatest figure of the time in astronomical science, and his work so overshadowed that of his contemporaries on the continent, that the work of everyone else at the time seems unimportant in comparison. Yet not only were great successors of Herschel coming on the stage, but important additions to our knowledge of the heavens were being made outside of England. William Herschel's son, John, was a lad of eight years. In France, Arago, a boy of 14, was fitting himself for the *École Polytechnique*. At Paris, Lalande, the leading astronomer of France, was actively preparing a catalogue of the fainter stars with an instrument which would now be consigned to the junkshop. But it was the first attempt that had ever been made to determine accurately the positions of the many thousand telescopic stars invisible to the naked eye, and in consequence the '*Histoire Céleste*' is still one of the classics of the astronomical investigator. In Germany, Olbers combined the professions of physician and astronomer, and Bessel, a youth of 16, was clerk in a mercantile house.

The first day of the century was marked by a discovery of capital interest and importance. The wide gap between the planets Mars and Jupiter had been a source of wonder, and the conviction that there must be a planet in it had become so strong that an association of astron-

omers was formed to search for it. But, on 1 Jan. 1801, before they got to work, Piazzi, the Italian astronomer of Palermo, found Ceres. The year following Olbers discovered Pallas, and propounded his celebrated theory that the newly formed bodies were fragments of a shattered planet, more of which might be found. This anticipation was amply justified by the result, though the theory of a shattered planet has long been rejected. By 1868 the number reached 100. When the sky was systematically watched 100 more were found. When the process of photographing the stars was perfected, so many new ones were found on the photographic plates that it is almost impossible to follow them up. About 450 have had their orbits mapped out. See **ASTERIODS**.

In this country, David Rittenhouse, almost the only American of Revolutionary times who has a place in scientific history, had been dead four years when the century began, and there was no one to take his place. He was one of the committee of the American Philosophical Society that made an extensive and well-planned set of observations on the transit of Venus in 1769. The first American after the Revolution to acquire eminence in any department of astronomical science was Nathaniel Bowditch. A Boston ship-captain by profession, he first prepared his '*Navigator*,' the standard work of the sailor through most of the century. He mastered the great work of Laplace, and made it accessible to students by a translation and commentary explaining the processes in detail. So far as practical astronomy was concerned, it might be regarded as non-existent among us during at least the first third of the century. We know little more of it than that Robert Treat Paine, grandson of the signer of the Declaration of Independence, used to compute eclipses and publish the results in the '*American Almanac*,' and the Boston *Advertiser*. About 1840, Dr. Lardner paid a visit to this country and remained several years, delivering public lectures, which, though not of a high order when measured by the standard of to-day, were much above any which Americans had then heard.

During the first half of the century, the advance of astronomical science consisted principally in a form of development which goes on without any striking discovery, and has therefore little interest for the general public. When bright comets appeared they were carefully studied by observers, at the head of whom were Bessel and Olbers. It was thus found that the tail of a comet was not an appendage carried along with it, like the tail of an animal, but merely a stream of vapor arising from it and repelled by a force residing in the sun. The discovery of telescopic comets by observers, here and there, continually added to the number of these bodies known. Most of them were found to be moving in such orbits that they would require thousands of years, perhaps tens of thousands, to return to the sun, if, indeed, they ever reappeared. But this, though the general rule, is far from being universal. From time to time comets were found moving in closed orbits and performing their revolution in periods of a few years, mostly between 3 years and 10.

One of the noteworthy discoveries of the third quarter of the century was that of the

ASTRONOMY

relation between comets and shooting stars. The first discovery of this relation came about in a curious way. The researches of H. A. Newton and others had made it quite clear that shooting stars were due to the impact of countless minute bodies revolving around the sun in various orbits and now and then encountering our atmosphere. It was also known that the great November meteoric showers must be due to a stream of such bodies. One astronomer computed the orbit of the November meteors; and another quite independently published the orbit of a comet which appeared in 1866. A third astronomer, Schiaparelli, noticed that the two orbits were practically the same. The conclusion was obvious. The minute bodies which caused the shower moved in the path of the comet and were portions of its substance which had from time to time separated from it. The disappointing failure of the shower in 1899 and 1900 can have but one cause—a small change in the orbit of the meteoric swarm caused by the attraction of the planets. Nor has the comet associated with them shown itself; it was perhaps dissipated like that of Biela's. Apart from this, the question of the constitution of comets is still an unsolved mystery. Their spectrum is that of a body which shines by its own light. But no one can explain how a body in the cold and vacuous celestial spaces can so shine. The brighter comets may have a more or less massive nucleus. Yet it is not certain that the nucleus is entirely opaque. In 1882, the astronomers at the Cape of Good Hope enjoyed an opportunity which no one of their brethren ever enjoyed before or since; that of seeing a comet enter on the disk of the sun. Unfortunately, the sun disappeared from view a very few minutes afterward. But not a trace of the comet could be seen on the sun as a spot. It was seemingly quite transparent to the solar rays. That the fainter comets have no nucleus and are merely composed of a collection of foggy particles seems certain. How are these particles kept together through so many revolutions? This question has not yet been satisfactorily answered. See COMET.

The Greenwich Observatory was taken in charge by Airy in 1834. He immediately instituted a great improvement in its organization and work, but it was not till 1850 that he acquired for it new instruments of great importance. He was the founder of what has sometimes been called the Greenwich system: the astronomers of an institution taking a part like those of soldiers in an army, making all their observations on a plan prescribed by the authority and rarely using their own discretion in any way. The mathematical theory of the motions of the planets, and especially the moon, received its greatest improvement from the hands of Hensen, born about 1795. He may fairly rank as the greatest of celestial mechanicians since the time of Laplace. Toward the middle of the century, he prepared the first tables of the moon which could satisfy the requirements of modern astronomic theory. These were published by the British government in 1857, and have now formed the basis of astronomical ephemerides for nearly half a century. The most striking event of the mid-century period, and one which in the popular mind must long hold its place as among the greatest of intellectual achievements, was the computation by

Leverrier of the position of an unknown planet from its attraction on Uranus. The speedy discovery of the planet on the very night it was first looked for was, for the public, a proof of the absolute correctness of gravitational theories that surpassed all others. It was as a first and bold attempt to sail into an unknown sea; yet, as in the case of Columbus and the Atlantic, its repetition would not now be generally considered a difficult matter. With the discovery of Neptune and with the advance in the art of astronomical observation, improvements in the theories of the movements of the planets were necessary. The greatest step forward in this direction was taken by Leverrier. Among the results of his work was the discovery that the perihelion of Mercury moves more rapidly than it should under the influence of gravitation. This excess of movement has been abundantly proved by observation since his time, but its cause is still one of the greatest mysteries of gravitational astronomy. As a general rule, it may be said that during the last half century the Germans have been the leaders in astronomical research. Their work on the subject has been more voluminous than that of any other nation. The leading astronomical journal of the world is still that of Germany. But when we consider not quantity of work, but the special importance of particular works, precedence has, from one point of view, passed to America. While, perhaps, we still have fewer students pursuing astronomy in the United States than in Germany, the number of men among us who have acquired the highest distinction and most skillfully made applications of this science is greater than in any other country. The rapidity of progress from small beginnings is very remarkable.

In 1832, Professor Airy delivered, before the British Association for the Advancement of Science, an address on the progress of astronomy, which soon acquired celebrity. The state of astronomy in different countries was reviewed. America was dismissed with the remark that he was not aware of any observatory existing in that country. In the revival of astronomy among us and its advance to its present position in popular favor, one agency has not been esteemed so highly as it deserves. Contemporaneous with the visit of Dr. Lardner were the lectures of Prof. Ormsby M. Mitchell. With unsurpassed eloquence he explained the wonders of astronomy to audiences intensely interested in the novelties of the subject. From a scientific point of view the lectures were probably not of a high order, nor could it be said that Mitchell himself, active and enthusiastic though he was, was a profound astronomer. Yet it may well be said that to him is due the ability of our astronomers since that time to secure the public support necessary to the erection of the fabric of their science. A few years after Airy's address small college observatories were founded at Williams College and at the Western Reserve College, Ohio. These were doubtless a stimulus to students, but can hardly have added to astronomical science. When the Wilkes Exploring Expedition was being organized, it was found necessary to have a continuous series of observations made at home during the absence of the expedition which, compared with those made on the ships, would en-

ASTRONOMY

able the navigators to determine the longitudes of the lands they discovered. A little wooden structure, erected by Captain Gilliss for this purpose, on Capitol Hill, Washington city, was in some sort the beginning of our National Observatory. The actual foundation of the latter was almost contemporaneous with that of the Harvard Observatory, both being commenced about the year 1843. The Harvard Observatory was placed under the direction of William C. Bond, who had, for many years, made observations, first at his own house in Dorchester, and then on top of a house at Cambridge. At Washington the Naval Observatory was placed under the charge of Lieut. Maury. After getting its instruments in operation, he devoted himself almost entirely to those researches on ocean currents, which, so long as the commerce of the world was carried on mostly in sailing vessels, were of the first importance. But the institution soon acquired astronomical celebrity in other ways. Here Sears Cook Walker made the first thorough investigation of the orbit of Leverrier's newly discovered planet, and showed that it had been twice observed by Lalande as far back as 1795, but without its character being suspected. Here also the device of recording the transits of stars by means of the chronograph and determining the longitude of places by telegraph found their first application. New observatories, some founded in connection with colleges, others by private individuals, now sprang up rapidly among us in every quarter. Twenty-four were enumerated by Loomis in 1856. What figure the number has now reached it is impossible to say. Whatever it may be, it marks rather the interest taken by the intelligent public in astronomical science than the actual progress of knowledge. The number of these institutions which have actually made important contributions to astronomical knowledge is naturally very small. It is to a few leading ones that most of the progress is due.

Two of these have put almost a new face upon astronomical science. These are the Harvard Observatory at Cambridge and the Lick Observatory of California. The former, while a respectable institution from its foundation, and made famous by the works of the Bonds, had never commanded the means necessary to prosecute astronomical research on a large scale. When Pickering assumed the directorship in 1875, he devoted his energies to those branches of research which are now known under the general term of astro-physics, being concerned with the physical constitutions of the heavenly bodies rather than with their motions. The extension of his work was made possible by very large additions to the endowment of the observatory. It thus became one of the best-supported institutions of the kind in the world. Photometry and spectroscopy have been its main subjects. With the aid of a branch established in Arequipa, Peru, the magnitudes of all the stars in the heavens visible to the naked eyes, as well as many fainter ones, have been determined. Among its remarkable discoveries have been those of new stars. It was formerly known that at long intervals, sometimes more than a century, sometimes less, stars apparently new blazed out in the sky. Really the star was not new, but was an old and very small one of which the light was tem-

porarily multiplied hundreds of thousands of times. A system of constantly photographing the heavens showed that such objects appear every few years, only they do not generally attain such brilliancy as to be noticed by the unassisted eye. The success of the Lick Observatory in a different, yet not wholly dissimilar, direction must be regarded as one of the most extraordinary developments of our time. Commencing work about the beginning of 1888, under the direction of Holden, and supplied with the greatest telescope that human art had then produced, the observations of Burnham and Barnard excited universal interest, both among astronomers and the public. The discovery of a fifth satellite of Jupiter, perhaps the most difficult object in the heavens, was made there by Barnard in 1892. Later, the optical discovery of the companion of Procyon, an object known to exist from its attraction on that star, was made by Schaeberle. But its most epoch-making work is due in still more recent years to Campbell, by measurements of the motion of stars in the line of sight with the spectroscope. The possibility of measuring such motions was first demonstrated by Huggins, some thirty years ago, and was applied both by him and by the observers at Greenwich. Then a great step forward was made by photographing the spectrum instead of depending on visible observation. This step was mostly developed by Vogel, at the Potsdam Observatory, near Berlin. In the case of the variable star, Algol, Vogel was thus enabled to show that the fading away of its light at regular intervals of something less than three days was really a partial eclipse of the star by a dark body revolving around it. He also showed that three other bright stars varied in their motions to and from the earth in a way that could arise only from the revolution of massive but invisible bodies around them. Now, at the Lick Observatory, Campbell, armed with the best spectrograph that human art could make, the gift of D. O. Mills, has, by the introduction of every refinement of his method, brought into these measures a degree of precision never before reached. The cases of variable motion, as found by him, are so numerous as to indicate that isolated stars may be the exception rather than the rule. It is true that up to the present time he detects variation in only about one star out of thirteen which he observes. But it is only in the exceptional cases, where the planet is almost as massive as the star itself, that the motion can be detected. It is not at all unlikely that, for every spectroscopic binary system (as these pairs of objects are now called) we can detect, quite a number may exist in which the revolving planet is too small to affect the motion of the star. With the beginning of a new century, astronomy, the oldest of the sciences, seems to be entering upon a new career, with a prospect of a life before it the end of which no man can foresee.

SIMON NEWCOMB, LL.D.,
Washington, D. C.

Astronomy, Practical. The instruments of observation used by the working astronomer are made up mainly of various combinations

ASTRONOMY

of three appliances. These are the telescope, the graduated circle, and the clock. (For the principles of the first see TELESCOPE.) With the clock is associated the chronograph as part of a combination for measuring time. Many auxiliary appliances are also brought into use of which the micrometer and the spirit level are the most important. The usefulness of the telescope in measurement does not arise solely from its enabling the observer to see objects

FIG. 1.

otherwise invisible. A telescope with no magnifying power at all would still enable him to determine the directions of the heavenly bodies at any moment with greater accuracy than would otherwise be attainable. The principle on which the telescope is used in celestial measurement will first be explained. Let Fig 1 represent the section of a telescope; A B being the object glass, and C the eye-end, where the rays from a star are brought to a focus. The lines converging to the plane E F represent the rays of light from a star reaching the focus. Here they form an image of the star, which the observer sees by looking into the eye-piece at C. The plane, of which the dotted line E F is a section, passing through the focus at right angles to the telescope, is called the focal plane. By changing slightly the direction in which the telescope is pointed, the rays may come to a focus on any point in this plane not too far from the axis or central line of the telescope. In the focal plane is placed a system of very fine threads which the observer sees when he looks into the eye-piece. These threads are generally made of fibres of spider-web, a substance so well adapted to this purpose that nothing better has yet come into use. To fix the ideas we shall suppose several cross threads; then the observer by looking into the telescope may see the stars and the

FIG. 2.

cross-threads as represented in Fig. 2. Here we have the images of two stars quite near the crossing point of the threads. The observer moves the telescope until one of the stars is seen exactly at the point of intersection of the two threads. The fundamental principle in the

use of the telescope is that when this occurs, the star is apparently situated exactly on a straight line passing through the cross threads, and the centre of the object glass. This line is called the line of sight of the telescope.

Now, let the observer move the telescope until he finds another star, whose image he brings upon the cross threads. The angle through which he has moved the telescope from one star to the other, supposing the two stars to be at rest, will then be precisely the angle between the rays of light coming from the two stars. If, then, any system is adopted of determining through how many degrees, minutes,

FIG. 3.

etc., the telescope has moved, the angular distance between the stars is known. The studious reader will remark that, owing to the rotation of the earth, the image of a star seen in a fixed telescope is continually moving across the field of view. To explain the principle we must, however, leave this motion out of account, or suppose it allowed for.

We have next to show how a large angle through which the telescope may be moved is measured. This is done by means of the graduated circle, a representation of which is shown in Fig. 3. It will be seen that the rim of the

ASTRONOMY

circle is divided up into degrees by fine lines as represented in the figure, where, however, only every fifth degree is marked. In the instruments actually used in astronomy, not only is every degree marked, but in the circles for the finest observations, the degrees are still farther sub-divided into spaces of 5', 3', or even 2'. Since there are 360° in a circumference, it follows that in a division to 2' there will be 10,800 of these graduations, or fine marks, on the circle. These marks must all be as nearly equi-distant as human art can make them, and the problem of doing this, together with that of making them so fine and sharp that they

FIG. 4.

can be used in the most precise measurement, is one of the most difficult with which the instrument maker has to deal. The way in which the divided circle is used to measure the angular motion of the telescope is shown by the dotted outline of the latter. The circle is attached to it so that both move on an axis concentric with the circle and perpendicular to its plane. Then, when the telescope is turned on this axis, the circle turns with it as a grindstone does on its axis. The distance through which telescope and circle are turned is then measured by means of the graduations. To show how this is done, other appliances must be described.

Instead of two stars being far apart, so that the telescope has to be moved, they may be

The Filar Micrometer.—This adjunct is so called because an essential part of it consists in fine threads of spider lines stretched across the field of view, as already described. The aim of its construction is to admit of these threads being moved in a direction at right angles to their length, by a very fine screw, so that the space over which they pass may be measured by the turns of the screw. The principal appliances for effecting this are a fixed frame, A B C D, Fig. 4, in which slides another frame, E F G, moved by a fine screw at S. Across this inner frame is stretched the spider line J, and across the fixed one the spider line H. To the head of the screw is attached a cylindrical rim, which has 100 or some other number of divisions cut upon it. An index mark serves to show how far the screw is turned. An apparatus for measuring the number of turns of the screw is attached, but need not be described here. Then when the observer turns the screw, the movable frame of the spider lines is slowly carried along with it. The position of the spider lines as they move is then shown at every moment by the number of turns of the screw and the fractions of a turn. To show the accuracy with which this can be done, we remark that the screws used by astronomers may have 100 or even 125 turns to the inch. Then, each revolution of the screw, as read off on the head, measures to a motion through this space. There being 100 graduations on the head, each graduation may measure the motion of 1-10,000 of an inch. But the observer may estimate the tenths between the divisions, thus carrying his measurements down to the 1-100,000 of an inch. Beside the movable spider line across the frame, fixed spider lines may also be stretched across the fixed frame. Then we shall have two systems of spider lines, one movable and the other fixed. The relation of each to the other is measured by the turns of the screw.

To determine the exact position of the graduated circle, a filar micrometer O is attached to a microscope of the form shown in Fig. 5, and the latter is finally fastened to a fixed frame in such a position that, when the ob-

FIG. 5.

alongside of each other, as in Fig. 2; then, the observer, by moving the cross-threads from one star to the other, and measuring the amount of the motion, can determine the angular distance between the stars, and their relation to each other. This is done by a micrometer, one kind of which will now be described.

server looks into the microscope, he sees the graduations on the circle magnified as many times as necessary, and also the threads of the micrometer. The microscope being fixed remains at rest while the circle turns. If the instrument were geometrically perfect in every respect, one reading microscope would answer

ASTRONOMICAL INSTRUMENTS

1 Six-inch steel Meridian Circle, U. S. Naval Observatory, Washington, D. C.
2 Steel Micrometer for six-inch Transit Circle.

the purpose; but, as the circle cannot be centred with mathematical exactness, pairs of microscopes are used which are at opposite ends of diameters of the circle. For example, when the graduation $15^{\circ} 20'$ is brought under one microscope, the graduation $195^{\circ} 15'$ would be under the opposite one. It is customary, for greater precision, to have two such pairs at right angles to each other, or four microscopes in all.

To determine the position of the circle, and hence the direction in which the telescope attached to it points, the observer looks into one of the microscopes and fixes upon some graduation of the circle, turns the micrometer screw till a spider line, or the middle of a pair of lines is central on the graduation, and then reads the indication of the head of the screw. It will be noticed that in Fig. 5 the mark 21° is central under the microscope. By pointing his telescope on one star after another and reading the microscope in this way, noting on each occasion what graduation is read, the distance through which the telescope is moved, and therefore the angles between the stars, are measured with the highest precision.

The Clock.—The astronomical clock does not differ greatly in its construction from the ordinary clock. Its arrangement and the numbers on its face are, however, adapted to the measures of time used by astronomers. Mean solar time, which is the time we make use of in the affairs of daily life, is also used by the astronomer with a slightly different arrangement. Instead of the hours being designated as A.M. and P.M., the astronomer counts through the whole 24 hours. Moreover, the count does not begin at midnight, but at noon, which is therefore the commencement of the astronomical day. For purely scientific purposes this is the natural time to begin the day, because it is determined by the passage of the sun across the meridian. Therefore, any day of the month, as used by the astronomer, continues until noon of the following day, when a new day begins. For this reason the hour hand of his clock only makes one revolution in the 24 hours, the hours being numbered from 0 to 23. The astronomer makes use of a second system of time, entirely different from that used in daily life, being based on the apparent diurnal movement of the stars. We have explained, in the preceding article (ASTRONOMY) that the time between two passages of the same star over the meridian of a place is not quite 24 hours, but nearly four minutes less. This is the true time of rotation of the earth on its axis, because, in consequence of the advance of the earth in its orbit it must go through a little more than its true revolution in order that the meridian of any place on its surface—that of Washington for example—may again pass directly under the sun. The astronomer therefore uses a "sidereal day," which is shorter than the day determined by the sun in the proportion $365.24:366.24$. This day is divided into 24 sidereal hours, and each hour into sidereal minutes and seconds, according to the usual system. A sidereal clock is regulated so as to gain about 3 m. 56 s. every day on our ordinary clocks and, in this way, keep time with the apparent diurnal movement of the fixed stars. It is so set that it shall read 0 h., 0 m., 0 s. at the moment when the vernal equinox crosses the meridian. As any of us, by looking at the

clock, can tell, by the time of day, whether the sun is in the east, south, or west, so the astronomer, by his sidereal clock, can tell in what part of its apparent diurnal course any star may be situated. For examples, at 5 h. he knows that the constellation Auriga is on the meridian, and at 18 h. 30 m. that the beautiful Lyra is crossing the meridian.

The Chronograph.—There are two systems by which the astronomer notes the time of occurrence of an instantaneous phenomenon to a fraction of a second. On the older system, which is not without its advantages, the observer, looking at his clock, counts its beats until the occurrence of the phenomenon he is to observe. We may take, as an example, the occultation of a star by the moon. He sees the limb of the moon approaching the star until it is clear that, in a few seconds, it is going to pass over it and hide it from view. Then, looking at the clock, he listens to the seconds, mentally counting the number of each beat. At length, there is a certain beat of the clock when the star is not yet hidden, while before the next beat the star has disappeared from view. He estimates how many tenths of the interval between the beats of the clock had elapsed when the star disappeared, and records the hours, minutes, seconds, and tenths in his note-book. The skilled observer will seldom be more than a few tenths of a second in error in this estimate. It requires long practice, and much natural aptitude, to be able to make an accurate observation in this way. The method has also the inconvenience that there is no permanent record except that which is written down at the moment, so that, if the observer has made an error of any kind, he has no direct way of detecting it except by subsequently discovering that something must be wrong. This difficulty is avoided by means of a chronograph. In the form commonly used, the chronograph consists essentially of a cylinder, generally about eight inches in diameter and one or two feet in length, revolving on its axis by clock work at the rate of one turn a minute. Around the cylinder is stretched a sheet of paper, which is carried with it in its motion. The sheet is pressed by a pen, pencil, or other point, so as to leave a mark on the paper as the cylinder revolves. The pen is carried by a little carriage moving slowly forward from one end of the cylinder to the other at a rate of about one tenth of an inch, or a little more, in a minute. Consequently, the point describes a spiral line on the paper as the chronograph goes through its successive revolutions, until the pen arrives at the farther end of the cylinder. This may take a period of two, three, or four hours, according to the adjustments. The pen is connected with an electro-magnet, the current around which passes through the works of the clock. The arrangement is such that at every beat of the clock, or sometimes at every alternate beat, the electric current is either closed or broken. With each closing or breaking of the current a slight motion is given to the pen so that the seconds are marked on the paper on the revolving cylinder. The same or another current also passes through a key held in the hand of the observer. When the latter sees the moment of the phenomenon he is to note approaching, he holds the key in his hand, and presses it at the exact moment to be recorded. A motion is thus given to the pen, and the posi-

ASTRONOMY

tion of the signal on the paper among the signals given by the clock shows the moment to a fraction of a second at which the signal was given.

FIG. 6.

Different systems are used based on this general principle. There are various ways in which the pen marks the clock beats on the paper. In that mostly used in this country the pen is not raised from the paper, but is given a sudden lateral jerk, producing a notch in the line, as shown in Fig. 6, which is a copy of a small portion of a chronograph record. On another system the pen simply makes dots on the paper at each beat of the clock. Sometimes the current passes around the electric magnet all the time except at the instant a signal is made. Then one and the same electric circuit is used for both the clock and the observer. Sometimes the clock only makes the circuit at the moment of its beat; then the circuit at the command of the observer is a second one, which he makes by pressing the key. The main point in all systems is that the beginnings of the minutes all come under each other so that, by taking the sheet off of the cylinder, and spreading it out, writing in the minutes and the lines of seconds, the observer can determine the exact moments at which every one of any number of signals were made while the chronograph was running. For example, in Fig. 6 it will be seen that the observer pressed the key at 12 m. 3.5 s. and again at 13 m. 2.4 s.

The Spirit Level.—Another appliance much used in astronomy is the spirit level. It serves to set the axis of an instrument exactly horizontal. It consists of a glass tube, generally six or eight inches long, of which the rounded surface is not a perfect cylinder, but is formed by the revolution of the arc of a very large circle around its chord. The tube is therefore of the shape shown in Fig. 7, slightly larger in the middle part than at the two ends. The amount of bulging is, however, so slight that the eye cannot perceive it. In the most delicate levels, a section of the curved surface is an arc of a circle perhaps half a mile, more or less, in diameter. The tube is nearly filled with chloroform or ether. Water, or even alcohol,

FIG. 7.

is not liquid enough for the purpose. A small vacant bubble is left at the top of the cylinder, as shown at A B in Fig. 7. When this bubble is in the middle of the tube, the axis of the level is perfectly horizontal. The remainder of the level is sketched in Fig. 8, which shows the level completely mounted, so that it can be set

on the horizontal pivots of the instrument of observation. The true horizontality of the pivots is tested by reversing the level end for end, reading the position of the bubble at each

FIG. 8.

setting. Details need not be entered into at present, as we only wish to make the principle of the instrument clear. Nearly all instruments for astronomical measurement are made by putting together some combination of the devices we have described. The two combinations most used in astronomical observatories are the Meridian Circle or Transit Circle, which are the same in principle, and the Equatorial Telescope.

The Meridian Circle.—This instrument is used for two distinct purposes. One is the determination of the right ascensions of the heavenly bodies; the other the determination of their declinations. It will conduce to clearness to consider these two functions separately and begin with the instrument as adapted to the first purpose. In this form it is called the transit instrument and is shown in Fig. 9. It consists essentially of a telescope, mounted on a

FIG. 9.

horizontal east and west axis P Q, the horizontality of which is tested from time to time by a spirit level. As thus mounted it will be seen that the telescope cannot move out of the meridian; by turning it on its axis, its line of sight marks out the meridian. Consequently, if an observer looking into it sees a star, or

ASTRONOMY

other heavenly body, he knows that the star must be near the meridian. To make the observation more exact, a system of spider lines, shown in Fig. 10, is stretched across the focal

FIG. 10.

plane, as already described. The middle line is so adjusted as to mark the meridian with the greatest possible exactness. The result is that the observer, looking into the instrument, sees these spider lines, and he may also see a star moving toward the meridian by virtue of its apparent diurnal motion as shown in the figure, where it is about to cross the meridian line. Watching it with a key connected with the electric circuit of the chronograph in his hand, he taps the key at the moment the image of the star crosses each of the lines. The middle line marks the passage across the meridian. The other lines are used in order to secure greater exactness by taking the mean of all the transits across the separate lines. Thus, by pointing his instrument into any part of the meridian, the observer may determine the times by his sidereal clock at which any number of stars crossed the meridian of his place.

In order that the line of sight of the instrument may describe the true meridian, it is necessary that, when the instrument is turned in the proper direction, the line shall pass

FIG. 11.

through the celestial pole. This is effected by the following arrangement: In the course of its apparent diurnal motion, a star near the pole will cross the meridian of any place twice in the

course of a sidereal day, first above the pole and then below it. Let the dotted circle in Fig. 11 be its apparent diurnal circuit around the pole P. Let the vertical line M R be the true meridian passing through the pole, and the other line A B that marked out by the line of sight of the transit instrument, supposed not to be exactly in the meridian. Then the star will take a less time in passing around from A to B on the left than in the other part of its course from B to A. Therefore by observing the transit both above and below the pole, across the middle thread of the instrument, the observer determines whether the line of sight of the instrument passes east or west of the pole and may adjust it accordingly. It may be said that, in astronomical practice, no instrument is ever assumed to be perfectly adjusted. The clock of the astronomer is never assumed to be correct, nor his transit instrument to be in the true meridian. What he does is, assuming them wrong, to make his observations, determine the errors, and correct his observations accordingly. This is called "reducing" the observation. We have already explained that, when a star is exactly in the same hour circle with the vernal equinox, its right ascension is 0 h., 0 m., 0 s. Since the clock, assumed to be correct, then reads exactly 0 h., it follows that the star in question will cross the meridian at this time by the clock. Then, as the sphere revolves, the right ascensions of the stars are all equal to the sidereal time at which they cross the meridian. Thus the observer by noting these times, measures the right ascensions of the heavenly bodies. This system of using the clock instead of a divided circle for determining right ascensions constitutes one of the greatest advances ever made in astronomical measurement. It depends upon the perfect uniformity of the earth's rotation and the excellence with which a clock can be made.

The Meridian Circle is the transit instrument, just described, with one or two graduated circles on its axis of rotation. The method of using it, and determining the arc through which the circle has moved at any time has already been explained. The inquiring reader may wish to know how, by such readings, the astronomer can determine the declination of stars. If the celestial pole were a visible point in the heavens, this would be very simple; the observer would turn his instrument until it pointed exactly at the pole, and then read his microscopes. Then as one star after another crossed the meridian, he would make a similar pointing, reading his microscope for the transit of each star. The difference between the reading on the pole and that on the different stars, would show their distances from the pole. Subtracting each of these from 90° would give the declination of the stars as seen in the instrument.

But, unfortunately, the pole is not a visible point. The observer has therefore to refer his position to the direction of gravity, which is done by a very ingenious use of a basin of quicksilver. The basin is set on a firm support on the ground under the telescope, and the latter is pointed directly downward. The observer, by mounting up to the eye-piece and looking down, is looking perpendicularly into the basin of mercury. A combination of reflectors is then arranged in the eye-piece of the

ASTRONOMY

telescope so that he can, at the same time, see the threads in his eye-piece and the images of these threads as reflected from the basin of mercury. When a telescope is so adjusted that the image and the thread coincide, he knows that the line of sight of his telescope is truly vertical. He then reads the microscope of his circle and so determines what the reading of his circle is for the vertical position. He knows that if the telescope is pointed at the zenith, the reading will be different by exactly 180° . He thus determines the exact distance at which the heavenly bodies crossed the meridian north or south of his zenith. From this, the determination of the declination is, in principle, a simple matter.

The Equatorial.—One of the most important arrangements of nature with which the astronomer has to deal is the diurnal motion. This takes place so slowly that, in looking at the stars, we do not notice it unless we watch for some time. But, if we point a telescope at a heavenly body, it magnifies the diurnal motion as much as it does the object. The result is that such a body, seen in a fixed telescope, is continually traveling across the field of view, and the instrument has to be continually moved to keep up with it.

In order to avoid this inconvenience, it is necessary that, if measures are to be made upon the body, or if it is to be continuously studied, the telescope must move to correspond. This is brought about by mounting it upon an axis parallel to that of the earth, and therefore oblique to the horizon, called the polar axis. The inclination to the horizon must be equal to the latitude of the place. All great telescopes are thus mounted. The way in which this is done will be seen by the accompanying pictures of certain great telescopes, notably that of Chicago. In order to keep the telescope pointed at the object, it must be turned upon the polar axis by clock work, moving it steadily at a rate equal to the diurnal motion of the object observed. In reality, the telescope is then pointed in a fixed direction, the motion of the earth being simply neutralized by the clock work of the telescope carrying the latter in the opposite direction. The equatorial telescope must also have a second axis, called the declination axis, in order that it may be pointed at stars in different declinations. The direction is determined by circles attached to the telescope, which show, at any time, to what declination on the celestial sphere the instrument is pointed. By a combination of contrivances, the astronomer can point his telescope by day at any star bright enough to be visible in it; or, by night, at any object invisible to the naked eye, of which he knows the right ascension and declination. He first turns his telescope until one divided circle corresponds to the declination of the star, and then clamps it in that position. Then, looking at his sidereal clock, and taking the difference between the sidereal time and the right ascension of the star, he turns his telescope on the polar axis until the other circle shows the correct pointing. Then he starts the clock work which sets the telescope in motion, and looking into the eye-piece, sees the required object. Every large telescope is also supplied with a finder. This consists of a smaller telescope fastened to the larger one in such a way that the centre of the field of view is the same in both. But the finder has a lower mag-

nifying power, and therefore a much larger field. Looking into it, and recognizing the object he wishes to observe, the observer moves the telescope until the object is seen on the cross threads of the finder. Then he knows that it is in the field of view of the large telescope.

Application of Photography to Astronomy.—From the time that photographic methods were introduced, the idea of taking pictures of the heavenly bodies by such methods must have occurred to astronomers. About the year 1840, Prof. J. W. Draper of New York put this method into practice by taking a daguerreotype of the moon. Shortly after our present system of photography was devised, several American astronomers carried the experiment yet farther. Notable among these were G. P. Bond, first assistant and afterward director of the Harvard Observatory; and L. M. Rutherford of New York, who was the possessor of an excellent telescope, and brought the method to a high state of perfection.

The principle on which a photograph of a heavenly body is taken is extremely simple. A telescope is pointed at the body so that the image of the latter is formed in its focus. A sensitized plate is placed in the focus and exposed for the necessary time. This may be only a fraction of a second, or it may be several hours. Unless the exposure is very brief, it is necessary that the telescope shall be kept in motion, so as to follow the object in its apparent diurnal course. When the exposure is completed, the image is developed in the usual way. In photographing, the ordinary telescope, as used for eye observations, is not well suited to the purpose, for the reason that the chromatic aberration is not the same for the visual and for the photographic rays. It is necessary to have a somewhat stronger crown lens, or a weaker flint lens, if a telescope is to be used in photographing, than if it is to be used by the eye. But the necessity of having telescopes of the two kinds is now, to a certain extent, done away with by the use of sensitized plates which are especially sensitive to the visual rays. By putting in an absorbing screen, through which the rays must pass before they reach the focus, and which allows only the visual rays to pass, very accurate photographs can be taken by the plates. This defect is felt only in the refracting telescope. A reflecting telescope brings all the rays, of whatever color, to one and the same focus, and therefore may be used either for photographing or for seeing. Improvements made in recent times in the sensitiveness of photographic plates have given an enormous extension to this method in astronomy. It is now found that celestial objects completely invisible to ordinary vision can be photographed. While only a few thousand nebulae have been catalogued as visible to the naked eye, it is found that there are hundreds of thousands which admit of being determined by photography.

The latter is now employed for two distinct purposes. The first is simply that of forming a picture of the sky, or rather of the stars in the sky. For this purpose the best telescope is one as large as can conveniently be obtained, but of short focal length. A great enterprise in this direction was started in 1887 by an association of astronomers who met at the Paris Observatory, and put into operation a plan of photographing the entire heavens on from 10,000

ASTRONOMY

to 20,000 plates, each two degrees square. This work is now approaching completion, and is intended to form a permanent record of the starry heavens, as they are seen in our times. A similar object is reached on a different system at the Harvard Observatory. There photographs are being constantly taken with telescopes much shorter than those used for the international chart. In this way new stars are from time to time discovered, and variations in the light of different stars are brought out. The other purpose is that of exact measurement. When the astronomer had to determine the respective distances of stars in the same field of view, he has hitherto generally depended on the filar or other micrometer. The use of this instrument is laborious. When the photographic method is used, he simply takes a picture of the stars he wishes to measure, and, at any convenient time, places it under a measuring engine supplied with sliding microscopes, and measures off the distance on his negative. The result of these two applications is that photography is now slowly supplanting eye observations in an important fraction of the astronomical work of the world.

SIMON NEWCOMB, LL D.,
Washington, D. C.

Astronomy, Theoretical. This branch of the science grows out of the great discovery of Newton, that the motions of the heavenly bodies, especially those of the solar system, are determined by their mutual gravitation. The results of this theory are now worked out by purely mathematical methods with a degree of precision scarcely attainable in any other branch of science. The adopted method consists first in expressing the attraction or pull experienced by each body from all the others in the form of differential equations. These equations express, in the most general way, the acceleration which the planets experience at every moment from the attraction of the other bodies. We do not write them because they would be understood only by a reader expert in the calculus, who, if he desires to be acquainted with them, will consult special treatises. It will suffice to say that there are three differential equations for each planet, which express the attraction, and its effect on the motion of the planet at any instant, in the direction of three co-ordinates. The problem then becomes the purely algebraic one of integrating these equations. The result of this process is that the effect of the attraction or pull upon the body, through a period of days, years, or even centuries, is summed up with great exactness, so that the motion of the body through the whole period can be expressed by algebraic equations. The simplest case occurs when there are only two bodies. The integration shows that, in this case, the bodies revolve round their common centre of gravity in orbits each of which is an ellipse. Commonly it is necessary to consider only the motion of the smaller of the two bodies, the motion being defined as if the larger were at rest. This is the case of a planet revolving round the sun, or of a satellite round its primary. It is then found that the orbit described by the revolving body round the great central body is an ellipse having the latter in one of its foci. The motion is also found to be subject to two other laws which bear the name of Kepler, their first discoverer. One of these is that the radius vector,

that is to say, the line drawn from the central body to the other sweeps over equal areas in equal times. The result of this is that if A B be the orbit having the sun, S, in the

FIG. 12.

focus; and if we mark on the orbit the points *a*, *b*, *c*, etc., which the planet passes through at any equal intervals of time, and then draw lines from each of these points to the sun, the areas included between these lines will all be equal to each other. A glance is sufficient to show that the nearer the body is to the sun the more rapidly it must move.

The position of the orbit and the place of the body in it are determined by six quantities called *elements*. Two of these elements express the position of the plane in which the ellipse lies, and therefore in which the planet moves. These are the inclination of the plane of the orbit to some other plane taken as that of reference. For the latter is commonly adopted the plane of the ecliptic, in which the earth revolves round the sun. When the inclination of the orbit of any other planet is spoken of, the astronomer means the angle which the plane of its orbit makes with the plane of the ecliptic. The other of the two elements expresses the line passing through the sun along which the two planes intersect. This is called the Line of Nodes. The position of the node is defined by the angle, as seen from the sun, between the vernal equinox and that node where the planet crosses from the south to the north side of the ecliptic. Three other elements determine the size and form of the elliptic orbit, and its position in its plane. The semi-major axis, A B, of the ellipse is called the mean distance of the planet from the sun, it being half the sum of the greatest and least distances. The other of these elements is the eccentricity of the orbit, which is equal to the quotient obtained by dividing the distance of the sun, O S, from the centre of the orbit by O A, the semi-major axis. These two elements completely determine the ellipse. The exact position of the ellipse in the plane may then be defined by the angle which the semi-major axis, O A, makes with the line of the nodes. It will be seen that the point A is that at which the planet is

ASTRONOMY

nearest to the sun. This is called the perihelion of the orbit if the central body is the sun; if the earth is the centre, the perigee. The opposite point, B, where the planet is most distant, is called the aphelion, or apogee. Finally, the sixth element is the position of the planet at some given moment of time.

The time of revolution of the planet is given by Kepler's third law, which is that the squares of these times are proportional to the cubes of the major axes of their orbits. For example, let one planet be four times as far as another from the sun. The cube of 4 is 64. The square root of this is 8. It follows that the planet which is four times as far will be eight times as long in completing its circuit. If the outer planet went as rapidly as the other, it would be only four times as long. Its orbital motion is therefore, on the average, only about half as rapid.

In theoretical astronomy a unit of distance is necessary. Our ordinary units do not well serve the purpose of the astronomer for two reasons. They are too short for the great distances he has to measure, and the magnitude of the heavens in terms of miles is not known with sufficient exactness to make that measure convenient. What the astronomer does therefore is to take the mean distance of the earth from the sun as his yardstick, and to express the distance of all the bodies of the solar system, both from the earth and from each other, the moon sometimes excepted, in terms of this unit.

From the laws of motion based on gravitation may be derived several interesting theorems. Finally, suppose, that at some point in the solar system,—we may take, to fix the ideas, a point at the mean distance of the earth from the sun,—a number of bodies are projected in different directions, but all with the same velocity. Then, the equations of motion show that the major axes of the orbits which these bodies describe will all be equal. Then, from Kepler's third law it follows that the times of revolution will also be equal. Consequently, at the end of a certain period the bodies will all return at the same moment to the point from which they started. This period will depend only on the velocity with which the body is projected. There is a certain velocity, called the circular velocity, which is such that if the bodies are projected in a direction at right angles to that of the sun, they will describe circular orbits. If all the bodies are projected in different directions with this same velocity, they will all be exactly one year in getting around and returning to the starting point. Now suppose that, instead of the bodies being projected with this circular velocity, which is very nearly that of the earth in its orbit, they are projected with a somewhat smaller velocity. Then, the less the velocity the less the major axis of the orbit, and the greater the velocity the greater the major axis. A body projected with a speed one-third greater than that of the earth would fly out beyond the orbit of Jupiter. A slightly greater speed would carry it beyond the orbit of Neptune, the reason being that, as the body recedes, the attraction of the sun diminishes at so rapid a rate that the weak attraction left is not sufficient to overcome the slight surplus velocity. Finally, if the speed is equal to that of the earth mul-

tiplied by the square root of 2, that is to say, about 26 miles per second, the body will never return. The ellipse in which it should move is stretched out into a parabola, still having the sun in its focus. If the velocity is greater than this, the parabola will be still farther changed into a hyperbola. Then the body would fly out into the stellar spaces, perhaps in the course of millions of years reaching some other sun, but would certainly never return to our system. Another theorem is that the velocity, no matter what the form of the orbit, diminishes as we go out from the sun in proportion to the square root of the distance. Thus we have already seen by Kepler's third law, when we found from that law that a planet four times as far from the sun would move only half as fast. Thus the parabolic velocity is less the farther a body is from the sun. At the planet Uranus it is less than six miles per second; at that of Neptune, about five miles per second. Still another theorem is that if a planet moving in a circular orbit were stopped at any point of its motion, and then were allowed to drop toward the sun, the time of reaching the sun would be equal to that of revolution divided by the square root of 32. It follows that if the earth should be stopped in its motion, it would drop to the sun in a number of days found by dividing 362.24 by the square root of 32. This would be nearly 64 days.

The orbits of most of the large planets are nearly circular. For particulars relating to them see SOLAR SYSTEM. The orbits of comets are, however, mostly parabolas, or ellipses which cannot be distinguished from parabolas when the comet is near enough to the sun to be visible. It is probable that many of those orbits which are ellipses have become so through the comet at some time in its history passing very near a planet. (See COMET.) One of the problems of theoretical astronomy which the astronomer often meets with is that of determining the orbit of a newly discovered body of the solar system. Three complete observations of such a body, that is to say, three observations each of which determines exactly the apparent position of the body on the celestial sphere, enable the astronomer to determine the orbit in which it is moving round the sun. The calculation requires from five to ten hours' work by an expert calculator having at his command the necessary tables. The first orbit thus computed may be considerably in error, because the effect of errors of observation is multiplied many fold, unless the planet has moved through a considerable arc of its orbit between the times of observation. But the longer the planet is observed, the more exactly the elements of its orbit can be determined. It is found that when two stars are so near each other as to be kept together by their mutual attraction, they revolve around each other in an elliptic orbit. It follows that the law of gravitation extends to these systems. Thus the calculations of the theoretical astronomer are not confined to the solar system, but may be extended to the fixed stars.

In all that precedes we have considered only the motion of two bodies, the smaller of which moves around the larger in an elliptic orbit. But, as a matter of fact, every planet of the solar system is acted upon not only by the great central body, but by every one of the other

ASTRONOMY

planets. The result is that the actual orbit, although very nearly an ellipse, deviates slightly from it, and the motion is not exactly in accordance with Kepler's laws. The problem of taking account of these additional forces is an extremely complicated one, in which success has been reached only by successive generations of the ablest mathematicians devoting long years of study and calculation to the subject. While the solution, even to-day, is far from complete, it has been so far advanced that it is possible to prepare tables of the motions of the planets which shall hold good for generations, and even for centuries. The method in which the problem can best be solved was devised by Lagrange, who flourished in France toward the latter part of the 18th century. The fundamental idea of his method was that the motion of the planet at every instant should be represented by an ellipse, but this ellipse continually changes its form and dimensions so as to fit in with the actual motion of the planet under the influence of the attraction of all the other planets. Some idea of the case may be imagined by supposing a cord of some light material made into an ellipse very nearly a circle, and left to float on the waves of the ocean. Then we should see the cord, while still remaining almost in its original shape, continually bending and twisting as it was moved by the waves. So does the variable ellipse in which the planet moves. It is exactly defined by supposing that, at any one instant, the attraction of all the other bodies, the sun excepted, ceases. Then the planet would move in a fixed and unchangeable ellipse. This ellipse is taken as that which corresponds with the motion of the planet at the instant. At a second instant the planet would actually have deviated slightly in consequence of the attraction of the other planets, but there would still be a corresponding ellipse, but somewhat different. So the ellipse goes on changing continually.

When these changes are subjected to the rigor of mathematical formula, it is found that they nearly, but not quite, compensate each other in the long run. Let us take, for example, the eccentricity of any one orbit. This will vary in the course of every revolution of the planet, and may come back to its original amount any number of times. But, if we watch it revolution after revolution, we shall find that, in the long run, it continually increases or diminishes. It is thus found that the eccentricity of the earth's orbit has been diminishing through all historic times, and this diminution will go on for 43,000 years to come. Moreover, the general rule is that the perihelion of the planet is gradually moving forward. In the case of the earth's orbit the motion is such as would carry it all the way round the circle in 200,000 years. The inclinations and longitudes of the nodes are also varying in the same way. These variations, which go on century after century, are called secular variations, while those which are compensated from time to time are called periodic. Now, the most interesting and important question of celestial mechanics is whether the secular variations will continue forever in the same direction. The profound analysis of Laplace and Lagrange shows that such will not be the case so far as the eccentricities are concerned.

At the end of immense periods the direction will be reversed. It is now known that the diminution of the eccentricity of the earth's orbit after continuing for about 43,000 years will change to an increase for a certain period. It is thus with all the orbits; the motions go through a series of oscillations having periods of hundreds of thousands of years—like "great clocks of eternity which beat ages as ours beat seconds." The precision with which the astronomer is now able to predict the motions of the heavenly bodies is reached by a combination of mathematical computations of the most difficult and complicated character, with the most refined observations upon the positions of the moon and planets, year after year.

The most complex of all the problems is that of the moon's motion around the earth, of which we shall mention some features. In this case the central body, the earth, is vastly smaller than the sun. But, owing to the great distance from the sun and the consequent small difference in the force of its attraction upon the earth and moon, it happens that the moon revolves around the earth in an orbit which approximates to an ellipse. But the changes and motions in this ellipse are much larger and more rapid than in the case of the planets. For example, the perigee of the moon's orbit makes a revolution round the earth in eight years, while the node on the ecliptic makes a revolution in 18.6 years. The moon also makes two swings back and forth during the space between two full moons, and the eccentricity and perigee both make an annual swing, all owing to the action of the sun. See MOON.

The principles of theoretical astronomy, and the operations of practical astronomy are combined in one of the greatest achievements of the human intellect—that of measuring the heavens and weighing the planets, and, in a few cases, even the fixed stars.

The distance of the moon is determined in two ways, the results of which agree within the necessary range of uncertainty of the methods. One is by the measurement of the moon's parallax, taking as the base line two distant observatories, Greenwich and the Cape of Good Hope. (See PARALLAX.) The other method consists in determining exactly what ought to be the size of the moon's orbit in order that she may make her revolution around the earth in the time that she actually does. The probable error of the distance of the moon at any time, as determined in this way, is not more than 40 or 50 miles.

The proportions between the orbits of the several planets are known with the greatest exactness from their observed times of revolution, and from Kepler's third law. It follows that if we can get the exact distance of any one planet at any one time, all the other distances in the solar system may be derived by the known proportion. The fundamental quantity which is used as a unit of measure is the distance of the sun. This distance has been determined by four completely separate and independent methods, the agreement between which illustrates the great exactness of astronomical theory.

The first method is by measures of parallax. The application of this method is fully described in the article PARALLAX. It requires that the apparent direction of a planet among the stars

ASTRONOMY

be observed with great exactness from two far distant points of the earth's surface, or at two times of day during the interval between which the observer is carried around by the rotation of the earth. These observations have to be on a planet and not on the sun, because the latter, owing to the brilliancy of its light, cannot be measured with the necessary precision. The most celebrated way of determining parallax has been by observing transits of Venus (q.v.). But these occur at such rare intervals, the last having been in 1882, and there being no other to occur during the 20th century, that the measures have to be made on other planets which approach nearest to the earth. For this purpose Mars has sometimes been used, because it occasionally approaches us within less than half the distance of the sun. But the most exact observations can be made on some of the minor planets at the time of their nearest approach.

The second method is by the velocity of light. This method is, in principle, the most simple and elegant of all. It rests on the fact that it is possible, by two kinds of observation, to determine how long it takes light to pass from the sun to the earth, or to cross the earth's orbit. If then we can determine by measures on the earth's surface how fast light travels, it follows that by multiplying this velocity by the time it takes to travel from the earth to the sun, we shall have the distance of the sun. The velocity of light has actually been determined with great precision by means of the revolving mirror. (See LIGHT, VELOCITY OF.) The result is a speed of 186,300 miles per second. The time required for light to cross the earth's orbit is much more difficult to determine. The only way in which a direct determination can be made is through observations of the eclipses of Jupiter's first satellite. By comparing the times of these eclipses through a long series of years when Jupiter is at various distances from the earth, it is found that the eclipses are seen later, the farther Jupiter is from the earth at the time. This is because light requires time to travel over the different distances. But the determinations made in this way are not very exact, because such eclipses take place so gradually that it is impossible to fix upon a precise phase without a possible error of several seconds. All we can say as a result of this method is that it takes about 4 m. 20 s. for light to pass from the sun to the earth.

A more exact result is reached by measuring the displacement of the fixed stars produced by aberration. As the earth makes its annual course around the sun, the position of every star in the heavens is, at every moment, slightly displaced toward the direction in which the earth is, at the moment, moving. This is due to the proportion between the velocity of light and the speed of the earth in its orbit. Unfortunately, the speed is so great that the displacement in question is only about 20.5"; an arc too small to be determined with the precision that is desirable. Still, the observations available are so numerous that the result, 20.525", found by Chandler, is probably within one, or, at most, two hundredths of a second of the truth. Accepting Chandler's number, light requires 500 seconds to pass over the distance which separates the sun from the earth. Multiplying this by the speed of light, we have, for the distance

of the sun $186,300 \times 500 = 93,150,000$ miles as the distance of the sun.

The third method is a very recondite one, because it rests on the mathematical principles of celestial mechanics, applied to the case of the earth's motion around the sun. It requires, in advance, an exact determination of the ratio of the mass of the sun to that of the earth. This is best found by observations of Venus, which now extend through more than a century and a half, by which the motion of the node of Venus on the ecliptic is determined. This motion is due principally to the attraction of the earth; and from it the proportion between the mass of the earth, and that of the sun is determined. The next step requires a comparison between the distance which a body falls at the surface of the earth from its own gravitation, and the fall of the earth toward the sun as shown by the curvature of its orbit. By combining these various ratios, the distance of the sun is calculated. The fourth method also rests the theory of gravitation. One consequence of the sun's action on the moon is that the latter falls behind about two minutes in its monthly course near the time of the first quarter, and is ahead by the same amount near the last quarter. Knowing the exact amount of this swing, the distance at which the sun must be placed in order to produce it is determined. Each of these four methods has its strong and its weak points; and there is no one of them so much better than all the others that we can rely upon it exclusively. Still, their agreement affords a remarkable proof of the accuracy of astronomical theory, and of the precision with which astronomical measures are made under such difficulties as the observer and computer have to encounter. The astronomer does not use the distance of the sun in his computations, because, as already remarked, this is simply his unit of length. What he actually uses is the sun's parallax; this is equal to the angle which the equatorial radius of the earth subtends when seen at a distance equal to that of the sun. The latest results for this parallax from the four methods are the following.

First method, parallax, 8.802".
Second method, light, 8.779".
Third method, mass earth, 8.762".
Fourth method, moon, 8.773".

The general conclusion which we reach is that the distance of the sun is very nearly 93,000,000 miles, probably a little more, rather than a little less.

What may seem a yet more wonderful result of celestial measurement is the weighing of the planets and other heavenly bodies. This requires very complex mathematics. But, after all, the principles on which the method rests can readily be made clear. In the case of the planets, there are two methods, one of which can be applied only when a planet has a satellite moving around it. We have already seen that the motion of every planet which, were there no other planet, would take place in an ellipse having the sun in a focus, is changed by the attraction of the other planets. The observation of the deviations, when carefully measured through many revolutions of a planet, enable the mathematical astronomer to compute the ratio of the mass of each attracting planet to that of the sun. This ratio is all that the astronomer requires for his ordinary work.

ASTROPALIA—ASYLUM

When the planet has a satellite, its mass can be determined with much more ease and simplicity. The measurement of the distance of the satellite from the planet, carried through a great number of revolutions of the former, enable the astronomer to determine the ratio between the distance of the satellite from the planet, and that of the earth from the sun. Combining this with the time of revolution of the planet, a proportion is shown between the mass of the planet and that of the sun by a law of the same form as the third law of Kepler. The masses determined by astronomical methods are all expressed by taking the mass of the sun as the unit. To translate the result into our ordinary measures of weight, we must know the mass of some one body, say the earth, in pounds or kilograms. How this is done is set forth in the article GRAVITATION.

SIMON NEWCOMB, LL.D.,
Washington, D. C.

Astropalia, or **Stampalia**, an island of the Ægean Sea, belonging to Turkey, 77 miles west-northwest of the island of Rhodes. It has a length of 13 miles and an area of 50 square miles. Its ancient name was *Astypalæa*.

Astrophyl'ite, a mineral crystallizing in the orthorhombic system, and consisting of an orthosilicate of iron and manganese, combined with titanium, sodium, and potassium. It is yellow and strongly pleochroic. It has a sub-metallic pearly lustre, a hardness of 3, and a specific gravity of from 3.3 to 3.4. It occurs at Brevik, Norway, at Kangerdluarsuk, Greenland, and near Pike's Peak, Col. Its name signifies "stellate leaf," the allusion being to the stellate way in which its crystals are sometimes arranged.

Astruc, *as'truk'*, **Jean**, French physician: b. 19 March 1684; d. Paris, 5 March 1766. He acquired high reputation as an anatomist, and was the author of 'Venereal Diseases' (1736), and other medical works. The work, however, which has immortalized him is purely theological and is entitled 'Conjectures as to the Original Materials of Which Moses Seems to Have Availed Himself in Composing the Book of Genesis' (1753). In this he divides the book of Genesis into two parts, on the ground of the use of *Elohim* (God) or *Yahveh* (Jehovah). He holds that these two names for the Deity point to the fact that Genesis was compiled from two parallel, independent documents. His memoir forms the origin of modern criticism on the Pentateuch.

As'trup, **Eivind**, Norwegian explorer: b. Christiania, 1870; d. 1896. He was a member of the first and second Peary expeditions, 1891 and 1893, and made the first survey of the northern coast of Melville Bay. He perished while on a snowshoe expedition from Dovre, Norway.

Astulphus, **Aistulf**, or **Astolf**, king of the Lombards in 749-56 A.D. He conquered the exarchate of Ravenna in 752, but was deprived of it in 755 by Pepin the Short.

Astura, *äs-too'ra*, a maritime village of Italy, 40 miles from Rome. In its little harbor a high tower is said to stand on the site of the villa of Cicero, where Cicero was slain by order of Antony 43 B.C.

Vol. 2—8

Asturias (*as-too'ria*), **The**, a former principality of Spain. To this mountainous country of the north of Spain the Goths retreated in the 8th century before the sword of the Saracens. The inhabitants of Asturia are said to be less industrious than the Galicians, and less sociable than the Biscayans. The hereditary prince of Spain has borne since 1388 the title of Prince of Asturia, or of the Asturias, according to the obsolete division into Asturia de Oviedo and Asturia de Santillana, Oviedo and Santillana being the two chief cities of the principality. Since 1838 the principality has been officially known as the province of Oviedo. See OVIEDO.

Asty'ages, the last king of Media, reigned 594-559 B.C. In the latter year he was dethroned by Cyrus, who, according to Herodotus, was his grandson. Cyrus revolted in 559, and defeated Astyages, whom he took prisoner, but afterward appointed governor of Hyrcania.

Asuncion, *ä-soon'the-ön*, or **Nuestra Señora de la Asuncion** (in English, *Assumption*), the capital of Paraguay, on the river Paraguay. The principal edifices are the cathedral, several other churches and convents, the president's palace, house of congress, arsenal, custom-house, a college, hospital, railway station, etc. The trade of the town is in Paraguay tea, tobacco, fruits, hides, timber, provisions, manufactured goods, etc. Steamers and sailing vessels ply on the river. The town was founded on the feast of the Assumption in 1537, hence its name. Pop. (1900) 51,700.

Asurnazirpal, *ä-soor-na'zer-pal*, a king of Assyria from 881 B.C. to 860. He was one of the most warlike of Assyrian kings, and in numerous campaigns enlarged his empire, especially toward the westward, extending it from Lebanon to the Tigris. He also rebuilt Calah, his capital, and left a record of his achievements in the so-called 'Standard Inscription.'

Aswal, *äs'wāl*, a Hindu name of the sloth-bear (q.v.).

Asylum, a place where persons flee for protection. Under the Mosaic dispensation cities of refuge were set apart to which the slayer might flee so that innocent blood should not be shed, in case the person was not worthy of death—that is, in case the act was accidental and not malicious. But among the ancients, outside of the Jews, it seems that temples, statues to the gods, and altars particularly consecrated for such purposes, constituted places of refuge for persons generally, and it was deemed an act of impiety to remove, forcibly, one who had fled to such an asylum for protection. However, Tiberius abolished all asylums except the temples of Juno and Æsculapius. These asylums finally passed over to the Christian world, and under Constantine the Great, all Christian churches were made asylums for all those who were pursued by officers of justice or the violence of their enemies, and the younger Theodosius, in the year 431, extended these privileges to all courts, gardens, walks, and houses belonging to the Church. In the year 631 the Synod of Toledo extended the limits of asylums 30 paces from every church, and this privilege afterward prevailed in Catholic countries, and it is said to have been a strong armor of defense against the wild spirit of the Middle Ages, and

ASYLUM — ATAHUALPA

not without good consequences at the time when force often prevailed against justice. But in later times as other and better systems of procedure in the administration of justice became adopted, asylums were abolished in most countries. This seems to have been the origin, nature, and object of asylums, and such the common acceptance of the term, but more recently in some countries, the name has been given to institutions for the protection and care of the poor, blind, deaf and dumb, and lunatics who are incapable of taking care of themselves.

Asylum, Right of, in international law, the right which forbids one government to apply its laws to its own or its enemy's subjects when they are within the jurisdiction of another government. Most commonly this right is accorded to a foreign legation to shelter persons subject to the jurisdiction of the state where the legation is situated. It is universally conceded that the right of asylum is not to be applied in the case of ordinary criminals, but it is usually made use of for the protection of political offenders.

Asymmetric (as-i-met'rik) **System**, in crystallography, the crystal form now more commonly called "trilic." It was called asymmetric because it has no plane of symmetry. See CRYSTAL.

Asymptote, äs'im-tôt (from three Greek words, meaning "not to fall with" or coincide), a term used in geometry to designate a line which continually approaches another line, but never meets it, however far either of them may be prolonged. At least one of the lines must be a curve. Though the very existence of such a line seems paradoxical, it can be demonstrated on the strictest mathematical principles, as in the case of the hyperbola and its directrix. The term first occurs in the conic sections of Apollonius.

At Odds, the title of a novel by the Baroness d'Aulphœus (1863), dealing with the vicissitudes of a Bavarian family during the stormy epoch from Hohenlinden to Wagram. It is told with a happy ease and directness; and if it has not the brilliancy of 'The Initials,' is not less clever as a study of character.

Atacama, ä'tä-ka'ma, the name, formerly, of two South American provinces: (1) A northern province of Chile, with an area of 28,380 square miles, and a population (1895) of 59,713. About 1,000 silver and 250 copper mines are worked, and gold is also found in considerable quantities. Salt deposits cover sometimes 50 square miles. Copper, to the value of over \$7,500,000 annually, is the chief export to England. Capital, Copiapo. (2) A Bolivian Department, which formerly extended as far north as Peru, and east to Argentina. All that part of the district west of the Andes was ceded, in 1884, to the Chileans, and formed into the Department of Antofagasta, with an area of 60,770 square miles. The recently discovered mines of Caracoles are said to be the most productive silver mines in the world. The former capital, Cobija (pop. 2,380), was long the only port in the district; but the rival port of Antofagasta, founded in 1870, had by 1894 attained a population of 7,946.

A'taca'ma, a desert region on the west coast of South America, formerly belonging partly to Bolivia, partly to Chile, but now belonging wholly to the latter. It lies between the Andes and the sea and much of it at the height of 3,000 to 5,000 feet above the sea. The desert of Atacama proper, a tract almost entirely destitute of water and vegetation, lies partly in the Antofagasta territory of Chile, partly in the province of Atacama. The soil consists of stones and gravel, and the surface is diversified with many mountains. The Salina of Atacama, a salt morass, mostly dried up, has a surface of 1,084 square miles, and lies at the height of over 7,000 feet.

Atacamite, -tak'-, a mineral, originally found as sand in the Atacama province, in northern Chile. It is essentially a hydroxy-chloride of copper, having the formula $\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$. It crystallizes in the orthorhombic system, and has a hardness of from 3 to 3.5, and a specific gravity of 3.76. Atacamite is green in color, and commonly occurs in masses of slender prisms. A coating having the same chemical composition is formed on metallic copper, as the result of prolonged exposure to sea-water or air. Atacamite exists in considerable quantity in various parts of South America, and in Australia; and has been used to some extent as a source of copper. In the United States it is found very sparingly at Jerome, Ariz., and elsewhere.

Atahualpa, a'ta-wal'pa (*atahu*, Latin *virtus*, and *allpa*, sweet), a Peruvian Inca (see INCA SEMI-CIVILIZATION and PERU). His brother Huascar succeeded Huayna Capac; but Atahualpa obtained the kingdom of Quito, and a civil war broke out between the brothers; though the details are not accurately known, it appears that when Pizarro was beginning to move inland Huascar had been defeated and thrown into prison, and Atahualpa had become Inca. Pizarro set out in September 1532, and made for Cassamarca, where the Inca was. On 15 November Pizarro entered Cassamarca, and sent to request an interview with the Inca. On the evening of the next day, Atahualpa entered the great square of Cassamarca, accompanied by some five or six thousand men, while Pizarro's artillery and soldiers were planted in readiness in the streets opening off the square. The interview was carried on by the priest Vicente de Valverde, through an interpreter. He stated briefly and dogmatically the principal points of the Christian faith and the Roman Catholic policy, and concluded by calling upon Atahualpa to become a Christian, obey the commands of the Pope, give up the administration of his kingdom, and pay tribute to Charles V., to whom had been granted the conquest of these lands. To this the Inca at first returned a very temperate answer. The priest retired, and Pizarro at once gave the signal for attack. The Spaniards rushed out suddenly, and the Peruvians, astonished and defenseless, were cut down in hundreds. Atahualpa, thus treacherously captured, offered an enormous sum of money as a ransom, and fulfilled his engagement; but Pizarro still detained him, until the Spaniards should have arrived in sufficient numbers to secure the country. While in captivity, Atahualpa gave secret orders for the assassina-

ATAKAPA — ATCHAFALAYA

tion of his brother Huascar, and also endeavored to raise an army to expel the invaders. His plans were betrayed, and Pizarro at once brought him to trial. He was condemned to death, and, as being an idolater, to death by fire. Atahualpa, however, professed himself a Christian, received baptism, and his sentence was then altered into death by strangulation. His body was afterward burned, and the ashes conveyed to Quito. Consult Prescott, 'Conquest of Peru.'

Atakapa, a'tā-kā'pā, the designation of an extinct cannibal tribe who occupied the west gulf coast of Louisiana.

Atala, a'tā'la', a romance of the American wilderness, by Châteaubriand, published in 1801. It is the extravagant and artificial but beautiful story of two lovers—a young Indian brave, Chactas (that is, Choctaw), and an Indian maiden, Atala.

At'alan'ta, the name of two heroines in Greek mythology. One was a native of Arcadia, celebrated for her skill in archery. She slew with her arrows the Centaurs Rhœcus and Hylæus, sailed to Colchis with the Argonauts, and was present at the chase of the Caledonian boar, which she first wounded; hence Meleager awarded to her the prize. She was renowned for her beauty and swiftness in running. She stipulated that every candidate for her hand should run a race with her, and if he conquered her she was his own, but if he was conquered he was doomed to death at her hand. Many had fallen victims in the attempt, when Meilanion, by the aid of Aphrodite, overcame her. The goddess gave him three golden apples, which he threw behind him, one after another, as he ran. Atalanta stopped to pick them up, and Meilanion reached the goal before her. She accordingly became his wife. The other Atalanta, who cannot very well be distinguished from the preceding, the same stories being told about both, is connected with Boeotia and Boeotian localities. She is said to have been married to Hippomenes. See Morris, 'Atalanta's Race.'

At'alan'ta in Cal'ydon, a tragedy by Algernon Charles Swinburne, published in 1864. It deals with a Greek theme, and employs the Greek chorus and semichorus in its amplification. To this chorus are given several songs, which exemplify the highest charms of Swinburne's verse—his inexhaustible wealth of imagery, and his flawless musical sense. The story is founded upon the hunting of the Caledonian boar.

At'aman. See HETMAN

Atavism (Latin *atavus*, originally "ancestor," later specialized as "great-great-grandfather") in biology, the reappearance in an organic being of specific ancestral peculiarities which have not appeared in intermediate generations, or of peculiarities of ancestral side branches not represented in the direct line. It is often loosely used as synonymous with reversion, but in strict scientific usage the latter is not the reappearance of single characteristics, and certainly not of abnormal ones, but the return in general type to the primitive type from which the special race was evolved. In this sense, it may be said that reversion is the extreme

backward limit of atavism. For example, the birth of a six-fingered child with a six-fingered grandfather or uncle but normal parents would be atavism; but the approach of human beings left on a desert island to the prognathous and hairy type of the simians, were it conceivable, would be reversion. Sometimes the two are hardly to be discriminated; thus, the appearance of a tail-bone or pointed ears would be an atavism recalling the primitive type, as are horses with toes, yet not quite a reversion. A true reversion is the banded pigeon which is a frequent "sport" among fancy breeds; and the still commoner mongrel "yellow dog," a reversion to the jackal type. Atavisms are part of the perpetual family wonders, the reproduction of minute special features, habits, tricks of behavior, even tastes and fashions of speech, characteristic of distant relatives or far-back ancestors, but perhaps obliterated for long periods. In sociology, especially criminology, the word is used precisely in the sense of reversion to primitive instincts and passions, supposed to be overlaid or suppressed by civilization. The criminal on this theory is a being who has lost his evolved characteristics, and gone backward to the primitive savage. This, however, has too many flaws to be scientifically acceptable.

Atax'ia, an irregularity of function, but the term is usually applied to incoordination of muscular movements. It is a phenomenon seen in many disordered states of the body and not confined to the one disease, locomotor ataxia. Thus, ataxia is a common symptom of alcoholic intoxication. Two forms of ataxia may be distinguished, static and motor. In static ataxia there is an irregularity in the maintenance of attitudes and positions. This form of ataxia is common in chronic cocaine poisoning and is present in some severe cases of chorea, or St. Vitus' dance. The patients' limbs seem to give way beneath them and there is a restless irregularity in attitude and pose. Static ataxia is also a symptom in certain types of insanity, notably the disease termed catatonia. Motor ataxia is a much commoner form of this condition. In alcoholic intoxication it is well developed and the loss of control, largely due to diminution of the function of the sensory nerves, is too well known to need description. In a number of diseases of the nervous system ataxia of the muscles of the arms, lips, tongue, trunk, and lower limbs is a prominent symptom. Ataxia is to be distinguished from loss of the sense of equilibrium. See CEREBELLUM; CO-ORDINATION; EQUILIBRIUM; HEMIPLEGIA; LOCOMOTOR ATAXIA; SCLEROSIS.

Atbara, at-ba'ra (*Bahr-el-Agwad*, or Black River), an important tributary of the Nile. It rises in Abyssinia to the northwest of Lake Tzana, flows to the north, receiving several large tributaries, especially the Mareb and Tacazzé, and enters the Nile lat. 17° N.

Atchafalaya, äch'ä-fa-lī'ya, a river in Louisiana, an outlet of the Red River. It flows southward through Grand Lake, and enters the Gulf of Mexico by Atchafalaya Bay. Its length is estimated at 250 miles and it is supposed to have been formerly the principal channel of the Red River.

ATCHISON — ATHABASCA

Atch'ison, David Rice, American legislator: b. Frogtown, Ky., 11 Aug. 1807; d. 26 June 1886. He was educated for the bar, and began practising in Missouri, in 1830. He was elected to the legislature in 1834 and 1838; was appointed judge of the Platte county circuit court; and, in 1843, while holding this office, was appointed United States senator to fill a vacancy. He was twice elected to the last office, and during several sessions was president *pro tem.* of the Senate. During Sunday 4 March 1849, he was the legal President of the United States, as Gen. Taylor, the President-elect, was not sworn into office until the following day. Senator Atchison became conspicuous in the slavery debates and in the Kansas-Nebraska struggle, because of his strong pro-slavery views. The city of Atchison, Kan., was named after him.

Atch'ison, Kan., a city and county-seat of Atchison County; on the Missouri River and the Atchison, T. & S. F., the Burlington Route, the Chicago, R. I. & P. and the Missouri P. R.R.'s. It is an important commercial center, by reason of its excellent river and extensive railroad facilities, and has a wholesale trade of more than \$50,000,000 per annum. It exports largely grain, flour, live stock, and dressed meats, and has more than 50 important manufacturing establishments. There are gas, electric light, sewer, water and electric railway plants; several public parks; a noteworthy bridge across the Missouri River; an attractive union depot; three national banks; and daily, weekly, and monthly periodicals. Atchison is the seat of the State Soldiers' Orphans' Home, Well's Insane Asylum, Allaman's Hospital, Midland College (Lutheran) and St. Benedict's College (Roman Catholic), and has a public library, public high and graded schools, and a number of high graded private schools. Atchison was first settled in 1854 and was incorporated as a city in 1859. Pop. (1900) 15,722.

Ate, *ā'te*, among the Greeks, the goddess of hate, injustice, crime, and retribution. Expelled from Olympus she has ever since paced the earth with incredible velocity, and spread destruction and misery everywhere.

At'eles, a genus of South American monkeys of the division with long prehensile tails, to which the name *Sapajou* is sometimes collectively applied. The head is round, and the facial angle about 60 degrees; the limbs are remarkably long and slender, upon which account the English name of spider monkey is sometimes used as a generic designation; the fore-limbs are either destitute of a thumb or have a rudimentary one.

Ateles'tite, a native basic arsenate of bismuth, having the formula $3\text{Bi}_2\text{O}_3 \cdot \text{As}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$. It is yellow in color, and translucent with an adamantine lustre. It occurs in small monoclinic crystals, at Schneeberg, Saxony.

Ateliers Nationaux, *a-tě-līā' na'syō'nō'*, national workshops established by the provisional government of France in 1848. Previous to the outbreak of the revolution of Feb. 1848, there had been two years of scarcity, inundation, and commercial crisis. *Ateliers nationaux*,

or national workshops, were opened at once. The workmen were organized under lieutenants and brigadiers of their election. The number of applicants, including arrivals from the provinces, at length exceeded 100,000, and the total expense reached nearly 16,000,000 francs. The men were employed on roads, railways, earth-works, etc., but it was impossible to find work for the whole, and a great part of the labor was unprofitable. There were besides 30,000 to 40,000 women employed in preparing articles of outfit for the army, whose work left only a trifling loss. In June the Constituent Assembly resolved upon the immediate closing of the ateliers. This rash step provoked the insurrection of the Red Republicans (23d-26th June), suppressed by Gen. Cavaignac with fearful slaughter. In Lyons the ateliers were closed without disturbance, but in some other towns trouble was occasioned.

At'ella'næ Fab'ulæ (called also *Oscan plays*), a kind of light interlude between tragedy and comedy, performed by freeborn young Romans. This kind of a play is said to have originated in *Atella*, a city of the Oscans, between Capua and Naples, and is at the same time the beginning and all that remains of a national Italian comedy, consisting of farce seasoned by satire.

Atesh'ga (the place of fire), a place much revered by Persian fire-worshippers. It is on the peninsula of Apsheron, on the west coast of the Caspian, and is visited by large numbers of pilgrims, who bow before the sacred flames issuing from the bituminous soil.

Ath, at, a town of Belgium, 14 miles from Mons. It has important manufactures of linen, lace, cutlery, soap, and large hammers. It was formerly a fortress. Pop. (1900) 11,100.

Ath'a, a false prophet in the reign of the Caliph Mehedy, or his predecessor, Al-mansur. He taught the doctrine of metempsychosis, and claimed to be an incarnation of divinity. He had lost one of his eyes, on account of which he always wore a veil, whence he received the epithet of Mokanna. He is the hero of Moore's "Veiled Prophet of Khorassan" in 'Lalla Rookh'.

Athabasca, *āth'a-bās'ka*, the name of a river, pass, lake, and district in northwestern Canada, between the Rocky Mountains and Hudson Bay. The river has its sources in the eastern slopes of the Rocky Mountains, pursues a tortuous course to the north, till it falls into Lake Athabasca; length about 600 miles. Athabasca Pass is in the Canadian Rocky Mountains between Mounts Brown and Hooker. Lake Athabasca, or Lake of the Hills, is about 200 miles in length from east to west, and about 35 miles wide at the broadest part. Its waters are carried off by the Great Slave River, with which it communicates by several small streams issuing from its western end. The north shore is high and rocky, and thickly wooded with firs and poplars, etc.; the south shore is level. The district of Athabasca, formed in 1882, and enlarged in 1895, lies immediately east of British Columbia, and north of Alberta district; area about 251,300 square miles. It is watered by the Athabasca and the Peace River, and contains the Lesser Slave Lake, and other smaller sheets.

ATHALIAH — ATHANASIUS

Ath'ali'ah, the daughter of Ahab, king of Israel, and wife of Joram, king of Judah. She was a woman of abandoned character, and fond of power, who, after the death of her son Ahaziah, opened her way to the throne by the murder of 42 princes of the royal blood. She reigned six years; in the seventh the high priest Jehoiada placed Joash, the young son of Ahaziah, on the throne of his father. Athaliah, attracted by the noise of the people who were crowding to the coronation of Joash, entered with them into the temple, where the ceremony was going on. At the sight of the new king, surrounded by priests, Levites, great officers of the kingdom, and the joyful people, she was beside herself; she tore her hair, and cried out, "Treason!" Jehoiada ordered her to be immediately led from the temple by the officers, and commanded that all who should offer to defend her should be slain; but she was put to death at the gate of the palace without opposition. The altars of Baal, which she had erected, were thrown down, and the worship of God restored (about 877 B.C.) (2 Kings viii. ix.). This story is the theme of Racine's 'Athalie,' written at the request of Madame de Maintenon.

Athalie, a'ta-le, a famous tragedy by Racine, based on the Bible story of Athaliah. It was first performed in 1600. Rachel won her greatest triumphs in this play.

Ath'amas, the son of Æolus, and husband of Nephelê, the cloud goddess. Their children were Hellê and Phryxus. Being afterward separated from Nephelê, he had by Ino, his second wife, Learchus, Melicertes, and Eurycleia. Athamas, having lost his reason through the anger of Hera, and taking Ino and her children for a lioness and her whelps, seized Learchus and dashed him against a stone; while Ino, with Melicertes in her arms, plunged into the sea, and became the sea goddess Leucothea, Melicertes being transformed into Palænon, a divinity worshipped by sailors. Athamas now abandoned Boeotia and fled to Phthiotis, where he built Alos, and united himself with Themisto.

Athan'agild, the 14th king of the Spanish Visigoths, who succeeded Agila in 554, and died in 566. Being threatened by Agila, he applied for aid to Justinian, emperor of the East, who sent troops, and Athanagild defeated his adversary, who was obliged to retire to Merida. Athanagild was re-established at Toledo, which he made his capital.

Athan'aric, a king of the Visigoths in Thrace about the middle of the 4th century: d. Constantinople, 25 Jan. 381. The emperor Valens made war upon him and compelled him to sue for peace, but Athanaric would not come upon the Roman territory to sign the treaty, while Valens thought it beneath his dignity to visit the barbarian at home. Accordingly a bridge of boats was constructed across the Danube, and the two potentates met in the middle. In 380 he was compelled to flee to Constantinople, where Theodosius received him hospitably, and gave him a small pension until his death. See Hodgkin, 'Italy and Her Invaders,' Vol. I. (1880).

Athanasian (ăth'a-nă'zhăn) **Creed**. See CREED.

Athanasius (ăth'a-nă'zhî-ŭs) **Saint**, Bishop of Alexandria, a celebrated Greek theologian: b. Alexandria about 296; d. 373. He had a Christian education, and came into the family of Alexander, afterward archbishop of Alexandria. Alexander took him to the council at Nice, where he gained the highest esteem of the fathers by the talents he displayed in the Arian controversy. About 326 he became bishop of Alexandria. The complaints and accusations of his enemies at length induced the emperor Constantine to summon him in 334 before the councils of Tyre and Jerusalem, but his judges could do nothing, however, further than suspend him from his office. He still continued in the discharge of his duties until the emperor, deceived by new falsehoods, banished him to Treves. The death of Constantine put an end to this banishment at the end of a year and some months. Constantius, emperor of the East, recalled the holy patriarch. His return to Alexandria resembled a triumph. The Arians made new complaints against him, and he was condemned by 90 Arian bishops assembled at Antioch, while 100 orthodox bishops, assembled at Alexandria, declared him innocent. Pope Julius confirmed this sentence, in conjunction with more than 300 bishops assembled at Sardis from the east and west, and in consequence of this he returned a second time to his diocese. But when Constans, emperor of the West, died, and Constantius became master of the whole empire, the Arians ventured to rise up against Athanasius. Athanasius, displaced for a third time, fled into the deserts of Egypt. His enemies pursued him even here, and set a price on his head. To relieve the hermits who dwelt in these solitary places, and who would not betray his retreat, from suffering on his account, he went into those parts of the desert which were entirely uninhabited. He was followed by a faithful servant, who, at the risk of his life, supplied him with the means of subsistence. In this undisturbed spot Athanasius composed many writings, full of eloquence, to strengthen the faith of the believers, or expose the falsehood of his enemies. When Julian the Apostate ascended the throne he allowed the orthodox bishops to return to their churches. Athanasius therefore returned after an absence of six years. The mildness which he exercised toward his enemies was imitated in Gaul, Spain, Italy, and Greece, and restored peace to the Church. But this peace was interrupted by the complaints of the heathen, whose temples the zeal of Athanasius kept always empty. They excited the emperor against him, and he was obliged to flee to Thebais to save his life. The death of the emperor and the accession of Jovian again brought him back; but Valens becoming emperor eight months after, and the Arians recovering the superiority, he was once more compelled to flee. He concealed himself four months, until Valens, moved by the pressing entreaties and threats of the Alexandrians, allowed him to return. From this period he remained undisturbed in his office until he died, 373. Of the 46 years of his official life he spent 20 in banishment, and the greater part of the remainder in defending the Nicene Creed. Athanasius is one of the greatest men of whom the Church can boast. His deep mind, his noble heart, his invincible courage, his living faith,

ATHAPASCAN STOCK—ATHENAGORAS

his unbounded benevolence, sincere humility, lofty eloquence, and strictly virtuous life, gained the honor and love of all. His voluminous writings, which are chiefly controversial and dogmatical, treat of the mysterious doctrines of the Trinity, the incarnation of Christ, and the divinity of the Holy Spirit. His 'Apology Against the Arians,' addressed to the emperor Constantine, is a masterpiece. The creed which goes under his name was not written by him, but belongs to a later time. (See CREED.) The most complete edition of his works is that published at Padua in 1777 (4 vols. folio).

Bibliography.—Bright, 'Lessons from the Lives of Three Great Fathers' (1890); Farrar, 'Lives of the Fathers' (1889); Fisher, 'History of Christian Doctrine' (1896); Harnack, 'History of Dogma,' Vol. IV. (1898).

Athapascan Stock (also *Tinnch*), of American Indians, and one of their most numerous and widely distributed linguistic and ethnological groups. The type-name is taken from a northwest Canadian group, the western Montagnais; but the tribes are scattered from Alaska to Mexico. The original stock were semi-arctic, along the Yukon and Mackenzie, fierce and energetic, but of a low type of culture; and spread southward by conquest on both sides of the Rocky Mountains. They are divided into three chief groups, the northern, the Pacific, and the southern. The first are those in the original home,—northwest Canada and interior Alaska,—Montagnais, Montagnards, Chipewyan, Kutchin, etc. These number about 8,500. The second are those of Washington, Oregon, and California, except the Thlinket coast tribes, which extend along the Alaskan coast also. These are few and scattered tribes, about 900 souls in all. The southern, and far the most important, comprises some 23,500, mostly of the great Apache and Navajo confederacies, also the Jicarillas and Mescaleros, and the Lipan, of Mexico.

Atharvana, at'har'vāṇa, the fourth of the Indian Vedas. Its language is more modern than that of the other three. The theological treatises, regarded as 52 in number, called Upanishads, are appended to the Atharvan Veda.

Atheism, the denial of the existence of a God. Among the Greeks atheism consisted in a denial or non-recognition of the gods of the State. Socrates was put to death for asserting the superiority of the divine wisdom to the other gods, as the ruler and disposer of the universe, thus contradicting Greek mythology, which assigned that office to Zeus. In Latin times atheism still continued to be a negation, with no pretension to rank as a system. It was closely akin to that cultured unbelief which extensively prevailed among the Humanists during the early part of the Renaissance. The atheism of the 18th century was a protest against current religious hypocrisy; and, like its predecessors, put forward little or nothing to replace the system it attempted to destroy. The atheism of the 19th century may be taken to include every philosophic system which rejects the notion of a personal Creator; in this sense it ranks as a genus, of which Atomism, Pantheism, Positivism, etc., are species. Strictly, it is the doctrine that sees in matter the sole principle of the universe. Popularly, athe-

ism consists in the denial of a God; this view is probably founded on the mistranslation of Psalms xiv. 1, and lvi. 1, which should be, "The fool hath said in his heart, No God for me," that is, he wilfully rejects God, at the same time knowing that he is.

Ath'el, or **Æthel**, an Old English word signifying noble, eminent, not only in blood or by descent, but in mind. It is frequently a part of Anglo-Saxon proper names.

Ath'eling, a title of honor among the Anglo-Saxons, meaning one who is of noble blood. The title was gradually confined to princes of the blood royal, and in the 9th and 10th centuries applied exclusively to the sons or brothers of the reigning king. It was first conferred on Edgar by Edward the Confessor, his grand-uncle, who bestowed it when he designed to make him successor to himself on the throne.

Athelney, äth'el-nī, a marshy island in Somersetshire, England, about seven miles southeast of Bridgewater. It is formed by the junction of the rivers Parret and Tone. Alfred the Great established a fortified post here during a Danish invasion, and afterward founded an abbey which has entirely vanished.

Ath'elstan, a Saxon monarch, the first to assume the title of king of England. He succeeded his father, Edward the Elder, in 925, and died in Gloucester, 27 Oct. 940. He was victorious in his wars with the Danes of Northumberland, and the Scots, by whom they were assisted. After a signal overthrow of his enemies at Brunanburh (937) he governed in peace and with great ability. In his reign a law was passed conferring the rank of thane on every merchant who had made three sea voyages on his own account. He died in 940.

Ath'e'na. See MINERVA.

Ath'enæ'um, the general name of temples to Athena, but more especially applied to the temple at Athens, frequented by poets, learned men, and orators. Instruction was also given there to the youth, and in later times the name was applied to all places of education for the young. The same name was given at Rome to the celebrated school which Hadrian established on the Capitoline Mount about 135 A.D. Many learned men received ample salaries for giving instruction in this institution, and that they might be enabled to study at leisure. Here also learned men assembled to exchange ideas.

Ath'enæus, a Greek rhetorician and grammarian, who lived at Naucratis, in Egypt, then at Alexandria, and afterward at Rome, at the end of the 2d and beginning of the 3d century after Christ. He has left an encyclopedic work in the form of conversation, called the 'Feast of the Learned' (Deipnosophistæ), a rich but ill-arranged treasury of historical, antiquarian, philosophical, grammatical, and other knowledge. The principal editions are those of Schweighäuser (1801-7); Dindorf (1827); Meineke (1859-67).

Ath'enag'oras, a Christian philosopher of Athens, who wrote in Greek an 'Apology for the Christians,' addressed to the emperor Marcus Aurelius, in 177. This work defends the Christians from the accusations brought against them by the heathens (of atheism, of incest, of

ATHENAIΣ — ATHENS

eating murdered children, and the like), with a philosophical spirit and in a lively and forcible style.

Ath'ena'is, or **Eudocia**, empress of the East, daughter of the Athenian philosopher Leontius: b. Athens about 393-4 A.D.; d. Jerusalem about 465. Athenais gaining the favor of Pulcheria, sister of the emperor Theodosius, a youth of 20 years of age, presently became the wife of Theodosius and was persuaded to receive baptism by the name of Eudocia. By Theodosius she had a daughter, Eudoxia, who was married to Valentinian III., emperor of the West. She was indisposed to submit to the authority of Pulcheria, who virtually ruled the empire of the East, and a quarrel ensued, in which Eudocia had for a time the ascendancy; but the jealousy of her husband being aroused, the authority of Pulcheria was restored, and Eudocia was permitted to retire to Jerusalem. When her daughter and granddaughters were taken prisoners by Genseric she became reconciled to the orthodox Church.

Athene, a-thé'ne. See MINERVA.

Athe'ne, Temple of. See ÆGINA.

Athen'odo'rus, a Greek sculptor of the Rhodian school, who, with his father, Agesander, and Polydorus, executed the celebrated group of the "Laocoon."

Ath'ens, Ala., county-seat of Limestone County, situated on the Louisville & N. railroad, 107 miles south of Nashville, Tenn., 85 miles north of Birmingham. Athens has a cotton factory, knitting mill, sash, door and blind factory, two large lumber mills, State Agricultural School; Athens Female College, under ownership and direction of North Alabama Conference, Methodist Episcopal Church south. Has five churches for whites and several churches for colored population, and two newspapers. Surrounded by a splendid agricultural country and has many advantages. City owns and operates water and light plant and the town has an excellent sewer system. City also owns and operates a dispensary.

ROBERT M. RAWLS,
Editor 'Alabama Courier.'

Ath'ens, Ga., a city and county-seat of Clarke County, on the Oconee River, and the Central of G., the Georgia, the Northeastern of G., and the Seaboard A. L. R. R.'s, 67 miles east of Atlanta, the State capital. It is in a cotton-growing region; has a large trade in that staple; and contains cotton and woolen, cotton-seed oil, bobbin, and hosiery mills, iron works, furniture factories, and other industrial plants. It is the seat of the University of Georgia, the State College of Agriculture and Mechanic Arts, Lucy Cobb Institute, Knox Institute, Jeruel Academy, and a State Normal School. There are electric light and street railway plants, two national banks, several hotels, and daily, weekly, and monthly periodicals. The assessed property valuation exceeds \$6,000,000. Athens was first settled in 1801. Pop. (1904) 14,000.

Ath'ens (ancient Greek, *Athēnai*), the capital of the kingdom of Greece, anciently the capital of the State of Attica and the centre of Greek culture. Its origin and early history are

shrouded in darkness. It is situated in the central plain of Attica, about four miles from the Saronic Gulf or Gulf of Athens, an arm of the Ægean Sea, running in between the mainland of Greece and the Peloponnesus. The site is irregular, the city having been built on and around several hills rising from the plain, Mount Lycabettus, on the northeast, overlooking the whole. The principal eminence within the city boundary was the Acropolis, the site first built on; west from the Acropolis was a lower hill, called the Areopagus; southwest from the Areopagus was the Pnyx and south from the Pnyx the Museum; toward the sea on the south the view was unimpeded. On the east of the city was the stream known as the Ilissus, and on the west the Cephissus. The Acropolis was often called Polis or the city, from its having formed the original nucleus of the town, while the whole city, or sometimes only the lower city, as distinct from the Acropolis, was called Astu. In the Areopagus and the line of hills that run north and south to the west of it traces of numerous dwellings cut in the rocks have recently been found. At its most flourishing period, in the 5th century B.C., Athens was connected with its port-town Piræus and the harbors of Piræus and Munychia by two massive walls 550 feet apart, while a third wall ran to the less important harbor of Phalerum. The first was considered the most convenient, and was one of the emporiums of Grecian commerce. The surrounding coast was covered with magnificent buildings, whose splendor vied with those of the city. The walls of rough stone which connected the harbors with the city were so broad that carriages could go on their top. The Acropolis contained the most splendid works of art of which Athens could boast. Its chief ornament was the Parthenon or Temple of Athena Parthenos (the Virgin). This magnificent building was 228 feet long, 101 broad, and 66 high. It was built under the administration of Pericles, and finished in 438 B.C. It was of the Doric order of architecture, and was built of marble, resting upon a basement of limestone. It had columns on all sides, 8 at either front and 17 at the sides, counting the corner columns twice. These columns were fully six feet in diameter at the base, and 34 feet high. The structure was adorned both within and without with statues, reliefs, and other sculptures. Inside the temple stood the statue of Athena by Phidias, a masterpiece of art, nearly 40 feet high, the unclothed portions formed of ivory, the drapery of plates of gold, the weight of which was estimated at 44 talents. The Propylæa, a magnificent building, built of white marble, formed the entrance to the Acropolis, of which it covered the whole western end. A splendid marble stair, 70 feet broad, led up to the Propylæa. The chief building on the Acropolis, in addition to the Parthenon and the Propylæa, was the Erechtheum, a kind of double temple, especially sacred to Athena Polias (or Athena, guardian of the city), and Erechtheus, or Poseidon. On the Acropolis also were other temples, altars, statues, etc., including a colossal bronze statue of Athena Promachos, 50 or 60 feet high. On the south slope of the Acropolis were the theatre of Dionysus, the Odeum of Pericles, and the later Odeum of Herodes, the latter two buildings being intended for musical competitions. In

ATHENS

the lower city the greatest pieces of architecture were the temples of Theseus and Olympian Zeus, one of which stood on the northwest, the other on the southeast side of the Acropolis. The first was of Doric architecture, and resembled the Parthenon. On the metopes of this temple the famous deeds of Hercules and Theseus were excellently represented. The temple of Zeus Olympius was of Corinthian architecture, and was the largest temple in Athens, and the greatest ever erected to the supreme deity of the Greeks. It was begun by Pisistratus, and continued from time to time until at length, after 700 years, it was finished by Hadrian. The outside of this temple was adorned by 120 fluted columns, 60 feet high, and 6 feet in diameter. It was 354 feet long and 171 broad. Other structures deserving of notice were the Horologium of Andronicus Cyrrhestes or the "Temple of the Winds," the choragic monument of Lysicrates, and the Stoa Poikilē or gallery of paintings. Besides these wonderful works of art Athens contained many other places which must always be interesting from the recollections connected with them. Such a spot was the renowned Academy where Plato taught, lying about six stadia north of the city, and consisting of a gymnasium surrounded by walks, groves, and fountains. Such a place was the Lyceum, where Aristotle taught, and which, through him, became the seat of the Peripatetic School. It lay on the bank of the Ilissus, opposite the city, and was also used for gymnastic exercises. Not far from thence was the less renowned Cynosarges, where Antisthenes, the founder of the Cynic School, taught. The sects of Zeno and Epicurus held their meetings in the city. Zeno chose the well-known Poikilē, and Epicurus established himself in a garden within the walls, for he loved both society and rural quiet. Not only literary, but political assemblies gave a particular interest to different places in Athens. Here was the court of Areopagus, where that illustrious body gave their decisions; the Prytaneum or senate-house; the Pnyx, where the free people of Athens deliberated. After 23 centuries of war and devastation, of changes from civilized to savage masters, have passed over this great city, its ruins still excite astonishment. The northern wing of the Propylæa is still tolerably perfect, and the inner wall, with its five gateways leading into the Acropolis, still stands. The Parthenon remained almost entire till 1687, when it was much injured by an explosion of gunpowder during the siege of Athens by the Venetians. It is now a magnificent ruin. Its two pediments represented, respectively, the contest of Poseidon and Athena for Athens and the birth of the goddess, while the metopes represented a number of events in which the goddess or heroes connected with Athens took part. A great number of these sculptures are now in the British Museum. In the whole of this mutilated building we find an indescribable expression of grandeur and sublimity. Near the Propylæa is the small but elegant temple of Nikē Apteros (Wingless Victory), which having been destroyed in 1687, was re-erected in 1835 from its remains. There are also astonishing remains to be seen of the Erechtheum, especially the beautiful female figures called Caryatides, supporting the roof of the southern portico. The

Temple of the Winds is still tolerably perfect. Its form is an octagon: on each side it is covered with reliefs, which represent one of the principal winds. The choragic monument of Lysicrates also remains. It consists of a pedestal surrounded by a colonnade, and is surmounted by a dome of Corinthian architecture. Outside of the city are the lofty ruins of the temple of the Olympian Zeus. Of 120 pillars 16 remain, but none of the statues are in existence. The pedestals and inscriptions are scattered here and there, and partly buried in the earth. The main body of the temple of Theseus has remained almost entire, and it now contains a collection of ancient sculpture. On the hill where the famous court of Areopagus held its sittings are to be seen steps hewn in the rock, places for the judges to sit, and over against these the stations of the accuser and the accused. The hill became a Turkish burial-ground, and is covered with monuments. The Pnyx, the place of assembly for the people, not far from the Areopagus, is very nearly in its primitive state. One may see the place from which the orators spoke hewn in the rock, the seats of the scribes, and at both ends the places of those officers whose duty it was to preserve silence, and to make known the events of public deliberations. The niches are still to be seen where those who had any favor to ask of the people deposited their petitions. The spot occupied by the Lyceum is only known by a quantity of fallen stones. The ground occupied by the gardens of the Academy is still well cultivated and fertile. The long walls are totally destroyed, though the foundations are yet to be found on the plain. The Piræus has scarcely anything of its ancient splendor, except a few ruined pillars scattered here and there, though it promises to become a handsome modern town, and has again a harbor filled with shipping, engaged in carrying on a considerable trade. The most thorough investigation of the places among the ruins of Athens worthy of attention is contained in Leake's 'Topography of Athens, with Some Remarks on its Antiquities' (1821, with an atlas in folio; 2d ed. 1841). Other valuable works on the same subject are such as Stuart and Revett's 'Antiquities of Athens' (1762-1816); Dodwell's 'Tour Through Greece'; Wordsworth's 'Athens and Attica'; Curtius' 'Attische Studien'; Dyer's 'Ancient Athens'; and Wachsmuth's 'Die Stadt Athen in Alterthum.' Ancient Athens is believed to have had a population of not more than 200,000.

Athens was at no time so splendid as under the Antonines, when the magnificent works of from eight to ten centuries stood in view, and the edifices of Pericles were in equal preservation with the new buildings. Plutarch himself wonders how the ancient structures could retain such a perpetual freshness. Pausanias, who traveled in Greece at this time, that is, in the 2d century after Christ, has left a valuable account of the state of Athens as he saw it. Many of the edifices of later times were due to foreign potentates, rulers of Pergamus, of Egypt, of Rome. But after a time the wholesale robberies of collectors, the removal of great quantities of the works of art, first to Rome and then to Constantinople, Christian zeal, and the attacks of barbarians, made sad

ATHENS — ATHERTON

inroads among the monuments. When Justinian closed the schools of the philosophers in 529, Athens soon ceased to be a centre of intellectual activity. The Parthenon was turned into a church of the Virgin Mary, and Saint George stepped into the place of Theseus. In 1456 Athens fell into the hands of the Turks, under whom the Parthenon became a mosque. When it was selected as the capital of the modern kingdom in 1833, it had only a scanty population inhabiting a scene of ruins.

Modern Athens lies mostly northward and eastward from the Acropolis, and consists of well-built streets, the most important being Piræus, Athens, Stadion, and University. Among the principal buildings are the royal palace, the university, the academy of science and art, the polytechnic, the national museum, the observatory, the chamber of deputies, exhibition buildings, new theatre, and new library. The palace (1838-43) is a conspicuous but unattractive building of limestone with marble portico. The National University, founded in 1837, is a handsome structure, with a large number of teachers and an attendance of over 2,000 students. The academy is a beautiful building faced with Pentelic marble; the new National Library is also a fine building, containing over 200,000 volumes, and so is the Polytechnic School, part of which is occupied as a museum, and contains the Schliemann and other collections. Saint Nicodemus, the largest and finest of the Byzantine churches (62 feet long by 45 wide), dates from the 11th century. Athens is well equipped with educational institutions, possessing besides the National University and Polytechnic School, a number of high schools, a gymnasium, a school for the higher education of girls and female teachers, orphanages for boys and girls, and four foreign archaeological schools or institutes, the French, German, American, and British. The city is governed by a mayor elected every four years, with a council of 18 members. There is a municipal fire department and the city controls the gas, electric light and waterworks, but the water supply is so inefficient that the inhabitants are obliged to have recourse to water-carriers. Street cars cross the city in all directions and it is an important railroad centre. The bathing resort of Phaleron, adjoining the Fort of Piræus, is connected with Athens by a suburban railroad. The city has very little manufacturing, although the financial centre of the kingdom, and its trade is concerned chiefly with its own requirements. Pop. (1896) 111,486.

Athens, Ohio, a town and county-seat of Athens County, situated on the Baltimore & O. S. W., the Toledo & O. C., the Hocking V. & T., and the Kanawha & M. R.R.'s. Athens was settled in 1797, and in 1811 was incorporated. The government is by a mayor, elected every two years, and a village council. The town owns and operates the waterworks. It is the seat of Ohio State University (q.v.) and of the Southeastern Ohio Insane Asylum, and manufactures lumber and brick. Pop. (1900) 3,066.

Athens, Tenn., a town and county-seat of McMinn County, on the Southern R.R. half way between Knoxville and Chattanooga, 56 miles to either city. The town was incorpor-

ated in 1868. It has woolen mills, spinning mills, lumber factories and two newspapers. It is the seat of Grant Memorial University (q.v.). Pop. (1904) 2,600.

W. T. LANE,
Editor 'Athens Post.'

Athens, Texas, city and county-seat of Henderson County; at the junction of the Saint Louis & S. and the Texas & N. O. R.R.'s., 75 miles from Dallas. It is an important manufacturing town and has pressed brick, fire brick and tile works, cotton oil mills, potteries, and other industries. There are excellent public schools, four churches, and two national banks. Athens was first settled in 1850 and was incorporated as a city in 1901. Pop. (1900) 3,200.

Athens of America, a name frequently applied to Boston, Mass., on account of her intellectual and literary pre-eminence.

Athens of the North, a name given to Edinburgh, Scotland, on account of the picturesque of the site and beauty of architecture, as well as intellectual distinction. Copenhagen also is often so called.

Athens of the West, a name given to Cordova, Spain, the centre of Arab learning and culture in the Middle Ages.

Athens, American School at, an institution for classical study, founded in Athens, Greece, in 1882. It is a branch of the Archaeological Institute of America, and is managed by a committee representing various colleges in the United States which contribute to its support. The building was erected by means of private subscriptions, on grounds donated by the Greek government, and the institution has an endowment of \$50,000.

Atherine, a small fish, from five to six inches long, called also the sandmelt.

Atheroma, a term sometimes applied to the process of arteriosclerosis as a whole, but best restricted to that type of chronic degeneration of the blood vessels associated with softening of the tissues and their infiltration with the necrotic products, fat cholesterol, etc. See ARTERIES, DISEASES OF.

Atherton, Charles Gordon, American politician: b. Amherst, N. H., 1804; d. Manchester, N. H., 15 Nov. 1853. He was graduated from Harvard in 1822, was a member of the New Hampshire legislature for five years and speaker of the lower house for four, and in 1837-43 was a Democratic representative from New Hampshire in Congress. In 1843-9 and 1852-3 he was a member of the Senate. On 11 Dec. 1838 he introduced in the house the so-called "Atherton gag" resolution, which provided that all bills or petitions on the subject of slavery should be "laid on the table without being debated, printed, or referred." The resolution was passed by a vote of 126 to 73, and remained in effect until 1844. It was resolutely opposed by J. Q. Adams, who advocated the "right of petition." Adams was ultimately victorious, and on 3 Dec. 1844 the 21st rule of the House, providing that no paper praying the abolition of slavery or the slave trade should be in any wise entertained, was abolished by a vote of 108 to 80. See GAG-RULES.

Atherton, George William, American educator: b. Boxford, Mass., 20 June 1837. He worked his way through Phillips Exeter Acad-

ATHERTON—ATHLETICS

emy and Yale College; was professor of political economy and constitutional law in Rutgers College, N. J., in 1869-82; was admitted to the bar of New Jersey in 1878; and became president of the Pennsylvania State College in 1882.

Ath'erton, Gertrude Franklin (HORN), American novelist: b. San Francisco in 1857. Since the death of her husband she has chiefly pursued a literary career, and has resided in London since 1894. She has written 'The Doomswoman' (1892); 'Before the Gringo Came' (1894); 'A Whirl Asunder' (1895); 'Patience Sparhawk and Her Times' (1897); 'American Wives and English Husbands' (1898); 'The Californians' (1898); 'A Daughter of the Vine' (1899); 'The Valiant Runaways' (1899); 'Senator Worth' (1900); 'The Aristocrats' (1901); 'The Conqueror' (1902); 'The Splendid Idle Forties' (1902), a revision of 'Before the Gringo Came.'

Ath'erton, a manufacturing town of England, Lancashire, 13 miles northwest of Manchester, containing cotton-factories, collieries, iron-works. Pop. (1900) 16,200.

Ath'erton Res'olu'tions. See GAG RULES.

Athetosis, a peculiar movement, usually of the hands and fingers, occurring after some destructive process in the brain. It is seen in the young who have suffered severe injuries at birth and sometimes following an apoplectic stroke.

Ath'letes (Greek, *athlētai*), combatants who took part in the public games of Greece; also young men who went through the gymnastic exercises to harden themselves and to become fit to bear arms. In a narrower sense athletes were those who made the athletic or gymnastic exercises their principal business, particularly wrestlers and boxers. Their business was to contend at the public festivals, and they regulated their habits of life for this end. Not only the applause of the people, but also crowns and statues, were conferred upon the victor. He was led in triumph; his name was written in the public records; and poets sang his praise. He also received peculiar privileges, had a yearly pension, and the foremost seat at the sacred games.

Athlet'ics, or **Athletism**, is the exhibition of man's physical prowess in games of skill and endurance, and though in the passing centuries it has undergone many phases, it is practically the same to-day as when the Olympian games, which were resumed at the Pan-American Exhibition at Buffalo in 1901, were originally given 2,500 years ago, and Greece met in her prime. Then not only Greek met Greek, but the influence of the Olympian, Pythean, Nemean and Isthmian games was felt to the farthest extremities of Asia. After the fall of Rome, the mantle of physical prowess which that nation had inherited from the Greeks, fell upon the shoulders of the sturdy Norseman, whose chief glory was in his individual capacity to bear unflinchingly the stress and strain of contests and the elements. They bred into the bone, the hardihood, and love of personal achievement which in turn carried the current through the Dark Ages, even into those of the exaggerated chivalry, which Cervantes killed with ridicule

in 'Don Quixote.' The spirit of the Greek, Roman, and Norseman planted its seeds in the hardy Anglo-Saxons, who in turn transplanted them into Virginian and New England soils on the northern continent of America, where its influence has been felt, even to the entire disappearance of the softer Latin races' supremacy. It is not surprising, therefore, that, with the disappearance of the earlier modes of life of the first settlers, calling for all the physical strain that the human frame was capable of, and the return of the comparative leisure which in early youth now surrounds the American universities and colleges, there has re-appeared a yearning after opportunities to supply, artificially, if so it must be, the stress and contest, physical effort, and the proof of supremacy of the earlier ages, when such conditions were compulsory. It was in the blood, and it came out, much to the nation's benefit. First in the form of isolated college and club contests, and subsequently in such a volume as to need a separation of contests into classes and the creation of an especial federation of the separate units, to regulate and control it. In the beginning, athletics developed in this or that college, or university, or club, acting separately and indiscriminately in its scope. Ultimately the lines of natural cleavage forced athletics into its two great branches: one outdoors, commonly known as track-events; the other, those carried on in a gymnasium. The out-door events are those which are now usually meant when the term athletics is used. The development of these came tentatively. First one college, or university, or club, then another, organized outdoor contests, until at length the net was spread over all the rising generation, and the Amateur Athletic Union was formed, whose fundamental rule is that "no person shall be eligible to compete in any athletic meeting, game or entertainment given or sanctioned by this Union who has (1) received or competed for compensation or reward, in any form, for the display, exercise or example of his skill in or knowledge of any athletic exercise, or for rendering personal service of any kind to any athletic organization, or for becoming or continuing a member of any athletic organization; or (2) has entered any competition under a name other than his own, or from a club of which he was not at that time a member in good standing; or (3) has knowingly entered any competition open to any professional or professionals, or has knowingly competed with any professional for any prize or token; or (4) has issued or allowed to be issued in his behalf any challenge to compete against any professional, or for money; or (5) has pawned, bartered or sold any prize won in athletic competition; or (6) is not a registered athlete. Nor shall any person residing within the territory of any active member of this Union be eligible to compete for or to enter any competition as a member of any club in the territory of any other active member of this Union, unless he shall have been elected to membership in such club prior to 1 April 1891; provided, however, that this restriction as to residence shall not apply to undergraduates connected with any allied college athletic organization.

"No one shall be eligible to compete in any athletic meeting, games or entertainment given or sanctioned by this Union, unless he shall be

ATHLONE; ATHOL

a duly registered athlete, a member of the organization from which he enters, and shall not have competed from any club in this Union during a period of three months next preceding such entry; nor shall any member of any club in this Union, or any club in any district in this Union be allowed to compete in case he has withdrawn in one year competed as a member of any other club then in this Union, except with the consent of such other club, which consent shall be filed with the registration committee of his district prior to such competition unless such other club shall have disbanded or practically ceased to exist; provided that the requirements of this section shall not apply to any athletic meeting, games, or entertainment, the entries for which are confined to the club or organization giving such meeting or entertainment.

"No athlete who has been released from a club which is a member of this Union, and who competes for another club directly thereafter, shall be allowed to compete again for the club he was released from for one year from the date of his release, except that the club has disbanded or ceased to exist.

"No person shall be eligible to compete for or enter any competition as a member of any club in the territory of any active member of this Union, unless he shall have resided within the territory of said active member at least four months previous to entering for competition; nor shall any person be eligible to enter or compete in any district championship meeting unless he shall have been a bona-fide resident of such district for at least six months prior to the holding of such championship meeting; and no person shall be eligible to compete in a championship meeting of more than one district in one year. The restrictions contained in this section shall not affect the eligibility of an undergraduate connected with any allied college athletic organization who shall have been elected to membership in any club of this Union prior to 20 Nov. 1899, to represent such club as long as he remains an undergraduate; nor shall these restrictions apply to an undergraduate competing for any college belonging to an allied body."

The Amateur Athletic Union (A.A.U.) of the United States has jurisdiction over the following out-door sports among amateurs: Baseball, bicycling, boating, bowling, cross-country running, football, hurdle-racing, jumping, lacrosse, lawn-tennis, pole-vaulting, putting the weight, quoits, racquets, running, skating, sculling, swimming, throwing the hammer, throwing weights, tug of war, and walking. The Union consists of the *Metropolitan Assoc.*, comprising the States of New York and New Jersey, north of Trenton; the *New England Assoc.*, comprising Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; the *Atlantic Assoc.*, comprising New Jersey, south of and including Trenton, Delaware, Maryland, Pennsylvania, West Virginia, District of Columbia, Virginia, North Carolina, South Carolina, Florida, and Georgia; the *Central Assoc.*, comprising Ohio, Illinois, Indiana, Michigan, Wisconsin, Iowa, Minnesota; the *Pacific Assoc.*, comprising California, Arizona, Nevada, Utah, Idaho, Oregon, and Washington; the *Southern Assoc.*, comprising Alabama, Louisiana, Florida, Mississippi, Texas, Georgia, and Tennessee; the

Western Assoc., comprising Missouri, Wyoming, Arkansas, Oklahoma, South Dakota, North Dakota, Indian Territory, Kansas, Kentucky, New Mexico, and Colorado; and the *Pacific Northwest Assoc.*, comprising Idaho, Montana, Oregon, Washington, and Alaska. All its meetings are under the direction of "a games committee," one referee, two or more inspectors, three judges at finish, three or more timekeepers, a starter, a clerk of the course, a scorer, and a marshal; besides which all the conditions and restrictions for various events: the number of throws allowed, the size of the area of preliminary effort, as in shot-putting, etc., are subject to definitions from time to time promulgated, and imposed, by virtue of the authority of the A. A. U. in meeting assembled.

The athletic events at outdoor field meetings are for 100, 220, 440, and 880 yards run; 1 and 5 mile run; 1 and 3 mile walk; 2 mile bicycle ride; pole vault for height; running high and broad jumps; throwing 16-pound hammer; throwing 56-pound weight, for distance; putting 16-pound shot; 120 yards hurdle-race, 10 flights 3 feet 6 inches high; 220 yards hurdle-race, 10 flights 2 feet 6 inches high; and at indoor meetings, for runs of 75, 150, 300, 600, and 1,000 yards; 2 mile run; three quarter mile and 4 mile walk; standing, broad, and high jumps; three standing broad jumps; running hop, step, and jump; pole vault for distance; throwing 56-pound weight for height; putting 24-pound shot; 200 yards hurdle-race, 10 flights 3 feet 6 inches high; 300 yards hurdle-race, 10 flights 2 feet 6 inches high; and tug of war, 4 men, unlimited weight. The associations award in each year three prizes for all-round excellence to the three athletes making the highest three aggregate scores, and two prizes for individual excellence. The Intercollegiate Association of Amateur Athletes of America is the governing body of inter-college athletics. Its championships must be won at the annual meeting. See also GYMNASICS.

Athlone, áth-lôn', a town of Ireland, on the Shannon, about 67 miles west by north of Dublin. It is divided by the river into two nearly equal parts, which communicate by a handsome stone bridge of five arches. It is one of the chief depôts for troops and military stores; and the barracks, occupying a height above the river, can accommodate 1,500 men, and have attached an ordnance yard, magazines, and armory provided with 15,000 stand of arms. By means of a canal the Shannon has been rendered navigable for 71 miles above the town, which, being also terminus of four important railways, carries on a brisk trade. The chief industrial establishment is an extensive woolen factory, and there are also large saw-mills. Pop. (1891) 6,742.

Ath'ol, Mass., a town in Worcester County, on Miller's River, and the Boston & A., and Fitchburg R.R.'s; 26 miles northwest of Worcester. It contains several villages, has electric railways connecting with the suburbs, and is principally engaged in the manufacture of cotton warps, shoes, sewing-silk, fine mechanical tools, matches, organ-cases, pocket-

ATLANTA UNIVERSITY — ATLANTIC OCEAN

The Georgia Institute of Technology, with 481 students, is the most important institution for higher education. It has textile, mechanical engineering, and electrical engineering schools, and machine-shop practice, in addition to literary and scientific courses. The total number of students in these institutions for white youth is 2,500. A site has been given and funds are partially raised for a Presbyterian university, the total investment of which will be \$1,000,000.

There are six institutions for the higher education of colored youth, with a total attendance of 2,265. They include literary and scientific schools, theology, industrial training, and a training school for nurses. Charities are numerous and include such educational features as free kindergartens, night schools, and three orphan asylums. Grady Hospital is supported by the city; St. Joseph's Infirmary by the Roman Catholics, and the Presbyterian Hospital by the Presbyterians. Private hospitals or sanatoriums are numerous and well equipped. There are two theatres with 2,500 and 2,000 seating capacity, and two lyceum or lecture associations. Carnegie Library is a white marble building in classic style, and contains 20,000 volumes. The book circulation is 11,000, one fourth among juveniles. There are 131 churches, including missions, and the attendance in fair weather averages 25 per cent of the population. The total membership exceeds a third of the population. Railway facilities include 10 radiating lines, five of which belong to the Southern Ry., and three controlled by the Louisville & N. system. A union depot to cost \$900,000 is under construction. Belt lines complete the terminal system. Local transportation is unified in a system of well-equipped street railways, covering 142 miles of track, 100 miles within the city, the rest extending eight miles out. The area of the city is 11 square miles, and the boundary a circle of $3\frac{1}{2}$ miles diameter, extended in two suburbs. Street improvements since 1880 cost \$3,807,667, including 100 miles of sewers, 63 of paved streets, 227 of sidewalks. Six miles of streets are paved with asphalt, the remainder with granite blocks, macadam, and vitrified brick. The city waterworks takes its supply from the Chattahoochee River above Peachtree Creek, in a sparsely populated district. By settling and filtration water is purified. Two engines of 15,000,000 gallons daily capacity each pump it into the city. The consumption in 1902 was 8,966,000 gallons a day. For domestic use water is supplied at 10 cents per thousand gallons. At this rate, with some reduction to manufacturers, the city makes a profit. Fire, police, sanitary, and other city departments are well equipped and efficient. The city government is administered by a mayor and general council. Appropriation bills are voted separately by two legislative branches, and the mayor has a veto. Bonded debt is limited by State Constitution to 7 per cent of the taxable wealth. The charter requires a sinking fund to retire all bonds in 30 years from date of issue. Atlanta is one of ten cities designated by the secretary of the treasury whose bonds might be used as security for federal deposits. The tax rate is $1\frac{1}{4}$ per cent and the assessment averages 60 per cent of actual value.

The cool and invigorating climate makes Atlanta a desirable place of residence, the mean summer temperature being 77; winter 44. Streets are made attractive by grassy lawns and shade

trees. Grant Park, Piedmont Park, Lakewood, East Lake, Ponce De Leon Spring, and the Chattahoochee River are outing resorts. A bill has been introduced in Congress to make a national military park on the battle ground north of the city. Public spirit is strong in Atlanta. The Chamber of Commerce, Clearing House Association, Credit Men's Association, Manufacturers' Association, and Freight Bureau are organs for concerted action among business men. The Greater Georgia Association, projected by the Atlanta Chamber of Commerce, unites the efforts of Georgia towns, cities, and counties to develop the resources of the State. Fraternal and social organizations are numerous and active. Religious denominations are well organized.

W. G. COOPER.

Atlan'ta University, a co-educational (non-sectarian) institution, in Atlanta, Ga., organized in 1869. In 1899 it had 20 professors, 300 students, 10,500 volumes in the library, grounds and buildings valued at \$250,000, and an income of \$35,000.

Atlantes, ät'-län'tēz, in architecture, colossal statues of men used instead of pillars to support an entablature. Roman architects called them *telamones* (Greek)

Atlan'tic, Iowa, a city and county-seat of Cass County, situated on the Chicago, R. I. & P. R.R., 80 miles southwest of Des Moines. It has various manufacturing interests, including iron and bridge works, planing mills, canning factories, starch-works, soap-factory, and two machine shops. It was chartered as a city in 1869. Pop. (1900) 5,046

Atlan'tic City, N. J., a city and seaside resort in Atlantic County; on the Atlantic Ocean and on the Reading and the Pennsylvania R.R.'s. It is built on a long, sandy island, known as Absecom Beach, 60 miles southeast of Philadelphia. The island stretches along the coast for 10 miles; has an average width of three fourths of a mile, and is from four to five miles from the mainland. At the north end is the Absecom Light, well known to coastwise sailors. The city has several miles of bathing beach, a magnificent promenade on the ocean front, nearly 100 hotels and boarding houses, electric lights, public schools, churches of the principal denominations, seven national banks, and daily, weekly, and monthly periodicals. It is probably the most important all-the-year-round resort in the United States, its splendid climate giving it a large popular patronage even in the dead of winter. The assessed property valuation exceeds \$14,000,000. A fire in April 1902 destroyed many hotels and other buildings and led to a municipal enactment that all structures henceforth erected within the municipal limits must be fireproof. Atlantic City was first settled in 1854. It is governed by a mayor and a city council of 17 elected by popular vote. Pop. (1890) 13,055; (1900) 33,000; (in summer) 150,000.

Atlan'tic Ocean, the vast expanse of water lying between the western coasts of Europe and Africa, and the eastern coasts of North and South America, and extending from the Arctic to the Antarctic Seas. Its greatest breadth is between the western coast of North Africa and the eastern coast of Florida in North America,

GEORGIA SCHOOL OF TECHNOLOGY.

CARNEGIE LIBRARY.

ATLANTIC OCEAN

a distance of 4,150 miles. If the Gulf of Mexico, in reality one of its bays, be included, it will extend to 5,000 miles. Its least breadth, between Norway and Greenland, is about 930 miles. Between Cape St. Roque, Brazil, and Sierra Leone, the breadth is 1,730 miles. Its superficial extent has been estimated at 25,000,000 square miles. From the number and extent of its inlets, gulfs, and bays, its coast lines are of great length, the eastern being upward of 32,000 miles, and the western upward of 55,000. Its principal inlets and bays are Baffin and Hudson bays, the Gulfs of Mexico, Honduras, and San Juan, the North Sea or German Ocean, the Bay of Biscay, and the Gulf of Guinea. The principal islands north of the equator are Iceland, the Faroe, and British islands, the Azores, Canaries, and Cape de Verd islands, Newfoundland, Cape Breton, and the West India islands; and south of the equator, Ascension, St. Helena, Trinidad, Columbus, and Tristan da Cunha, the last three being mere rocks.

Currents — The great currents of the Atlantic are of two kinds, drift and stream. Drift currents are produced by the wind, either by the perpetual or trade winds, or by prevailing winds. Those having the former origin are constant, running always in the same direction, and generally with a nearly equal velocity; those having the latter are not so constant, neither do they always run in the same direction, nor at a similar rate. The drift currents produced by the trade winds are found between the tropics; those resulting from prevailing winds, north and south of the parallels of 30°. Stream currents are due indirectly to the influence of winds, being produced by drift currents, of which they are continuations. As these currents travel for great distances they meet with many obstacles in their course, which result in changes of direction. A stream current may thus be successively propelled by different currents, or consist in the combination of different stream currents. A third kind of currents is produced by the flow of the water to restore the level disturbed by other currents. This is called a current of indraught. The great currents of the Atlantic are the Gulf Stream, the equatorial current—which may be divided into the main equatorial current, the north equatorial current, and the south equatorial currents—the North African and Guinea current, the South connecting current, the Southern Atlantic current, Cape Horn current, Rennel current, and the Arctic current.

The Gulf Stream is a continuation of the main equatorial current, and partly of the north equatorial current, both western drift currents produced by the trade winds. The former passes across the Atlantic to the American coast, upon which it strikes from Cape St. Roque to the Antilles. On being turned by the coast it runs along it at a rate of 30 to 50 miles per day, and sometimes at a higher speed, till it enters the Gulf of Mexico, from which, having previously received part of the waters of the north equatorial current, it issues between Florida and Cuba under the name of the Gulf Stream. It afterward flows nearly parallel to the coast of the United States, separated from it by a belt of cold water. Off Cape Hatteras it spreads into an expanding channel, reaching a breadth of 167 miles, and consisting of three warm sections with two cold belts interposed.

On passing Sandy Hook it turns east and continues to be recognizable, partly by the blue color derived from the silt of the Mississippi, till about lon. 30° W., where, with a greatly diminished temperature, it is found flowing nearly due east. The equatorial current, so called from its being under the line, commences on the western coast of Africa, about lat. 10° S., or nearly opposite St. Paul de Loando. From this point it pursues a northwest direction till it makes lon. 0°, when it proceeds due west on both sides of the equator, till it arrives at Cape St. Roque in South America, when it is divided into two branches, one running along the Guiana coast, and into the Gulf of Mexico, as already mentioned, the other along the coast of Brazil, and so called the Brazil current. The latter is reinforced by the south equatorial current, which, however, is not distinctly separable from the main equatorial current. The length of the equatorial current, from the coast of Africa to Cape St. Roque, is 2,500 miles. Its breadth near the commencement is 185 miles; opposite Cape Palmas, 420; and before dividing, about lon. 31° or 32° W., it is 510. Its average velocity, which is greater in summer than in winter, is from 25 to 30 miles a day. The North African and Guinea current originates between the Azores and Cape Finisterre in Spain. It flows in a southeasterly direction, and after sending a mass of water into the Mediterranean it pursues a southerly course to Cape Mesurada, south of Sierra Leone, keeping at a considerable distance from the land. It then flows rapidly for 1,000 miles due east to the Bight of Biafra, where it seems to mingle with the equatorial current. It is led from the west by the Guinea counter current, a back flow of water between the main and the north equatorial currents. The south connecting current strikes across the South Atlantic from the Brazil current, then turns north, and finally joins the great equatorial current. The South Atlantic or South African current originates north of the Cape of Good Hope, from which it flows in a northwesterly direction, at a rate of from 15 to 30 miles a day, and eventually merges into the equatorial current. Cape Horn current flows constantly from the Antarctic and South Seas into the Atlantic Ocean, its general direction being east-northeast and northeast. Rennel current, which is possibly a continuation of the Gulf Stream, enters the Bay of Biscay from the west, curves round its coast, and then turns northwest toward Cape Clear in Ireland. The Greenland or Arctic current runs along the east coast of Greenland to Cape Farewell; having doubled this cape, it flows up toward Davis Strait, from which it receives an inflow of water, and then turns to the south along the coast of Labrador, and continues along the coast of the United States, from which it separates the Gulf Stream by a cold band of water. Immense masses of ice are borne south by this current from the Polar seas, and carried into warmer regions, where they gradually dissolve and disappear. In the interior of the North Atlantic there is a large area comparatively free from currents, lying between 20° and 30° N. and 30° to 60° W. It is called the Sargasso Sea, from the large quantity of sea weed which drifts into it. A similar area exists in the South Atlantic, to which the same name is occasionally applied by

ATLANTIC TELEGRAPH—ATLAS

analogy, though it is destitute of sea weed. It extends between 20° and 30° S. and 0° and 25° W. Besides the surface currents, recent investigation has established the existence of a general oceanic circulation, consisting of an under current of cold water flowing from the Poles to the equator, and an upper current of warm water from the equator to the Poles.

The winds of the Atlantic are not peculiar to that ocean, but identical with those that prevail in the same latitudes in the other seas around the globe. The most remarkable of these are the perennial or trade winds, which blow constantly in one direction, namely, from east to west, or nearly so. The tract of the trade winds to the north of a zone, which is almost always found on the north side of the equator, is called the region of the northeast trade wind, from blowing one or two points north of east; that to the south, the region of the southeast trade wind, from blowing south of east. The northeast trade wind blows with less steadiness than the southeast, but toward the West India islands it keeps generally steady between east and northeast. The trade winds are constant only at a considerable distance from land, and become more steady the greater the expanse of water over which they blow.

Depths.—The greatest depth yet discovered in the Atlantic is to the north of the island of Porto Rico, in the West Indies, namely, 27,366 feet. Formerly depths of 40,000 or 50,000 feet were reported, but this was owing to defective sounding apparatus. The geography of the ocean bed is now pretty well known, especially in the North Atlantic. Cross-sections of the North Atlantic between Europe and America show that its bed may be represented as exhibiting two great valleys lying in a northerly and southerly direction, and separated by an intervening ridge. Each of these valleys is about 500 miles in width. The mean depth of the east valley is about 14,000 or 15,000 feet, and it can be traced from the equator to the latitude of the Faroes, where it terminates, or over an extent of 3,700 miles. The west valley has a maximum depth of 16,800 feet, and can be traced from the latitude of the Azores as far north as Greenland, where it bifurcates, the deeper portion pointing north up Baffin Bay. The submarine ridge dividing these two valleys appears to be very uniform in depth below the surface, having 1,600 fathoms of water above it from the Azores to the latitude of the Hebrides. It then rises gradually till at last it culminates in Iceland. On this plateau the Atlantic telegraph cables have been laid, and from it the first specimens of deep-sea mud were brought up. This was found on examination by the microscope to consist of a large extent of calcareous shells (*Foraminifera*), not water-worn, but quite perfect, showing that the water at such depths can have little or no motion. No sandy particles were found in the mud. The South Atlantic is not so well known as the North, but so far as soundings yet prove it has not a greater depth than the latter, the greatest depth found being 2,900 fathoms, in lat. 28° S. It would appear to be separated from the North Atlantic by a rocky ridge, on which rest the islands of Ascension, Fernando de Noronha, and St. Paul. The saltness and specific gravity of the Atlantic

differ in various parts, and gradually diminish from the tropics to the poles, and also from within a short distance of the tropics to the equator. In the neighborhood of the British Isles the salt is given as one thirty eighth of the weight of the water. See OCEAN CURRENT.

Atlan'tic Telegraph. See TELEGRAPH.

Atlan'tides, a name given to the Pleiades, the seven daughters of Atlas or of his brother Hesperus.

Atlan'tis, or **Atlan'tica**, a large island traditionally asserted to have once existed in the ocean immediately beyond the Strait of Gades; that is, in what is now called the Atlantic Ocean, a short distance west of the Strait of Gibraltar. Homer, Horace, and some others made two Atlanticas, distinguished as the Hesperides and the Elysian Fields, and believed to be the abodes of the blessed. Plato states that an easy passage existed from the one Atlantis into other islands, which lay near a continent exceeding in size all Europe and Asia. Some have thought this America. Atlantis is represented as having ultimately sunk beneath the waves, leaving only isolated rocks and shoals in its place. Geologists have discovered that the coast line of western Europe did once run farther in the direction of America than now; but its submergence seems to have taken place long before historic times. 'The New Atlantis' is the title which Lord Bacon gives to a literary fragment, in which he sketched out an ideal commonwealth.

Atlan'tis, a romance of the antediluvian world, by Ignatius Donnelly (1882).

Atlan'tosau'rus. See CAMARASAURUS.

Atlas, an extensive mountain system in North Africa, starting near Cape Nun, on the Atlantic Ocean, traversing Morocco, Algiers, and Tunis, and terminating on the coast of the Mediterranean. It is divided into the great and little Atlas. The little Atlas is the range nearest the sea-coast; the great is more inland, and borders on the desert. In fact, however, the two ranges are one and the same system, though sometimes connected only by separate mountains, or ranges of low hills. On the coast, the range skirts the Mediterranean, from Cape Spatel, and the straits of Gibraltar, to Cape Bon, on the northeast of Tunis. The Atlantic shore is sometimes sandy and low, at other times formed by cliffs, which do not attain any great height, except at Cape Ghir. The Mediterranean shore, between Capes Spatel and Bon, is generally rugged, and in places attains a considerable height. Between Cape Bon and the gulf of Gabes it is rocky, but without reaching any great elevation. The southern slope of the Atlas reaches the great desert, from which it is separated by a region of sand hills, shifting with every strong wind, and gradually making encroachments on the fertile lands at the foot of the mountains. On the west of the gulf of Gabes, Mount Nofusa, the last eastern spur of the Atlas, joins Mount Garian, which extends into the regency of Tripoli. The French geographers include within the limits of the Atlas their own province of Algeria, together with the empire of Morocco, and a part of Tunis. The whole area is 500,000 square miles, including a great variety of surface, mountains, valleys, and extensive plains.

ATLAS — ATMOSPHERE

The loftiest peaks form a diagonal line, striking across the general course of the mountains from southwest to northeast. This line begins at Cape Ghir, on the Atlantic, which rises almost perpendicularly from the sea to a great elevation. It then stretches away, east of the meridian of Morocco, then turns abruptly northeast, and from this quarter four important rivers take their rise, the Wady Oum Erbegh (Morbeya), the Mulua, the Tafilet, and the Draa. At this precise spot, the loftiest peaks of the whole mass seem to be brought together, and the most elevated chain runs away north. The principal chain traverses a region called the desert of Ansad, the boundary line between Morocco and Algiers. Here the name great Atlas is first applied. The principal chain recurs in Algeria, where its highest part is called Wanashrees, or Warensenis, and terminates on the banks of the Shelliff, whose valley makes a gap in its course. It reappears southwest of Algiers, in the lofty summits of the Jurjura. From this point, the chain follows a direction parallel to the coast, then it dips again to the southeast, and takes the name of the mountains of Wannooga. Further on to the east, we meet it as the Djebel Aures, and approaching the coast again, it penetrates into the territory of Tunis, under the name of Mount Tipara, terminating at Cape Blanco and Cape Zibeb, on the north of the city of Tunis. The highest summits, the Miltzin (11,400 feet), southeast of the city of Morocco, and other mountains near the Wady Oum Erbegh, and the Mulua, are rarely free from snow. The greatest heights of the entire system are the Jebel Ayashi (14,600 feet), and Tamjurt (14,500 feet). The little Atlas is by no means so lofty, its highest peak, Shelia, having an altitude of only 7,611 feet. The great Atlas is the water-shed of the province. The rivers flowing north from this line force their way through the lesser Atlas to the Mediterranean, while those that take their rise on the southern slope are lost in the marshes of the desert. There are several defiles through the Atlas, the best known of which are those of the Beboonan, leading to Terodant in Morocco, and the Biban, or Iron gate on the east, leading from Algiers to Constantine. The geological constitution of these mountains presents old limestone alternating with a schist, oftentimes passing to a well-characterized micaceous schist, or gneiss. The stratification of the gneiss is also very irregular, only presenting organic débris; then come schistose clays, alternating with secondary limestones; then come limestone with white clays, and iron sands resting on blue clay. This formation is particularly developed near Oran, and the plains in which the soil is formed from it are of great fertility. Volcanic rocks have been found in small quantities. There are veins of iron, copper, and lead. Saltpetre is found near Terodant. About 50 miles from the same town, excellent malleable iron is found. At Elala there are copper and silver mines. The vegetation embraces all the varieties of both temperate and tropical climates. The Atlas was known to the ancients, and the Romans formed several colonies in the district.

At'las, an anatomical term applied to the first vertebra of the neck, which supports the head. It is connected with the occipital bone in such a way as to permit of the nodding

movement of the head, and rests on the second vertebra or *axis*, their union allowing the head to turn from side to side.

At'las, in Greek mythology, the Titan whom Zeus condemned to bear the vault of heaven. The same name is given to a collection of maps and charts, and was first used by Gerard Mercator in the 16th century, the figure of Atlas bearing the globe being represented on the title-pages of such works.

At'lee, Washington Lemuel, American surgeon · b. Lancaster, Pa., 22 Feb. 1808; d. 6 Sept. 1878. He became noted as a pioneer in ovariectomy and the removal of uterine fibroid tumors, and published 'Ovarian Tumors' (1873) 'Struggles and Triumphs of Ovariectomy' (1875), and a prize essay on 'Fibroid Tumors of the Uterus' (1876).

At'midom'eter, an instrument for measuring the evaporation from water, ice, snow, etc. It consists of two glass or metal bulbs, one of them placed above the other, with which it communicates by a narrow neck. The instrument having been immersed in a vessel of water through a circular hole in which the steam rises, distilled water is gradually poured into the pan above, causing it to sink to the point at which the zero of the stem is on a level with the cover of the vessel. As then the water in the pan gradually evaporates, the steam slowly ascends, the amount of evaporation being indicated in grains on the graduated scale.

Atmol'ysis, the separation of the components of a gaseous mixture by means of diffusion. See **DIFFUSION**.

Atom'eter, an instrument invented by Sir John Leslie for measuring the quantity of moisture exhaled in the open air in a given time from any humid surface. It consists of a very thin ball of porous earthenware, from one to three inches in diameter, having a small neck firmly cemented to a long and rather wide tube of glass, to which is adapted a brass cap with a narrow collar of leather to fit closely. It is filled with distilled or pure water, and its cap screwed tightly. It is then suspended out of doors where it is exposed freely to the action of the wind, but sheltered from rain. As the water evaporates from the external surface of the ball, it transudes through its porous substance, and the waste is measured by the corresponding descent of the liquid in the stem. To test the amount of this descent, there is a finely-graduated scale. When the water has sunk to the bottom of the stem, the latter requires to be filled anew.

At'mosphere (Greek, "vaporous sphere"), in ordinary usage, the gaseous envelope that surrounds the earth. The atmosphere consists chiefly of the gases oxygen and nitrogen, not chemically combined, but mechanically mixed in the proportion of about 21 volumes of oxygen to 79 of nitrogen. It also contains small quantities of carbon dioxid, organic matter, water vapor, argon, and other substances. (For a more precise statement of its composition, see **AIR**.) At the surface of the earth it has a density of about 1/800th of that of water, though this varies somewhat with the height above the sea level at which the determination is made, and with the temperature and barometric pressure prevailing at the time. The presence of

ATMOSPHERE

free nitrogen in the atmosphere may be attributed, probably, to the comparative inertness of that gas, so far as any tendency to form chemical compounds is concerned. The presence of free oxygen cannot be explained in this manner, however, because oxygen is one of the most active chemical substances known. It appears more probable that oxygen is present in the free state simply on account of the immense quantity of that element that the earth contains. In past geological times, it combined with practically all of the oxidizable minerals that were near enough to the surface of the earth to be accessible to it, and the present supply of free oxygen in the atmosphere must be regarded as merely the excess of that element that remained unused, after all the possible oxidations had been effected. According to this view, the earth (at least in its more superficial parts) is a gigantic, burned-out cinder; and this accords with the estimates that chemists and geologists make, that nearly one half of the weight of the earth's crust consists of oxygen. It is likely that in past ages, and particularly in the carboniferous period when the vegetation that gave rise to our modern coal fields was flourishing, the quantity of carbon dioxide present in the atmosphere was considerably greater than at the present time. Part of this gas was absorbed by plants, its carbon being stored in the coal beds and its oxygen returned to the air; but it is likely that by far the greater portion combined with lime and other similar earths to produce the present vast deposits of limestone and other carbonated minerals and rocks. At the present day, carbon dioxide is being absorbed from the atmosphere by plants, and returned to it again by animals, and by factories in which coal is burned. We have no means of knowing whether the balance is being preserved, so far as this constituent of the atmosphere is concerned, or not; because the mass of the entire atmosphere is too vast for the composition to be sensibly changed by these causes, since the time when exact analyses became possible.

Galileo observed that water cannot be drawn up by a suction pump or other equivalent device, to a greater distance than about 34 feet. He did not succeed in explaining the existence of this limiting height, but his friend and amanuensis Torricelli, who succeeded him as professor at Florence, afterward made the shrewd guess that water rises in such a pump for the reason that the atmosphere exerts a certain pressure upon all terrestrial objects, and that when a portion of this pressure is removed from the water in the suction tube of the pump, it is the pressure of the atmosphere upon the water external to the pump that causes the water in the pump-tube to rise; and he saw that if that were the case, it would follow that a pump could only "draw" water up to the particular height at which the pressure due to the water-column so "drawn up" would precisely balance that of the atmosphere. The limit of 34 feet corresponds (as is easily shown by a simple calculation) to a pressure of about 15 pounds to the square inch; and hence Torricelli inferred that the atmosphere exerts a pressure of that amount upon all objects. Meditating upon this hypothesis, it occurred to him that if his explanation were indeed correct, the atmosphere would be able to raise mercury (which is about 14

times as heavy as water) to only about one fourteenth of the height to which it can raise water. He accordingly (in 1643) procured a glass tube some 35 inches long, and closed at one end. Placing it with the open end upward, he filled it with mercury. He then covered the open end to prevent the escape of the mercury, and inverted the tube so that its mouth dipped into a basin also filled with mercury. Upon uncovering the open end of the tube, he was gratified to see that the mercury in the tube at once sank until its upper surface stood at about 30 inches above that in the basin. This experiment proved that the atmosphere exerts a pressure equal to that due to a column of mercury 30 inches high, or, in other words, equal to about 14.7 pounds per square inch. Additional proofs were soon given, also. Thus Pascal suggested that if the explanation were true, the pressure ought to be less at the top of a mountain, than in a lower place; because the mountain projects up into the atmosphere so far that there is a sensibly smaller height of air above it than there is above a point in a valley. The experiment was actually carried out by M. Perrier, who carried an apparatus like Torricelli's (now known as a "barometer") to the summit of a mountain in Auvergne called the Puy de Dôme, and found at the top of this mountain (which is 4,800 feet high) the atmosphere could sustain only about 27 inches of mercury, although after returning to the plains below, the full height of 30 inches was again observed. Shortly afterward (in 1650) the air-pump was invented by Guericke, and the pressure of the atmosphere was demonstrated beyond any doubt whatever, by numerous direct experiments.

The pressure of the atmosphere varies somewhat from day to day, and even from hour to hour, as well as with the latitude and with the height above the sea. For scientific purposes the normal atmospheric pressure is now generally taken to be equal to the pressure due to a column of pure mercury 760 millimeters (29.9212 inches) high, at the level of the sea, in latitude 45°; the mercury being at the temperature 32° F. The pressure so defined is called an "atmosphere"; or, more briefly and conveniently, an "atmo." The "atmosphere" of pressure, as so defined, is nearly equal to a pressure of one million dynes per square centimeter, and it has therefore been proposed to take one million dynes per square centimeter as the standard atmosphere of pressure, calling it an "absolute atmosphere," because the dyne is a unit in the "absolute system" of units. This proposal has not yet been adopted by physicists to any great extent. See UNITS.

Knowing the pressure exerted by the atmosphere upon each square inch of the earth's surface to be about 14.7 pounds, and knowing the dimensions of the earth, it is not difficult to calculate the total weight of the entire atmosphere. The calculation, when performed, shows that the mass of the atmosphere is about 1/1,000,000th of that of the whole earth.

If the atmosphere were of uniform density, it would be easy to calculate the height to which it extends. We should only have to divide the pressure upon one square inch of the earth's surface by the weight of a cubic inch of the air, and the quotient would be the height of the

ATMOSPHERIC ENGINE—ATMOSPHERIC RAILWAY

atmosphere, in inches. Thus a cubic inch of air, at a pressure of 30 inches of mercury and at the temperature of freezing water weighs about 0.000749 of an ounce; and as a column of mercury 30 inches high exerts a static pressure of about 235.8 ounces, it follows that if the atmosphere were homogeneous (that is, of uniform density throughout), its height would be about $235.8 \div 0.000749 = 314,000$ inches, or 4.97 miles, when the air has a temperature of 32° F., and the barometric pressure is 30 inches. The height so calculated is convenient for use in certain physical computations, and is called the "height of the homogeneous atmosphere." If we turn from this problem to the more difficult one of determining the *actual* height of the atmosphere, we find that no satisfactory results can be given. As we go up, the strata become rarer and rarer, for the reason that the lower layers are weighed down and compressed by those above, and at increasing heights there is less and less air above, to exert this compression. At great heights the atmosphere becomes more and more attenuated, and thins out by insensible gradations into a perfect vacuum. There is no definite boundary, immediately below which there is an atmosphere, and immediately above which there is none. Glaisher and Coxwell, in their famous balloon ascension of 5 Sept. 1862, attained an actual elevation of over 29,000 feet, and observed a barometric height of 95 inches (corrected); but it is certain that the atmosphere extends far higher than this. Some estimates, based on the calculated heights of shooting stars when they first become luminous, place the limit at which the atmosphere has a density sufficient to produce any observable effects, at about 200 miles; but, as has been pointed out above, all estimates of this kind are necessarily indefinite and unsatisfying. (For some of the questions raised in connection with the limits of the atmosphere, see GASES, KINETIC THEORY OF.)

The atmosphere, as might be expected from its relatively great depth, exhibits an absorption spectrum (see SPECTROSCOPE), and this varies to a certain extent from time to time. A portion of this absorption spectrum is due to the presence of water vapor, and the "rain bands" in the spectrum have been utilized to a limited extent (though not very generally) in connection with weather predictions. It is also known that the atmosphere is less transparent to the rays at the blue end of the spectrum than to those in the middle and toward the red end. The experiments of Professor S. P. Langley, on the expedition of the United States Signal Service to Mount Whitney, demonstrated that this selective absorption is so great that the sun would appear distinctly bluish, instead of white or yellowish as it does under actual conditions, if we could see it from a point outside of our own atmosphere. (See Langley, 'Researches on Solar Heat,' 1884.)

Little is yet known concerning the electrical phenomena of the atmosphere. In clear, calm weather, the atmosphere appears to be always positively electrified, with respect to the earth, and the difference in potential increases greatly during snow storms and high winds. In thunder storms it is subject to sudden and violent oscillations, as might be expected. Many theories have been proposed to account for the

electrification so observed, particularly for the enormously high potentials that are in evidence during thunder storms; but none has yet met with general acceptance. It was formerly thought that the evaporation and condensation of water had much to do with it, but no experimental evidence has been adduced to justify this hypothesis, although physicists have given it the most careful attention. Bartoli and Pettinelli made exhaustive experiments in connection with it, both with water and with organic compounds; but always without obtaining any favorable results. Kelvin, MacLean, and Gall observed electrification when dry air bubbled through a liquid, the air being electrified negatively in the case of pure water, and positively in the case of sulphuric acid or salt water. Apparently these are all friction phenomena, and it is not certain that they have any bearing on the electrical phenomena of the atmosphere. We know, from numerous experiments, that dust facilitates the condensation of aqueous vapor, and numerous authorities have endeavored to trace a similar connection between dust and the development of high electric potentials in the atmosphere. No certain results have been attained, however, as may be judged from the fact that in the 12 years immediately preceding 1902, no less than 25 new thunder-storm theories were proposed, 6 of these being published during the year 1895. See also METEOROLOGY; WIND.

Atmospheric Engine, an early form of pumping engine, invented by Papin in 1695 and subsequently improved by Newcomen and Watt. The steam cylinder is vertical and single acting, the piston being alternately forced upward by steam, and downward by the pressure of the atmosphere. See STEAM AND STEAM ENGINE

Atmospheric Line. See INDICATOR.

Atmospheric Railway, a railway in which the propulsive force designed to move the carriages along is that of the atmosphere. The notion of such a method of locomotion seems first to have suggested itself, in the latter part of the 17th century, to the French physician Papin, whose name is forever associated with the celebrated digester. In 1810, Mr. Medhurst published a work entitled 'A New Method of Conveying Letters and Goods by Air.' His proposal was to construct a close tunnel, in which the carriages,—the last of them provided with a piston fitting the tunnel,—should be propelled by air forced in behind them. Vallance, of Brighton, in 1825, recommended, as an improvement on this plan, the exhaustion of the air in front. About 1835, Henry Pinkus, an American, residing in England, patented a scheme for placing the carriages in the open air, but connecting them below with a small tunnel, having a narrow slit above, with ingeniously constructed apparatus to render the tunnel temporarily air-tight, notwithstanding the slit. Not much was done to carry out the patent; and Pinkus' scheme of what he called a pneumatic railway was considered as having failed, when, in 1840, Messrs. Clegg and Samuda brought forward a somewhat similar project under the name of the "Atmospheric Railway." An experimental fragment of line laid down near Wormwood Scrubs, just outside of London, on the Great Western line, was successful, as was

ATOLL—ATOMIC THEORY

one designed for actual use from Kingstown to Dalkey, in Ireland, another between London and Croydon, and a third in South Devon; but these have been since abandoned, and all that now remains to represent this mode of propulsion is the pneumatic dispatch tube, used for transmitting parcels to short distances. See WIRE-ROPE.

Atoll, a-töl', the Polynesian name for coral islands of the ringed type enclosing a lagoon in the centre. They are found chiefly in the Pacific in archipelagos, and occasionally are of large size. Suadiva Atoll is 44 miles by 34, and Rimsky 54 by 20. See CORAL ISLANDS.

Atomic'ity. See VALENCY.

Atomic Theory, in chemistry, the theory whose fundamental doctrine is that all matter is composed of ultramicroscopic particles, separated by spaces either entirely destitute of matter, or at least containing it in a very attenuated state. Such a theory was taught by Lucretius and other ancient philosophers, but the views of these early writers were necessarily vague and indefinite, and the atomic theory, as held by chemists of to-day, is generally attributed to the English scientist, John Dalton. In the early part of the 19th century Dalton called attention to the fact that when substances combine chemically they do so in certain definite proportions. His reasoning was something like this: In 100 pounds of carbon monoxid there are 42.9 pounds of carbon, and 57.1 pounds of oxygen. In the same weight of carbon dioxid there are 27.3 pounds of carbon, and 72.7 pounds of oxygen. These are merely experimental facts, obtainable by direct analysis, and they involve no hypothesis whatever. No particular relations are discernible among the numbers stated above; but Dalton discovered that if the same facts are stated in a different way, a very remarkable relation appears. Thus, suppose we calculate what weight of oxygen is combined *with each pound of carbon* in the two gases. In carbon monoxid we find that there are $57.1 \div 42.9 = 1.33$ pounds of oxygen to each pound of carbon, and in carbon dioxid we find that there are $72.7 \div 27.3 = 2.66$ pounds to each pound of carbon. One of these numbers being exactly twice the other, we conclude that carbon can unite with oxygen in two proportions, the quantity of oxygen, per unit weight of carbon, being twice as great in one case as in the other. Dalton observed similar relations among other compounds,—in fact, his theory first occurred to him while he was studying the simpler compounds of carbon and hydrogen; and after turning the matter over in his mind he came to the conclusion that the facts can best be explained by assuming that matter consists of exceedingly minute, indivisible particles or atoms, each of which has a definite weight. When two bodies combine chemically, he conceived their atoms to come together in pairs, or in threes, or fours, according to the compound formed; and he devised symbols to represent the various elementary bodies and their compounds. Thus oxygen was represented by a circle with a white centre, hydrogen by a circle with a dot in the centre, nitrogen by a circle crossed by a vertical straight line, and carbon by a solid black circle. His notation has no advantages over the one now in com-

mon use, and hence, in what follows, we shall adopt the modern symbols. As water was the only compound of oxygen and hydrogen that Dalton knew, he naturally represented it by the symbol OH, considering that in it the particles of oxygen and hydrogen are united in *pairs*. Taking the hydrogen atom as the unit, it follows that the weight of the oxygen atom must be 8, if Dalton's view of the composition of water is correct; for experiment shows that in a given mass of water there is eight times as much oxygen, by weight, as there is hydrogen. Carbon monoxid was represented by the symbol OC, and since for each unit of its oxygen (by weight) this gas contains $\frac{3}{4}$ of a unit of carbon, it follows that the atomic weight of carbon is $\frac{3}{4}$ of that of oxygen. Hence the weight of the carbon atom is 6, the weight of the hydrogen atom being arbitrarily taken, as before, as 1. Carbon dioxid was represented by the symbol OCO. Ammonia gas, being the only compound of hydrogen and nitrogen known to Dalton, was represented by the simple symbol NH, and since experiment shows that ammonia gas contains (by weight) $4\frac{2}{3}$ times as much nitrogen as hydrogen, the atomic weight of nitrogen must be $4\frac{2}{3}$, or 4.67. In presenting the foregoing sketch of Dalton's views, use has been made of better experimental data than were available in his time, in order that the relation of his system of atomic weights to the modern system may be more clearly seen. A few of his actual determinations of atomic weights, from the imperfect data that he had, are given in the accompanying table. These were published in

Element	Atomic Weight
Hydrogen	1 0
Nitrogen	4 2
Carbon	4 3
Phosphorus	7 2
Oxygen	5 5

1805, and his general theory of chemical compounds was given in the first volume of his 'New System of Chemical Philosophy,' published in 1808. All subsequent researches have tended to confirm Dalton's fundamental conception, that matter is discontinuous in its ultimate nature, and consists of discrete atoms which come together in definite groups when chemical combination occurs. And we agree with him, to-day, in the belief that the so-called "atomic weights" of substances are really the *true relative weights of their atoms*; the weight of the hydrogen atom being taken as unity. Soon after Dalton's theory had been announced, it was observed that there are simple *volumetric* relations among *gases* when they combine. Thus it was noticed that 2 volumes of hydrogen combine with 1 volume of oxygen to form water; that 1 volume of hydrogen combines with 1 volume of chlorine to form 2 volumes of hydrochloric acid gas; and so on. This being the fact, it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of constituent particles per unit of volume. This principle, known as "Avogadro's Law," has been of the greatest service to chemistry. Its truth was long questioned, but as it has led to results of great value, and has been found to be in conformity with all other known facts of

ATOMIC THEORY

chemistry, it is now accepted without reserve as a fundamental principle of nature. Moreover, the kinetic theory of gases has shown that it is a mathematical necessity, if gases are admitted to consist of elastic particles, flying about through space, and colliding with one another, and with the walls of their containing vessels. (See GASES, KINETIC THEORY OF.) But if Avogadro's law be admitted to be a fact of nature, it becomes necessary, at once, to make an important modification in Dalton's theory. For it is plain that if 1 cubic inch of hydrogen, containing (say) n atoms, combines with 1 cubic inch of chlorine, also containing n atoms, to produce 2 cubic inches of hydrochloric acid gas, containing n constituent particles altogether, then the number of such particles in each cubic inch of the hydrochloric acid gas is only $n \div 2$; whereas Avogadro's law requires us to admit the existence of n particles per cubic inch, in the compound gas as well as in each of its constituents. It follows, therefore, that when the H and the Cl combine, their ultimate particles do not simply unite in pairs. There is no way to explain the observed facts, consistently with Avogadro's law, unless we assume that the ultimate particles of H and Cl are both compound, and that when these gases combine, their particles split in two, half a particle of the one combining with half a particle of the other, to produce a whole particle of HCl. In other words, Avogadro's law compels us to admit that the little corpuscles of which matter is composed, and which we have heretofore called atoms, are really (in some cases, at least) systems composed of still smaller bodies. To distinguish between the two kinds of particles—namely, between the systems and their component bodies—it therefore becomes necessary to introduce a new term. The systems are called "molecules" (literally, "tiny masses"), and their constituent parts are still called "atoms." To put the case in another way, the smallest parts into which a given substance can be conceived to be divided, without changing its chemical character, are called "molecules"; while the word "atom" is reserved for the smallest portion of a substance that can enter into a chemical combination. A molecule is a system of atoms capable of independent existence; and an atom is one of the parts into which the molecule of a substance divides, as a preliminary to entering into a chemical combination.

We have but little information, up to the present time, concerning the number of atoms entering into the molecules of the different elements. The molecules of cadmium, mercury, zinc, and indium are believed to be monatomic, at least when those bodies are in the gaseous state; so that in these cases there is no difference between a molecule and an atom. The same is apparently true of the newly discovered gases, argon, helium, neon, krypton, and xenon. Hydrogen, nitrogen, oxygen, selenium, and tellurium are believed to be diatomic; that is, their molecules are believed to contain two atoms each. Phosphorus and arsenic are believed to be tetratomic, their molecules containing four atoms each. Chlorine, bromine, and iodine are diatomic at temperatures below 1100° F., but above 1100° their molecules are believed (by some authorities) to break up into single

atoms, so that at about 2200° F. two thirds of the little particles present in these substances are free atoms, while the remaining one third continue to exist as diatomic molecules. Sulphur is hexatomic at 900° F., but its molecules break up somewhat at higher temperatures, and are practically all diatomic above 1500° . According to this view of the case, if H stands for the atom of hydrogen and Cl for the atom of chlorine, what happens when a molecule of one of these gases combines with a molecule of the other is not simply $H + Cl = HCl$, because the molecule of hydrogen must be represented by H_2 and that of chlorine by Cl_2 . Hence the process of combination consists of two parts, the first of which is

The atoms of hydrogen and chlorine, thus set free, then combine to form hydrochloric acid, in the following manner:

or we may write the whole operation in the following simple manner:

Dalton, assuming that the formula of ammonia is NH , and knowing by experiment that the weight of the nitrogen present is 4.67 times as great as the weight of the hydrogen, would conclude that the atomic weight of nitrogen is 4.67; but since experiment shows that when ammonia gas is separated into its constituent elements, 2 volumes of the ammonia yield 1 volume of nitrogen and 3 volumes of hydrogen, Avogadro's law requires us to conclude that the true formula for ammonia is NH_3 ; and hence we must take $3 \times 4.67 = 14$ as the atomic weight of nitrogen. This example will suffice to show how Avogadro's law obliged chemists to modify the atomic weights that would be obtained by the methods known to Dalton. Direct analysis of compounds of an element whose atomic weight is desired will give either that atomic weight itself, or some simple multiple or submultiple of it; but to decide between these several multiples (as for example between 4.67 and 14, in the case cited above), it is necessary to have recourse to Avogadro's law, or to some other equally general principle. Unfortunately Avogadro's law cannot always be applied to the determination of atomic weights, because it frequently happens that no compound of the element under examination can be obtained in the gaseous condition, or that the gaseous compounds that can be obtained are unsatisfactory, for one reason or another, and not adapted to the determination of the particular multiple that should be selected as the atomic weight of the element. In such cases recourse may be had to the law of Dulong and Petit, or to the "periodic law" of Meyer and Mendeléeff. In 1819 two distinguished French physicists, MM. Dulong and Petit, announced that the specific heats of 13 elements upon which they had made careful experiments are inversely proportional to the respective atomic weights of those elements. In other words, that the product of the specific heat and the atomic weight (which product is called the "atomic heat") is the same for all of them. This remarkable generalization did not meet with universal and immediate acceptance, because it failed in numerous cases unless the

ATOMIC THEORY

atomic weights of the corresponding elements were changed somewhat from the values that had been previously assigned to them from purely chemical considerations. Thus in the case of bismuth, platinum, silver, and cobalt, Dulong and Petit substituted multiples or submultiples of the atomic weights then in use; and other changes were also made. Moreover, the law could not possibly be exact, because the specific heats of bodies are not constant, but vary with the temperature, and sometimes to a considerable extent. Subsequent experimenters have paid great attention to Dulong and Petit's law, however, and now that the atomic weights of the more familiar elements have been pretty well determined in one way and another, the law is found to be surprisingly near to the truth, and most of the changes for which they contended, in connection with previously accepted atomic weights, have since been made. A list of ten elements whose specific heats have been well determined are presented in the table, to illustrate the degree of accuracy with which

Element	Atomic Weight	Specific Heat	("Atomic Product Heat")
Lithium	7.	0.941	6.6
Aluminum	27.	0.214	5.8
Potassium	39.	0.166	6.5
Copper	63.	0.0952	6.0
Silver	107.	0.0570	6.1
Antimony ..	119.	0.0508	6.1
Tungsten ..	183.	0.0334	6.1
Gold	196.	0.0324	6.4
Bismuth	207.	0.0308	6.4
Uranium ..	238	0.0277	6.6

a proposed element may be expected to conform to it. The atomic weights in the table range from 7 to 238, and yet when we multiply each one by the corresponding specific heat, we find that the product (or "atomic heat") remains constant, or nearly so. In some cases (notably for boron, silicon, and carbon), a large deviation from the law is observed; but these exceptions cannot be considered in the present place. As an example of the use of Dulong and Petit's law, the case of silver may be cited. Previous to the publication of that law, the atomic weight of silver had been taken at 215. Dulong and Petit pointed out that if this value were retained, the product of the atomic weight and the specific heat greatly exceeded the value 6, to which many of the other elements approximated. They therefore proposed to halve the then accepted atomic weight of this element, and to make (of course) a corresponding change in the formulas of all compounds of silver. Regnault confirmed their experiments, and repeated their demand that the atomic weight be halved. But Berzelius, then the greatest living authority on such matters, refused to consent to the change, on the ground that silver and sodium compounds are isomorphous (see ISOMORPHISM), and that the analogy between the formulas of their corresponding compounds would be destroyed, if the atomic weight of silver were halved, while that of sodium was left unchanged. Regnault then determined the specific heat of metallic sodium, and showed that the atomic weight of that element should also be halved, in order for it to conform to Dulong and Petit's law. Berzelius' objection thus lost its force, and the atomic weights of both silver and so-

dium were ultimately halved, by universal consent. The "periodic law," already referred to, cannot be adequately treated in this place (see PERIODIC LAW); but it may be said that when the known elements are arranged in the order of their atomic weights, it is found that certain attributes recur in a remarkable "periodic" manner, as we pass from one end of the array to the other. This fact is of great assistance in the determination of atomic weights, because any great error in the assignment of the atomic weight of an element would throw that element, among others with which it would have relations, entirely out of harmony with those that prevail in other parts of the array. This "periodic" classification is so powerful and far-reaching, that the existence of new and previously unsuspected elements has been predicted by it, and afterward verified (in some cases) by the actual discovery of the elements themselves. The newly discovered gas "argon" (q.v.) affords an interesting case of the determination of an atomic weight by indirect means. Argon has resisted all attempts to make it combine with other substances, and hence it has been impossible, thus far, to analyze any of its compounds. Its density was found, by direct experiment, to be about 20 times as great as that of hydrogen. Now if, as Avogadro's law states, a cubic inch of argon contains just as many molecules as a cubic inch of hydrogen (under the same conditions of temperature and pressure), then it follows that a molecule of argon weighs 20 times as much as a molecule of hydrogen, or 40 times as much as an *atom* of hydrogen. To find the weight of an atom of argon we therefore merely have to divide 40 by the number of atoms that there are in its molecule. For an explanation of the method by which the number of atoms in the molecule of such a gas is obtained, we must refer to the article GASES, KINETIC THEORY OF; it will suffice, in the present place, to state that it was found that argon is monatomic, its molecule containing but a single atom. Therefore the conclusion was, that the atomic weight of argon is about 40. The "periodic law" was not of any great service in this case, because the properties of the new gas proved to be so unlike those of any previously known substance that its proper place in the general scheme could not be even guessed until its atomic weight had been determined. The subsequent discovery of helium and the other inert gases of the same group showed, however, that the atomic weight already assigned to argon is in reasonably good accordance with the periodic law.

Chemists educated in recent years can hardly conceive the confusion that prevailed half a century ago, while the principles that have been outlined above were struggling for recognition and universal adoption. There was no agreement as to what atomic weights nor what formulas should be used. Mendeléeff says: "Some took $O=8$ and others $O=16$. Water in the first case would be HO and hydrogen peroxid HO_2 , and in the second case (as is now generally accepted) water would be H_2O and hydrogen peroxid H_2O_2 , or HO . Discussion and confusion were reigning. In 1860 the chemists of the whole world met at Carlsruhe for the purpose of arriving at some agreement on the subject. There was great difference of opinion,

ATOMIC THEORY

and a conditional agreement (or compromise) was proposed and defended with the greatest acumen by the ranks of science. A conditional agreement was not arrived at, and ought not to have been; but instead of it, truth, in the form of the law of Avogadro-Gerhardt, received by means of the Congress a wider development, and soon afterward conquered all minds. Then the new so-called Gerhardt atomic weights established themselves, and in the seventies they had already become generally used. As soon as a few of the atomic weights had been determined with some little degree of precision, it became evident that they came nearer to exact integers than one would naturally expect them to, judging from the theory of probability. As early as 1815, Prout made the assumption (since known as "Prout's Hypothesis") that the true values of these atomic weights are really integral numbers; and he drew the inference that all elements are composed of hydrogen. Thus nitrogen, whose atomic weight is almost exactly 14, he believed to contain 14 times as many atoms to the molecule as hydrogen contains, and he believed the fundamental atom to be the same in each case. There is nothing about this assumption which conflicts with what has been said above about nitrogen being a *diatomic* gas; for all that Avogadro's law positively shows is that when a molecule of that gas divides, it splits into *halves*, and therefore contains an even number of atoms. In the absence of any evidence to the contrary we assume it to be simply *diatomic*, although we must always remember that future research may require us to admit it to be *tetratomic*, *hexatomic*, or even more complex. Prout's hypothesis has provoked a great deal of discussion, and since it was first proposed it has been attacked and defended by many distinguished chemists; and although rather in disfavor at present, we can hardly yet say that it has been finally laid to rest. One can scarcely glance at a table of atomic weights (such as that here presented) without being impressed by the manifest tendency shown by these atomic weights to approach integral values. Of course there are conspicuous exceptions—chlorine, for example—but the fact that many of the atomic weights are nearly integral demands some sort of an explanation. What that explanation may ultimately prove to be, we cannot now guess; but it is possible that it will be found in the development of the remarkable corpuscular hypothesis of Prof. J. J. Thomson. (See ELECTRON.) The atomic weight of oxygen was long thought to be precisely 16; very careful experiments then indicated that 15.96 is a closer approximation to the real fact; and it has recently been ascertained that 15.88 is a still better approximation. It is a matter of choice what element is taken as having the atomic weight unity, hydrogen having been chosen for this purpose merely because it is the lightest element known. For many purposes it would be convenient if the atomic weight of oxygen were precisely 16; but this value is now known to be incompatible with the assumption that the atomic weight of hydrogen is 1. Chemists have therefore been in the habit, in recent years, of multiplying all the atomic weights, as deduced on the hypothesis that $H=1$, by a constant number, so determined as to make the atomic weight of oxygen come precisely 16. It

happens that this number is 1.008, and this is therefore the atomic weight that must be assigned to hydrogen, if we are to adopt a scale on which the atomic weight of oxygen is to be precisely 16. A majority of the chemists of the world now use this modified scale, on which the atomic weight of hydrogen is taken as 1.008, and the scale so established is known as the "International" scale of atomic weights. A table of the atomic weights of the elements, both for $H=1$, and for $O=16$, is presented herewith.

TABLE OF ATOMIC WEIGHTS

Element	Symbol	Atomic Weight	
		H=1	O=16
Aluminum....	Al	26.9	27.1
Antimony	Sb	119.1	120
Argon	A	39.6	39.9
Arsenic.....	As	74.4	75.
Barium	Ba	136.4	137.4
Bismuth	Bi	206.9	208.5
Boron	B	10.9	11.
Bromine.....	Br	79.36	79.96

Zinc.....	Zn	64.9	65.4
Zirconium...	Zr	90	90.7

ATOMIZER—ATRIUM

The many questions that suggest themselves as to the size and physical nature of atoms belong properly to the domain of physics, and are discussed under the heading **MOLECULAR THEORY**. The day will doubtless come when the physicist and the chemist will find some common ground for the discussion of the nature of atoms and molecules; but at present these two sciences deal with such widely different classes of phenomena that no such common ground can be discerned. The atom and the molecule of the physicist appear to be hardly capable of possessing the properties that the chemist demands; but it is likely that this difficulty will one day be overcome. See **CHEMISTRY**; **ELECTRON**; **MOLECULAR THEORY**; **GASES**; **KINETIC THEORY**; **OF**; **VALENCY**; **SPECTROSCOPE**; **PERIODIC LAW**.

Atomizer. For the forms of atomizer used in burning liquid fuel, see **PETROLEUM**.

Atone'ment, in Christian theology, the special work effected by the life, sufferings, and death of Christ. The first explicit exposition of the evangelical doctrine of the atonement is ascribed to Anselm, Archbishop of Canterbury, in the 'Cur Deus Homo' (1098). See Shedd, 'History of Christian Doctrine'; Maurice, 'Theological Essays' (1853); Hodge, 'The Atonement' (1886); Dale, 'The Atonement' (1885); Oxenham, 'The Catholic Doctrine of the Atonement' (1881).

Atos'sa, the daughter of Cyrus, 530 B.C. She was successively married to Cambyzes, Smerdis, one of the Magi, and Darius, son of Hydaspes, the last of whom she incited to invade Greece. The word served as a poetical name given by Pope, in his 'Moral Essays,' to Sarah, Duchess of Marlborough.

Atrato, a-tra'tō, a river of Colombia, of note, because it has repeatedly been made to bear a part in schemes for a ship-canal across the Isthmus of Panama. Rising on the Western Cordillera at an altitude of 10,560 feet, above sea-level, it runs 305 miles northwest through low, swampy country and falls by several mouths, interrupted by bars, into the Gulf of Darien. It is navigable by steamers for fully 250 miles, being 750 to 1,000 feet wide, and 8 to 70 feet deep. A route, surveyed by the United States government in 1871, proposed to connect the Atrato and the Jurador, flowing into the Pacific, by a canal 48 miles long. At the Paris International Congress (1879), that route was, with various others, discussed and rejected in favor of De Lesseps' line from Limon to Panama. Gold-dust is found in and about the Atrato.

Atrau'li, a town of India, in the northwest provinces. It is clean, well built, and has a good trade. Pop. 14,374.

Atrebrates, a-trēb'a-tēz, or āt're-bā'tēz, the ancient inhabitants of that part of Gallia Belgica afterward called *Artois*. A colony of them settled in Britain, in a part of Berkshire and Oxfordshire.

Atrek, a-trēk', a river of Asia, forming the boundary between Persia and the Russian Transcaspian territory, and flowing into the Caspian. Its length is over 300 miles.

Atreus, ā'troos, in fabulous history, the son of Pelops and Hippodamia. He and his brother, Thyestes, murdered their half-brother, Chrysippus, from jealousy of the affection en-

tertained for him by their father. Thereupon they fled to Eurystheus, with whose daughter, Aerope, Atreus united himself, and after the death of his father-in-law became king of Mycenae. Thyestes had two sons by the wife of his brother, and was banished by Atreus. Thirsting for revenge, Thyestes conveyed away secretly a son of his brother, and instigated him to murder his own father. This design was discovered, and the youth, whom Atreus thought to be the son of his brother, was put to death. Too late did the unhappy father perceive his mistake. A horrible revenge was necessary to give him consolation. He pretended to be reconciled to Thyestes, and invited him with his two sons to a feast, and after he had caused the latter to be secretly slain he placed a dish made of their flesh before Thyestes. When the father had finished eating Atreus brought the bones of his sons and showed him the dreadful revenge which he had taken. Atreus (or his son Pleisthenes) was the father of Agamemnon and Menelaus, who are hence called the Atridae, Atridēs (the singular) being often distinctively applied to Agamemnon.

A'treus, Treasury of, a subterranean building at Mycenæ, so styled by Pausanias and frequently referred to as "the tomb of Agamemnon." It is a vaulted tomb resembling a bee-hive in construction, its arch being composed of projecting horizontal courses of stone narrowing as the top is approached. It contains a circular chamber 50 feet wide with a smaller square one adjoining.

Atri, a'tre, Italy, the ancient *Adria*; a town of the province of Teramo, in Italy, 14 miles southeast of the city of Teramo, on the Brindisi R.R. There are some ruins of ancient walls and buildings. The cathedral is interesting for its frescoes, and a 15th-century painting of the Madonna worshipping the child. It manufactures silk, soap, and licorice. Pop. (1901) 13,448.

A'triplex, a large genus of succulent plants of the natural order *Chenopodiaceæ*, widely distributed in tropical and temperate climates. Many of the species are weeds, but some, known as saltbush (for example, *A. leptocarpa* and *A. semibaccata*) are used as forage plants in Australia, where they are native upon the alkali soils. They have also proved promising in the alkali soils of the western United States. (Consult Circular 3, Division of Agrostology, United States Department of Agriculture, Washington.) *A. hortensis*, orach (q.v.) or sea-purslane, an erect annual herb with yellowish-green or red leaves, was formerly very popular as a substitute for spinach and is still so used to some extent. A few species are also cultivated for ornament.

A'trium, the entrance hall and most important apartment in ancient Roman houses. It was usually ornamented with statues and various family relics, and in the roof there was an opening called the *compluvium*, toward which the roof sloped so as to throw the rain-water into a cistern in the floor known as the *impluvium*. In this room the nuptial couch was placed, and here the matron with the women of the household sat and spun. It was also used as a reception room for visitors and clients. In mediæval times, till the 12th century, the name was given to a cov-

ATROPA — ATTAINDER

ered court, somewhat on the model of the ancient atrium, constructed in front of the principal doors of an edifice. Later the cloister at the side of the church, for the use of the monks, took the place of the atrium.

At'ropa, a genus of plants of the natural order *Solanaceae*. Its best known species is probably *A. belladonna*. See BELLADONNA.

Atrophy, a term denoting a diminution in the size of the organs, or tissues that make up the body. It is part of the physiological process in its simpler forms, as many parts of the body atrophy and become of secondary service in adult life; the thymus gland and umbilical vessels being examples. It may also be a symptom of disease, particularly in affections of the nervous system in which the trophic fibres of an organ are involved. It may also indicate a perverted state of nutrition. See NUTRITION.

At'ropine, a crystalline alkaloid obtained from the deadly nightshade. It is extremely poisonous. Large doses cause delirium, convulsions, and finally stupor and death. It is employed for several purposes in medicine, to relieve pain or spasm, and to arrest excessive sweats. The physiological action of atropine is chiefly exerted on the nervous system. It is a strong stimulant, particularly of the motor and respiratory centres, and paralyzes the end filaments of many nerves, particularly those that supply the secretory glands, the involuntary muscles, and the heart. Its chief poisonous symptoms are, in the stage of excitement, dryness of the mouth and pharynx, with anesthesia, a hot dry skin, dilatation of the pupil with blurred vision, due to paralysis, extreme restlessness, due to the motor excitation, a noisy, busy, and incoherent brain action, perhaps a delirium, quickened pulse, quickened respiration. This stage may pass into one of depression in which the patient becomes comatose, the pulse and respiration become slowed and death results from asphyxia. Treatment of the poisoning should include prompt washing of the stomach, emetics being of no service because of the anesthesia, artificial respiration, infusions of hot coffee, and general supportive measures. See BELLADONNA; SOLANACEÆ.

Atropos, ā'trō-pōs, the eldest of the Fates, who cuts the thread of human life with her shears.

Atsuta, at-soo'ta, Japan, a town in the southern part of Honshu, practically a suburb of Nagoya, with which it is connected by rail. It contains a number of Shintoese temples, in one of which the sword forming part of the Japanese imperial regalia, is kept. Pop. (1898) 24,291.

Attaché, a'tā'sha', a military, naval or subordinate member of the diplomatic service attached to an embassy or legation. Modern usage in effect restricts the term to subordinate officers of an embassy or legation.

Attach'ment, in law, a taking of a person, goods, or estate by virtue of a writ or precept. It is distinguished from an *arrest* by proceeding out of a higher court by precept or writ, whereas the latter proceeds out of an inferior court by precept only. An arrest lies only against the body of a person, whereas an attachment lies

often against the goods only, and sometimes against the body and goods. It differs from a *distress* in that an attachment does not extend to lands, while a distress cannot touch the body. In the United States attachment may be defined as the taking into the custody of the law the person or property of one already before the court, or whom it is sought to bring before the court; also a writ for this purpose. To some extent it is of the nature of a criminal process. In some States a plaintiff can at the beginning of an action to recover money attach the property of the defendant as a security for the payment of the judgment expected to be recovered; and in case of recovery the property is applied in satisfaction of the judgment. But the more usual rule is that there can be no seizure of property, except in specified cases, till the rights of the parties have been settled by judgment of the court. The exceptions are chiefly in cases where the defendant is a non-resident or a fraudulent debtor, or is attempting to conceal or remove his property. In some States, attachments are distinguished as foreign and domestic—the former issued against a non-resident having property with the jurisdiction of the State, the latter against a resident in the State; jurisdiction over the person or property being necessary for an attachment. An attachment issued under a State law not adopted by Congress, or by a rule of court, cannot be sustained in a United States court. Money due to a seaman for wages is not attachable in the hands of a purser, the purser being a distributing agent of the government, and in no sense the debtor of the seaman.

Attack', a term denoting the opening act of hostility by a force seeking to dislodge an enemy from its position. It is considered more advantageous to offer than to await attack, even in a defensive war. The historic forms of attack are: (1) The parallel; (2) The form in which both the wings attack and the centre is kept back; (3) The form in which the centre is pushed forward and the wings kept back; (4) The famous oblique mode, dating at least from Epaminondas, and employed by Frederick the Great, where one wing advances to engage, while the other is kept back, and occupies the attention of the enemy by pretending an attack. Napoleon preferred to mass heavy columns against an enemy's centre. The forms of attack have changed with the weapons used. In the days of the pike, heavy masses were the rule, but the use of the musket led to an extended battle front to give effect to the fire.

Attain'der, the legal consequence of a sentence of death or outlawry pronounced against a person for treason or felony, the person being said to be attainted. It resulted in forfeiture of estate and "corruption of blood," rendering the party incapable of inheriting property or transmitting it to heirs; but these results now no longer follow. Formerly persons were often subjected to attainder by a special bill or act passed in Parliament. In the United States, the Federal Constitution declares that "No bill of attainder shall be passed, and no attainder of treason, in consequence of a judicial sentence, shall work corruption of blood or forfeiture except during the life of the person attainted."

ATTAIN — ATTERBURY

Attain', a writ at common law against a jury for a false verdict. It was abolished in England in 1825 except as to jurors guilty of embezzlement. See **ATTAINER**.

At'tal'ea, a genus of about 20 species of mostly tall, smooth-stemmed tropical American palms with large pinnate leaves sometimes used for thatch, mats, hats, etc., and with nut fruits enclosed in a fibrous husk. *A. funifera*, the piassaba palm of the coast provinces of southern Brazil, yields a cordage of great strength and durability in sea water. Its fruits (coquillanuts) are as large as ostrich eggs and are used like vegetable ivory (see **VEGETABLE IVORY**). The piassaba palm of northern Brazil is a different species. It furnishes a fibre which is exported. *A. excelsa* and *A. speciosa* furnish nuts which are burned in rubber-making to dry and color the rubber obtained from *Siphonia elastica*. *A. compta*, the pindóva or indajá palm, a handsome species with a wide-spreading crown, yields edible fruits as large as goose eggs. *A. Cohune*, indigenous to Honduras, supplies a fruit from which the oil is extracted for soap-making at home and abroad. Several species are cultivated in greenhouses, but are generally considered too slow of growth from seed to be satisfactory.

At'talus, the names of three kings of ancient Pergamus, 241-133 B.C., the last of whom bequeathed his kingdom to the Romans. All were munificent patrons of art and literature.

At'talus, Flavius Priscus, the emperor of the East for one year, 409-10. He was proclaimed by Alaric and his Goths, but soon deposed. Honorius later cut off his thumb and forefinger and banished him to the island of Lipari.

Attâr, ât-tar', Ferid eddin, celebrated Persian poet: b. near Nishapur, 1119; d. about 1229 (?). The son of a spicer, he followed his father's trade (whence his surname of Attâr), but afterward became a dervish and one of the greatest mystics of Persia. He is said to have been killed by a Mongol soldier during the invasion by Jenghiz Khan. Of his extant political works the most famous are: 'The Book of Council,' a series of didactic poems on ethics; 'The Parliament of Birds' (1184-7). His principal work in prose is 'Biographies of the Saints.'

At'tar, or Otto of Roses, a perfume extracted from rose petals. It is a volatile oil, of soft consistency, nearly colorless, and deposits a crystallizable substance partially soluble in alcohol. The best article is prepared at Ghazipoor in Hindustan; but is apt to be much adulterated with sandal wood and other oils. The whole country, for many miles around Ghazipoor, is a garden of roses, and in the spring of the year presents a most beautiful picture of red and green. The roses are used both for rose water and the oil of roses. The latter is obtained from the rose water by setting it out during the night in large open vessels, and early in the morning skimming off the essential oil, which floats at the top. The rose water after the removal of the oil is not so highly valued as before. It is estimated that 200,000 well-grown roses are required to produce half an ounce of the oil; and the value of this when it is manufactured is about \$40, and even

then it is likely to be adulterated. If warranted genuine, it sells for about \$50 or \$100 per ounce. Attar is also imported from Smyrna and Constantinople; but it rarely, if ever, arrives in this country pure. It is commonly adulterated with spermaceti and a volatile oil, which appears to be derived from one or more species of *Andropogon*, and which is called oil of ginger-grass, or oil of geranium. Pure attar of rose, carefully distilled, is at first colorless, but speedily becomes yellowish. It congeals below 80°; melts at 84°. At 57°, 1,000 alcohol dissolve 7½ oil, and at 72°, 33 oil. Specific gravity 872. Formula, C₂₁H₃₂O₂. Many attempts have been made to discover some chemical reaction which would reveal the falsification of attar with geranium oil, but hitherto mostly in vain.

Attempt', in criminal law an endeavor to accomplish a crime carried beyond mere preparation, but falling short of the execution of the ultimate design in any part of it. 5 Cush. Mass. 367. To constitute an attempt, there must be an intent to commit some act which would be indictable, if done, either from its own character or that of its natural and probable consequences. In some States an attempt to commit a crime is defined by statute. The statute in New York is substantially similar to that of other States. The Penal Code of New York, § 34, provides that "An act, done with intent to commit a crime, and tending but failing to effect its commission, is an attempt to commit that crime."

Attention. See **CONSCIOUSNESS**.

Atterbom, at'ter-bôm, Peter Daniel Amadeus, Swedish poet. b. Asbo, East Gothland, 19 Jan. 1790; d. Upsala, 21 July 1855. Having visited Germany and Italy in 1817-19, he formed ties of friendship with Schelling and Thorwaldsen; became instructor to Crown Prince Oscar, in 1820, and professor at the university in Upsala in 1828. He was unquestionably the foremost among the lyric poets of the romantic school in Sweden. His most celebrated work is 'The Isle of Blessedness' (1823), a romantic drama in the manner of Tieck; but he also wrote 'The Flowers,' a cycle of lyrics; 'The Blue Bird,' a play; and 'Swedish Seers and Poets,' a volume of criticism.

At'terbury, Francis, celebrated English prelate: b. Middleton Keynes, England, 6 March 1662; d. Paris, 15 Feb. 1732. He distinguished himself at the university as a classical scholar, and gave proofs of an elegant taste for poetry. In 1687 he took his degree of M.A.; is thought to have assisted his pupil, Boyle, in his famous controversy with Bentley on the Epistles of Phalaris. Taking orders in 1691 he settled in London, where he became chaplain to William and Mary, preacher of Bridewell, and lecturer of St. Bride's, and soon became distinguished by the spirit and elegance of his pulpit compositions, but not without incurring opposition, on the score of their tendency and doctrine, from Hoadly and others. Soon after the accession of Queen Anne he was made dean of Carlisle, and besides his dispute with Hoadly on the subject of passive obedience, he aided in the defense of the famous Sacheverell, and wrote 'A Representation of the Present State

of Religion,' deemed too violent to be presented to the queen, although privately circulated. In 1712 he was made dean of Christ Church, and in 1713 Bishop of Rochester and dean of Westminster. The death of the queen, in 1714, put an end to his hopes of further advancement; for the new king treated him with great coolness. Atterbury not only refused to sign the loyal declaration of the bishops in the rebellion of 1715, but suspended a clergyman for lending his church for the performance of divine service to the Dutch troops brought over to act against the rebels. Not content with a constitutional opposition, he entered into a correspondence with the Pretender's party, was apprehended in August 1722, and committed to the Tower; and in the March following a bill was brought into the House of Commons for the infliction of pains and penalties. This measure met with considerable opposition in the House of Lords, and was resisted by the bishop, who maintained his innocence with his usual acuteness and dexterity. His guilt, however, has been tolerably well proved by documents since published. He was deprived of his dignities, and outlawed, and went to Paris, where he chiefly occupied himself in study, and in correspondence with men of letters. But even here, in 1725, he was actively engaged in fomenting discontent in the Highlands of Scotland. As a composer of sermons he still retains a great portion of his original reputation. His letters, also, are extremely easy and elegant; but, as a critic and a controversialist, he is deemed rather dexterous and popular than accurate and profound.

Att'ic, pertaining to Attica or to Athens. Elegant; classical; poignant; characterized by keen intellect, delicate wit, sound judgment and expressive brevity; as, the Attic Muse. Attic dialect was the most refined and polished of all the dialects of ancient Greece; and in it wrote Solon, the lawgiver; Thucydides and Xenophon, the historians; Aristophanes, the comic poet; Plato and Aristotle, the philosophers, and Demosthenes, the orator. When, after the Macedonian conquest, Greek became the language of literature and diplomacy in most parts of the civilized world, the Attic came to be that dialect of the Greek tongue which was generally adopted.

Attic Order, in architecture, a low order, commonly used over a principal order, never with columns, but usually with antæ or small pilasters. It is employed to decorate the façade of a story of little height, terminating the upper part of a building; and it doubtless derives its name from its resemblance in proportional height and concealed roof to some of the buildings of Greece. In all the best examples, and especially in the remains of antiquity at Rome, the attic is decorated with a molded base and cornice; often with pilasters and figures, as in the Arch of Constantine. In modern architecture, the proportions of the attic order have never been subject to fixed rules, and their good effect is entirely dependent on the taste and feeling of the architect. **Attic base**: The base of a column consisting of an upper and lower torus, a scotia and fillets between them. **Attic story**: A term frequently applied to the upper story of a house, when the

ceiling is square with the sides, to distinguish it from a garret.

Att'ica, a State of ancient Greece, whose capital, Athens, was once the first city in the world. It is a peninsula, united, toward the north, with Bœotia, toward the west, in some degree, with Megaris, and extends far into the Ægean Sea at Cape Sunium (now Cape Colonna). The unfruitfulness of its soil protected it against foreign invaders, and the Athenians boasted of their ancient and unmingled race. The earliest inhabitants of Attica lived in a savage manner until the time of Cecrops, who came 1550 B.C. with a colony from Sais, at the mouth of the Nile, to Attica, and is acknowledged as their first real king. One of Cecrops' descendants founded 11 other cities, which in after-times made war upon each other. Theseus compelled these cities to unite, and to give to Cecropia, now called Athens, as the capital city of the whole country, the supreme power over the confederacy. He founded the great feast called the *panathenæa*, watched over the administration of the laws, commanded the army, divided the whole people into three classes—noblemen, husbandmen, and mechanics. He embellished and enlarged Athens, and invited foreigners to people the country. After the death of Codrus, 1068 B.C., the monarchical form of government, which had continued 487 years from the time of Cecrops, was abolished. An archon, chosen for life, possessed the regal power. After 316 years the term of office of the archons was limited to 10 years, and 70 years later to 1 year, and their number was increased to 9. A regular code of laws was now needed. The archon Draco was commissioned to draw one up; but his severity disgusted the minds of the people, and 594 B.C. Solon introduced a milder code and a better constitution. He provided that the form of government should continue democratic, and that a senate of 400 members, chosen from the people, should administer the government. Pisistratus, a man of talents, boldness, and ambition, put himself at the head of the poorer classes, and made himself master of the supreme power in Athens. His government was splendid and beneficent, but his two sons could not maintain it. Cleisthenes, a friend of the people, exerted himself to prevent future abuses by some changes in the laws of Solon. He divided the people into 10 classes, and made the senate consist of 500 persons. Attica was already highly cultivated; the vintage and harvest, like all the labors of this gay people, were celebrated with dance and song, with feasts and sacrifices. Then came the splendid era of the Persian war, which elevated Athens to the summit of fame. Miltiades at Marathon, and Themistocles at Salamis, conquered the Persians by land and by sea. The freedom of Greece escaped the dangers which had threatened it; the rights of the people were enlarged; the archons and other magistrates were chosen from all classes without distinction. The period from the Persian war to the time of Alexander (500 B.C. to 336) was most remarkable for the development of the Athenian constitution. According to Bockh's 'The Public Economy of Athens,' Attica contained, together with the islands of Salamis and Helena, a territory of 847 square miles, with 500,000 inhabitants,

ATTICA — ATTLA

365,000 of whom were slaves. Cimon and Pericles (444 B.C.) introduced the highest elegance into Athens, but the latter laid the foundation for the future corruption of manners, and for the gradual overthrow of the state. Under him began the Peloponnesian war, which ended with the conquest of Athens by the Lacedæmonians. A more dangerous enemy rose in the north—Philip of Macedon. Athens, together with the other states of Greece, became dependent on the Macedonians. When they suffered themselves to be misled to support Mithridates against the Romans, they drew upon themselves the vengeance of Rome. Sulla captured the city, and left it only an appearance of liberty, which it retained until the time of Vespasian. This emperor formally changed it into a Roman province. After the division of the Roman empire, Attica belonged to the empire of the East. 396 A.D., it was conquered by Alaric the Goth, and the country devastated. Attica, along with the ancient Bœotia, now forms a nome or province (Attike and Viotia) of the kingdom. See **ATHENS**.

Attica, Ind., city in Fountain County, on the Wabash River and Wabash Railroad; 21 miles southwest of Lafayette. It has numerous manufactories, churches, schools, two banks, and a public library. Pop. (1900) 3,005.

At'ticus, Titus Pomponius, a noble Roman, the intimate friend of Cicero: b. 109 B.C.; d. 32 B.C. The Pomponian family, from which he originated, was one of the most distinguished of the *equites*, and derived its origin from Numa Pompilius. When he attained maturity, the republic was disturbed by the factions of Cinna and Sulla. His brother, Sulpicius, the tribune of the people, being killed, he thought himself not safe in Rome, for which reason he removed, with his fortune, to Athens, where he devoted himself to science. His benefits to the city were so great, that he gained the affections of the people in the highest degree, and acquired so thorough a knowledge of Greek, that he could not be distinguished from a native Athenian. When Rome had recovered some degree of quiet, he returned and inherited from his uncle 10,000,000 of sesterces. His sister married the brother of Cicero. Cæsar treated him with the greatest regard, though he was known as a friend of Pompey. After the death of Cæsar, he lived in friendship with Brutus, without, however, offending Antony.

At'ticus Herod'es, Tiberius Claudius, a wealthy Athenian; b. about 104 A.D.; d. about 180. He received a careful education under the most distinguished masters of the time, and specially devoted himself to the study of oratory, to excel in which seems to have been the ruling motive of his life, ultimately attaining to great celebrity as a speaker and as a teacher of rhetoric. Among his pupils were Marcus Aurelius and Lucius Verus. He was highly esteemed by the Antonines, particularly by Aurelius, and received many marks of favor, among others the archonship at Athens and the consulate at Rome. Atticus is principally celebrated, however, for the vast sums he expended on public purposes. He withdrew from Athens, and resided at his villa near Marathon, where he died about 180 A.D. None of his writings are extant.

Attila, ät'ti-lä (in German, *Etzel*), the son of Mundzuk, a Hun of royal descent, who followed his uncle, Roas, in 434, and shared the supreme authority with his brother, Bleda. These two leaders of the barbarians, who had settled in Scythia and Hungary, threatened the Eastern Empire, and twice compelled Theodosius II. to purchase an inglorious peace. The Huns themselves esteemed Attila, their bravest warrior and most skilful general. Their regard for his person soon amounted to superstitious reverence, and being now sole master of a warlike people, his unbounded ambition made him the terror of all nations; and he became, as he called himself, the *scourge* which God had chosen to chastise the human race. In a short time he extended his dominion over all the people of Germany and Scythia, and the eastern and western emperors paid him tribute. The Vandals, the Ostrogoths, the Gepidæ, and a part of the Franks united under his banners. Hearing a rumor of the riches and power of Persia, he directed his march thither, but was defeated on the plains of Armenia, and drew back to satisfy his desire of plunder in the dominions of the emperor of the East. He easily found a pretext for war, for all states which promised him a rich booty were his natural enemies, and all princes whom he hoped to conquer had broken alliances. The Emperor Theodosius collected an army to oppose his progress; but in three bloody battles fortune declared herself for the barbarians. Constantinople was indebted to the strength of its walls, and to the ignorance of the enemy in the art of besieging, for its preservation. Thrace, Macedonia, and Greece, all submitted to the savage robber, who destroyed 70 flourishing cities. Theodosius was at the mercy of the victor, and was obliged to purchase a peace. Attila now directed his eyes to Gaul. With an immense army he passed the Rhine, the Moselle, and the Seine, came to the Loire, and sat down under the walls of Orleans. The inhabitants of this city, encouraged by their Bishop, Agnan (Anianus), repelled the first attack of the barbarians, and the united forces of the Romans, under their general, Aetius, and of the Visigoths, under their king, Theodoric, compelled Attila to raise the siege. He retreated to Champagne, and waited for the enemy in the plains of Chalons. The two armies soon approached each other. Attila, anxious for the event of the battle, consulted the soothsayers, who assured him of a defeat. He concealed his alarm, rode through the ranks of his warriors, reminded them of their deeds, spoke of his joy at the prospect of a battle, and at the thought that their valor was to be rewarded. Inflamed by his speech, and by the presence of their leader, the Huns were impatient for battle. At length the ranks of the Romans and Goths were broken through, and Attila was already sure of the victory, when the Gothic prince, Thorismond, the son of Theodoric, poured down from the neighboring height upon the Huns. Attila, pressed on all sides, escaped with difficulty to his camp. This was perhaps the bloodiest battle which has ever been fought in Europe; for, according to contemporary historians, 106,000 dead bodies covered the field of battle. Attila caused all his camp equipage and treasures to be brought together into a heap, in

ATTITUDE—ATTORNEY-GENERAL

order to burn himself with them, in case he should be reduced to extremities. But the enemy were contented with collecting their forces during the night, and having paid the last honors to the dead body of King Theodoric (Dietrich), which they discovered with difficulty, they saluted his son, Thorismond, king upon the field of battle. Thus Attila escaped, but the Franks pursued him till he had passed the Rhine. He now demanded Honoria, the sister of Valentinian III., in marriage, and conquered and destroyed Aquileia, Padua, Vicenza, Verona, Bergamo, and laid waste the plains of Lombardy. The inhabitants fled to the Alps, to the Apennines, and to the small islands in the shallows (lagoons) of the Adriatic Sea, where they built Venice. The emperor had no army to oppose him; the Roman people and senate had recourse to tears and supplications. Pope Leo I. went with the Roman ambassadors to the enemy's camp and succeeded in obtaining a peace. Attila went back to Hungary. The Romans looked upon their preservation as a miracle, and the old chronicles relate that the threats of St. Peter and St. Paul had terrified Attila—a legend which the art of Raphael and Alghardi has immortalized. Not having obtained Honoria for a wife, Attila would a second time have demanded her, sword in hand, if the beautiful Ildico had not been added to his numerous wives, with whom he solemnly united himself (453). This circumstance hindered him from fulfilling his threats. On this occasion he gave himself up to all the extravagance of debauchery; but on the other day after the marriage, the servants and warriors impatient to salute their master, thronged into the tent: they found Ildico veiled, sitting by the cold corpse of her husband. During the night he had died of a hemorrhage. The news of his death spread sorrow and terror in the army. His body was enclosed in three coffins—the first was of gold, the second of silver, and the third of iron. The captives who had made the grave were strangled. The description that Jornandes has left us of this barbarian king reminds us of his Kalmuck-Tartar origin. He had a large head, a flat nose, broad shoulders, and a short and ill-formed body. See Thierry, 'Histoire d'Attila' (1814).

Attitude, an art term signifying an artistic pose or position assumed by living figures. Attitudes require a regular study, a part of which is a knowledge of anatomy. The art of exhibiting attitudes, at least in modern times, is of recent invention. At the end of the 18th century the celebrated Lady Hamilton began the practice, and imitated, with great talent, the attitudes of antique statues in many large towns of Europe, so that Sir William Hamilton could say that he possessed, in his wife, a whole collection of antiques. Her dress was a simple tunic, fastened with a ribbon tight under the breast, and a shawl. With these she imitated all the different draperies. On the continent of Europe this art was carried to much perfection by Mrs. Hendel Schutz, who exhibited attitudes, copied from the Greek, Egyptian, Italian, and German styles of art.

Attleboro, Mass., a town of Bristol County, 30 miles southeast of Boston, and 12 miles from Providence. It has good railroad connections, contains national banks, newspaper

offices, several churches, and a system of graded schools. The town is the seat of several important industries, the chief of which is the manufacture of jewelry and electro-plate. There are also manufactories of cotton, woolen, and knit goods, and of boots and shoes. Pop. (1900) 11,335. Consult Daggett, 'A Sketch of the Town of Attleborough' (1894).

Attock, āt-tōk', a town and fort of the Punjab, on the east bank of the Indus. Attock stands below the fort, established by the Emperor Akbar in 1581, to defend the passage of the river. The great railway bridge across the Indus here was opened in 1883. It has five arches 130 feet high, and renders continuous the railway connection between Calcutta and Peshawur (1,600 miles). The situation of Attock is important, whether in a commercial or in a military view. It is at the head of the steamboat navigation of the Indus, being 940 miles from its mouth. Taxila, where the Macedonians crossed the Indus, has been identified with Attock.

Attorney, āt-tūr'nī (*attornatus*, in Latin), a person appointed to do something for and in the stead and name of another. A public attorney or attorney at law is a person qualified to appear for another before a court of law to prosecute or defend any action on behalf of his client. The term was formerly applied especially to those practising before the supreme courts of common law at Westminster, and corresponded to the term solicitor used in regard to the courts of chancery. As an attorney was almost invariably a solicitor, the two terms came to be generally regarded as synonymous. By the Judicature Act of 1873 all persons practising before the supreme courts at Westminster are now called solicitors. Attorneys or solicitors do not plead or argue in court on behalf of their clients, this being the part of the barristers or counsel; their special functions may be defined to be, to institute actions on behalf of their clients and take necessary steps for defending them, to furnish counsel with necessary materials to enable them to get up their pleadings, to practice conveyancing, to prepare legal deeds and instruments of all kinds, and generally to advise with and act for their clients in all matters connected with law. An attorney, whether private or public, may have general powers to act for another; or his power may be special, and limited to a particular act or acts. In Scotland there is no class of practitioners of the law who take the name of attorneys. A special attorney is appointed by a deed called a power or letter of attorney, and the deed by which he is appointed specifies the acts he is authorized to perform. It is a commission, to the extent of which only he can bind his principal. As far as the acts of the attorney, in the name of the principal, are authorized by his power, his acts are those of his principal. But if he goes beyond his authority, his acts will bind himself only; and he must indemnify any one to whom, without authority, he represents himself as an attorney of another, and who contracts with him, or otherwise puts confidence in him, as being such attorney.

Attorney-General, in English law, an important officer under the king, made by letters patent. His most important duties are to

ATTORNEY AT LAW—ATWATER

exhibit informations and prosecute for the crown in matters criminal, and to file bills in the exchequer in any matter concerning the king's revenue. The attorney-general of the United States is an officer appointed by the President. He is required by statute to give his advice and opinion upon questions of law whenever required by the president; to pass upon the validity of the title to public lands purchased for the erection of public buildings by the United States; when requested, to give his opinion to the head of any executive department on any questions of law arising in his department; to conduct and argue all cases in which the United States is interested, whenever he deems it best for the interests of the United States for him to do so; to exercise general superintendence and direction over the attorneys and marshals of all the districts in the United States and the Territories as to the manner of discharging their respective duties. The attorney-general is also a member of the Cabinet, and according to the provisions of the act of Congress of 19 Jan. 1886, is the fourth in succession, after the Vice-President, to the office of President in case of a vacancy in that office. In each of the United States there is an attorney-general, or similar officer, who appears for the people, as in England he appears for the Crown. Only a few of the duties of the attorney-generals in the various States are defined by statute, consequently, so far as applicable to our altered situation, jurisprudence, and system of government, attorney-generals of the various states are clothed with the common law powers of the attorney-generals of England. The attorney-general of England had the power (1) to prosecute all actions necessary for the protection and defense of the property and revenues of the Crown; (2) by information to bring certain classes of persons accused of crimes and misdemeanors to trial; (3) by "*scire facias*" to revoke and annul grants made by the Crown improperly, or when forfeited by the grantee thereof; (4) by information, to recover money or other chattels or damages for wrongs committed on the land, or other possessions of the Crown; (5) by writ of *quo warranto*, to determine the right of him who claims or usurps any office, franchise, or liberty, and to vacate the charter, or annul the existence of a corporation for violations of its charter, or for omitting to exercise its corporate powers; (6) by writ of mandamus to compel the admission of an officer duly chosen to his office, and to compel his restoration when illegally ousted; (7) by information to chancery, to enforce trusts, and to prevent public nuisances, and the abuse of trust powers; (8) by proceedings *in rem*, to recover property to which the Crown may be entitled, by forfeiture for treason, and property for which there is no other legal owner, such as wrecks, treasure trove, etc.; (9) and in certain cases, by information in chancery, for the protection of the rights of lunatics, and others who are under the protection of the Crown.

Attorney at Law, an officer of a court of justice employed by a party in a cause to manage it for him. Appearance by attorney has been allowed in England from the time of the earliest records of the courts of that country. Such appearances were first allowed in France by letters patent of Philip le Bel, 1290 A.D. No

one can, by consent, be the attorney of both the litigating parties in the same section or suit. The agreement of an attorney at law, within the scope of his employment, in general, binds his client (1 Salk. 86) as to amend the record, to refer a cause, not to sue out a writ of error, to strike out a *non pros*, to waive a judgment by default, etc. The principal duties of an attorney are to be true to the court and to his client, to attend to the business of his client with prudence, skill, and honesty (4 Burr. 2061, 72 Ga. 83); to keep his client informed as to the state of his business, and to keep his secrets confided to him as such, and an attorney is privileged from disclosing such secrets when called as a witness (16 N. Y. 180, 29 Vt. 701). An attorney is allowed considerable freedom of speech, and ordinarily, is not liable for the use of false, defamatory, or malicious language, provided it was material to the issues raised by the pleadings (Hastings v. Lusk, 22 Wend. N. Y. 410). He is liable, however, if his language is defamatory, if it can be shown that it was not relevant to the issues, and was used for the purpose of injuring the character of his adversary (1 Barn. & C. 258).

Attrac'tion, in physics, any force acting between two bodies, which tends to bring them nearer together, or to oppose their further separation. All attractions can be divided into two classes: (1) Those which act at sensible distances, such as gravity and magnetism, and (2) those which exert measureable effects only when the bodies are exceedingly close together. Cohesion and molecular forces are examples of the second class. See COHESION; ELECTRICITY; ETHER; GRAVITATION; MAGNETISM; MOLECULAR THEORY; SURFACE TENSION.

At'tribute, in philosophy, a quality or property of a substance, such as whiteness or hardness. A substance is known to us only as a congeries of attributes. In the fine arts an attribute is a symbol regularly accompanying and characterizing some personage. Thus the caduceus, purse, winged hat, and sandals are attributes of Mercury, the trampled dragon an attribute of St. George.

At'tucks, Crispus, a mulatto or half-breed Indian: b. about 1720. He was a leader of the mob, who, on 5 March 1770, provoked the English soldiers in Boston to open fire, which resulted in the death of Attucks and others and created the incident known as the "Boston Massacre." The English officer of the day and six of his men were tried for murder and acquitted by a jury.

At'water, Lyman Hotchkiss, American theologian: b. Hampden, Ct., 23 Feb. 1813; d. Princeton, N. J., 17 Feb. 1883. He was pastor of the First Congregational Church in Fairfield, Ct., in 1835-54; in the last named year becoming professor of mental and moral philosophy at Princeton College, and, in 1869, professor of logic, metaphysics, political science, economics and ethics there. He was the author of a 'Manual of Elementary Logic' (1867).

At'water, Wilber Olin, American chemist: b. Johnsburg, N. Y., 3 May 1844. He was graduated at Wesleyan University in 1865; made a special study of chemistry in the Sheffield Scientific School of Yale and the universities of Leipsic and Berlin. He has been

successively professor of chemistry in East Tennessee University, Maine State College, and Wesleyan University. He was director of the Connecticut Agricultural Experiment Station, 1875-7, and was appointed director of the Storrs (Conn.) Experiment Station in 1887. He has been connected for several years with the United States Department of Agriculture; has published a large number of papers on chemical and allied subjects; and since 1894, has given much attention to nutrition investigations.

Atwill, Edward Robert, American bishop: b. Red Hook, N. Y., 18 Jan 1840. He was graduated from Columbus University in 1862, and General Theological Seminary, 1864. He was rector of St. Paul's Church, Burlington, Vt., 1867-80; of Trinity Parish, Toledo, O., 1881-90; and was consecrated first Protestant Episcopal bishop of West Missouri, 14 Oct. 1890.

Atwood, Charles B., American architect: b. Millbury, Mass., 18 May 1849; d. Chicago, 19 Dec. 1895. He studied at the Harvard Scientific School, and opened an office in 1872. Within three years he received prizes for designs for the San Francisco city hall, the Connecticut State capitol, the court house in Springfield, Mass., and a commission to build the Holyoke, Mass., city hall. Removing to New York in 1875, he designed residences for W. H. Vanderbilt, Eliot F. Shepard, and W. D. Sloane, and interior decorations for the houses of Mrs. Mark Hopkins in San Francisco and Gt. Barrington, Mass. In 1884 he gained the first prize for a design for the Boston Public Library, and later a prize of \$5,000 for plans for a new city hall in New York city. From 1891-3 he was associated with D. H. Burnham in planning the World's Fair buildings in Chicago. The art building, peristyle, service building, and many minor features were from his designs. He was a close student of his art, and a marvelous draughtsman, using his left hand with sureness and rapidity. D. H. Burnham said of him, "He was of an honorable, charitable disposition, but like most great artists, a mere child in the practical things of life."

Atwood, George, an eminent English mathematician: b. London 1746; d. 11 July 1807. In 1874 he published 'Treatise on the Rectilinear Motion and Rotation of Bodies; with a Description of Original Experiments relative to that Subject'—a work remarkable for its perspicuity and the extensive information which it affords. About the same time he made public an 'Analysis of a Course of Lectures on the Principles of Natural Philosophy,' read at the University of Cambridge, which is not less valuable than the preceding. He published a 'Dissertation on the Construction and Properties of Arches' (1801), and several other valuable treatises relating to mathematics and mechanical science. He invented a machine still used in physical lecture-rooms, which affords great facilities for verifying the laws of falling bodies. See **ATWOOD'S MACHINE**.

Atwood, Isaac Morgan, American educator: b. Pembroke, N. Y., 24 March 1838. He was ordained in the Universalist Church in 1861; held several pastorates; edited *The*

Christian Leader (1867-73); became an associate editor of the *Universalist Leader*; and was chosen president of the Canton (N. Y.) Theological Seminary in 1879. His chief works are: 'Have We Outgrown Christianity?' (1870); 'Latest Word of Universalism' (1878); 'Manual of Revelation' (1888); 'Walks About Zion' (1881).

Atwood, Melville, Anglo-American geologist: b. 31 July 1812, Prescott Hall, England; d. Berkeley, Cal., 25 April 1898. He studied lithology, microscopy, and geology early in life, and engaged in gold and diamond mining in Brazil. In 1843 he made a discovery that greatly enhanced the value of zinc ore. After coming to the United States, in 1852, he invented the blanket system of amalgamation. He also established the value of the famous Comstock silver lode, by an assay of minerals in that region.

Atwood's Machine, an instrument devised by George Atwood, an English physicist, for illustrating the principles governing the motion of falling bodies, and described by him in a book published in 1784. It consists essentially of a light wheel or pulley, over which a thin, flexible cord passes. A mass of matter is attached to each end of the cord, and the experiment consists in observing the velocity acquired by the system at the end of a given time. The mass to be removed is evidently the sum of the two masses attached to the ends of the cord (assuming that the wheel is light enough to be disregarded); and the force tending to set the system in motion is the difference of the weights of the two masses. By making these masses nearly equal, the motion can be made slow enough to be conveniently studied. The intensity of gravity can be determined by the aid of this machine, with sufficient accuracy for class-room purposes, and it is an admirable device for illustrating the laws of uniformly accelerated motion. For a more detailed account see **GRAVITY**.

Atys, ä'tis, or Attys. (1) The favorite of Cybele, who, having broken the vow of chastity which he made to the goddess, castrated himself, as a punishment for his crime. (2) A son of Cræsus, king of Lydia—an affecting example of filial love. He was dumb, but, seeing a soldier in a battle who had raised a sword against his father, he exerted himself so much that the bands of his tongue gave way, and he cried out, "Soldier, kill not Cræsus!"

Aubanel, ô-bä-nél', The'odore, French poet, sometimes called "The Petrarch of France": b. 1829; d. 1886. He devoted his life to the restoration of the troubadour literature. His drama, 'Lou Pan don Pecat,' was successfully staged in 1878 at Montpellier.

Aube, ôb, a French department, formed out of the south of Champagne and a small portion of Burgundy; area, 2,351 square miles. The north and northwest districts are very bleak, bare of trees, and almost destitute of vegetation; the southern districts are remarkably fertile. The forests, which are extensive, furnish much fuel for the supply of Paris. The chief manufactures are worsted and hosiery. Troyes is the capital.

AUBE—AUBURN

Aube (ancient *Alba*), a French river which is tributary to the Seine, after a course of 113 miles. It is navigable to Arcis, a distance of about 20 miles.

Auber, ô-bâr', Daniel François Esprit, celebrated French operatic composer: b. Caen, 29 Jan. 1782; d. Paris, 13 May 1871. From natural inclination he devoted himself to the study of music, in which he had the assistance of Cherubini. His first decided success was his opera '*La Neige*,' produced in 1824. By this time he had associated himself with Scribe, a very skilful writer of *libretti*; and other operas now followed in quick succession, for which the words were supplied by Scribe, and the music by Auber. Some of these are still favorites, for example, '*Le Domino Noir*,' '*Les Diamants de la Couronne*' (Crown Diamonds), and above all, '*Fra Diavolo*,' and '*La Muette de Portici*' (usually known as '*Masaniello*'), in which last work he distinguished himself as a composer of serious opera, and attained a height which not one of his other works ever approached. His peculiar field, however, was the comic opera, in which by his charming melodies, bearing strongly the stamp of the French national character, as well as by his other excellences, he acquired general popularity. Consult Ferris, '*Great Musical Composers*' (1887).

Auberge, Rouge L', lô'bärzh' roozh, the title of a psychical romance by Balzac (1837).

Auberlen, ow'bér-lén, Karl August, German Protestant theologian: b. Fellbach, Württemberg, 19 Nov. 1824; d. Basel, 2 May 1864. He was educated at Tübingen, and made professor at Basel in 1851. He was author of '*The Divine Revelation: an Essay in Defense of the Truth*.'

Aubertin, ô'bër-tän', Charles, French scholar: b. St. Didier, 24 Dec 1825. He became rector of the Academy of Poitiers in 1874. His works include '*Critical Study of the Alleged Relations of Seneca to St. Paul*' (1857); '*Public Spirit in the Eighteenth Century*' (1873); '*Origins of French Language and Literature in the Middle Ages*' (1876-8), etc.

Aubigné, D', J. H. M. See D'AUBIGNÉ, J. H. M.

Aubigné, ô'be-nyä', Theodore Agrippa d', French soldier and author: b. Saint Maury (Saintonge), 8 Feb. 1552; d. Geneva, 29 April 1630. He fought under Henry IV., king of France, who made him a gentleman of his bed-chamber; but when the king, thinking it necessary, favored the Roman Catholics more than the Protestants, Aubigné expressed his displeasure with little reserve, and lost the favor of Henry. He now retired to Geneva, where he devoted himself to literary pursuits. He wrote a valuable '*Histoire Universelle*, from 1550 to 1601' (3 vols. folio), the first volume of which was ordered to be burned by the Parliament of Paris. A volume of sonnets and other poems, under the title '*Le Printemps*,' also bears his name.

Aublet, ô-blä', Albert, French painter: b. Paris. He studied historical painting under Gerome; won a first-class medal in the Paris Exposition of 1889, and the decoration of the Legion of Honor in 1890. His first great painting was the '*The Wash-room of the Reserves*

in the Cherbourg Barracks,' exhibited in the Salon of 1879, and probably his most celebrated one is the '*Meeting of Henri III. and the Duc de Guise*,' shown in the Salon of 1880.

Aubrey, â'bri, John, English antiquary: b. Easton Pierse, 1626; d. 1697. He published little, but left large collections of manuscripts, which have been used by subsequent writers. He collected materials for the '*Monasticon Anglicanum*, and afforded important assistance to Wood, the Oxford antiquary. His '*Miscellanies*' (1696) contains a great deal of curious and interesting information, but also displays much credulity and superstition. Another work of his was published in 1719 under the title of the '*Natural History and Antiquities of the County of Surrey*' In 1898 appeared a work by him entitled '*Brief Lives Chiefly of Contemporaries*,' edited by Andrew Clark.

Auburn, Ala., a town of Lee County, situated on the Western R.R. of Alabama, 60 miles north of Montgomery. It is the seat of the Alabama Polytechnic Institute, established in 1872. Pop. (1900) 1,447.

Auburn, Cal., a city and county-seat of Placer County, situated on the Southern P. R.R., 36 miles east of Sacramento. It was first settled in 1849 and was incorporated as a city in 1888. It is the seat of the Sierra Normal College. Gold and quartz is found in the vicinity and there are many quartz mills. The leading industries are mining, fruit-growing, and farming. Pop. (1900) 2,050.

Auburn, Ind., city and county-seat of De Kalb County, situated on branches of the Lake Shore & M. S., and the Baltimore & O. R.R.'s, 22 miles north of Fort Wayne. It has a thriving trade in grain, live stock, etc., and its chief manufactures are furniture, carriages, automobiles, gas engines, windmills, and stoves. Auburn was first settled in 1833, became a borough in 1836 and a city in 1900. The mayor and other officials are elected biennially. Pop. (1900) 3,396.

Auburn, Me., a city and county-seat of Androscoggin County, on the west bank of the Androscoggin River, and on the Maine C. and Grand Trunk R.R.'s, 33 miles north of Portland. It is finely situated both for beauty of scenery and for industrial advantages. The river, which here has a fall of about 60 feet, separates Auburn from Lewiston (q.v.), and the two cities are closely united in business and social interests. The extensive water-power at this point makes the site most favorable for manufacturing purposes.

Industries and Banks—The leading industries of Auburn are the manufacture of boots and shoes and cotton goods, and various forms of woodworking. In the boot and shoe industry it has long been prominent, and in this branch of manufacture is the foremost city of Maine, having seven factories and shops employing about 2,000 persons. The employees of the cotton factory number about 500, and those of the two woodworking shops 100. The city has three banks.

Churches and Schools.—The religious denominations having churches in Auburn are the Baptist, Congregationalist, Episcopalian, Free Baptist, Methodist, and Universalist. At the head of the public school system stands the Edward Little High School.

AUBURN—AUCKLAND

History and Government.—Auburn was first settled in 1786, and was originally a part of Minot, from which it was set off as a separate town in 1842. Its city charter was received in 1869. The population, of whom about one fifth are French Canadians, the rest being chiefly natives, was 12,951 in 1900, and in 1903 was estimated at 13,461.

GEORGE F. HUFF,
Editor of 'Auburn Advocate.'

Auburn, Neb., a city and county-seat of Nemaha County, situated on the Missouri P. and the Burlington & M. R. R.R.'s, 65 miles south of Omaha. It was first settled in 1861, became a borough in 1884 and a city in 1890. There are large fruit packing and canning plants and a flour mill here. Pop (1900) 2,664.

Auburn, N. Y., city, county-seat of Cayuga County; on Owasco River, the outlet of Owasco Lake, and on the New York Central and Lehigh Valley R.R.'s, 26 miles southwest of Syracuse. It was first settled in 1793 by Colonel John Hardenburgh, and was called Hardenburgh's Corners; in 1805 the name was changed to Auburn, and it was selected as the county-seat; in 1815 it was incorporated as a village, and in 1848 became a city. It is the seat of a session of the Federal Court. Auburn was the home of William H. Seward, of Gen John S. Clark, (Gen. Clark still lives here), the Indian archaeologist, and of Theodore Cuyler. It is situated on hills commanding an extensive view to the northeast; the head of Owasco Lake is only a few miles from the city limits to the south; and the course of the outlet of the lake is very picturesque until reaching the manufacturing district. This outlet furnishes excellent water power for the numerous industries which have made Auburn prosperous. The largest establishment is a manufactory of agricultural implements which exports its goods to every part of the world; other industries of almost equal importance are tool, carpet, and shoe factories, woolen mills, cordage factories, and breweries. The city has a progressive board of trade, and six banks, two of which are national banks having a combined capital of \$400,000. Auburn contains a number of fine public and private buildings, including a general hospital, costing \$100,000, a municipal hospital for contagious diseases, the court-house, the United States government building, the Case Memorial Library, and the Burtis Auditorium (erected 1904-5). There are 14 public grammar schools, the public high school, and 4 Roman Catholic parish schools. Auburn is also the seat of the Auburn Theological Seminary (Presbyterian), which, with its four buildings, Welch Memorial, and Dodge Library, Morgan Hall and Willard Memorial Chapels, forms another interesting feature of the city. In 1883 the 400th anniversary of Luther's birthday was celebrated at the Seminary by the planting at Morgan Hall of a sprig of ivy from Wartburg Castle, Luther's prison home. The city government is vested in a mayor, elected every two years, and a board of aldermen of 10 members; the mayor has the power of appointing the heads of the city departments. The municipality owns and operates the water-works. Pop. (1890) 25,858; (1900) 30,345.

CLINTON S. MARSH,

Superintendent of Schools, Board of Education.

Auburn, â'bûrn, the name of Goldsmith's 'Deserted Village,' generally supposed to be

Lissoy in Westmeath, Ireland, where the poet's boyhood was spent.

Auburn Theological Seminary, a Presbyterian institution in Auburn, N. Y.; organized in 1820. At the close of 1899 it had 9 professors and instructors, 91 students, 30,000 volumes in the library, grounds and buildings valued at \$300,000; aggregate endowment funds, \$626,417; income, \$66,736. Its graduates then numbered 1,500.

Aubusson, ô'bu-sôn', Pierre d', grand-master of the Knights of St. John of Jerusalem: b. 1423; d. Rhodes, 1503. He was descended from the old counts of LaManche in France, served, it is said, in early life in the wars against the Turks; some time after entered the order of St. John. He first obtained a commandery, next was made grand-prior, and in 1476, on the death of Grand-master Orsini, succeeded him. In 1480 the island of Rhodes, the headquarters of the order, was invaded by a Turkish army of 100,000 men. The town was besieged for 89 days and then assaulted, but the valor of D'Aubusson and his knights proved victorious, and the Turks were obliged to retire, leaving 9,000 dead and carrying off 15,000 wounded.

Auchmuty, ôk'mû-tî, Richard Tylden, American philanthropist: b. New York city, 1831; d. Lenox, Mass., 18 July 1893. He received a collegiate education; practised architecture for many years with James Renwick; served in the Union army through the Civil War; declined several public offices after its close, and with his wife founded the New York Trade Schools on an original plan, which soon became productive of large results, at a cost of \$250,000.

Auchmuty, Samuel, American clergyman: b. Boston, 16 Jan. 1722; d. New York city, 6 March 1777. He was admitted to the diaconate by the bishop of London, 1747, and entered the service of the Society for the Propagation of the Gospel, receiving an appointment as catechist to the negroes in Trinity Parish, New York. He became rector of Trinity in 1764, and during the Revolutionary War he remained a loyalist, continuing to read prayers for the king until compelled to desist and withdraw to New Jersey. When Gen. Howe took possession of the city Auchmuty passed the American lines with difficulty only to find his church in ruins and its records destroyed. The exposure he underwent in evading the Americans affected his health and led to his death.

Auckland, âk'lând, William Eden, LORD, English statesman and diplomatist: b. 1774; d. 1814. He had great influence in Pitt's ministry, and was employed in important embassies. Afterward, as a member of Parliament, he had a great influence in the reform of the penal laws, and, with Howard and Blackstone, in the organization of a new system of police, and a better mode of treating prisoners. He subsequently held the important post of secretary of state for Ireland, and in 1785 was ambassador extraordinary to the French court to negotiate a commercial treaty, which was concluded in 1786. During the first year of the French Revolution he was ambassador extraordinary to the states-general of the Netherlands; and in this capacity had great influence on the measures which the course of events was constantly rendering more complicated.

AUCKLAND — AUDETTE

Auck'land, a province of New Zealand, forming the northern part of North Island, and with an area of 25,746 square miles. Auckland, a city and capital of the province, and formerly capital of New Zealand, is situated on the northeast coast of North Island. It has two excellent harbors, one at Waitemata and one at Manukan on the opposite side of the isthmus. The former is one of the finest in New Zealand. There are numerous wharves and two graving docks, one of which, the Calliope dock, opened in 1887, is one of the largest in the South Seas. Connected with the chief towns of the island by rail the city has a large and increasing trade. The site is fine, and there are numerous handsome public buildings, including churches, fine schools, and the Auckland Institute. Chief manufacturing interests are ship-building yards, boiler works, glass works, shoe factories, etc. There is a United States consulate here. Pop. (1901) 34,216.

Auck'land Islands, a group of islands in the Pacific Ocean to the south of New Zealand. The largest island is about 30 miles long by 15 broad, and is covered with dense vegetation. They belong to the English government, almost entirely uninhabited, and serve as a station for whaling ships.

Auction and Auctioneer. An auction is a public sale of property to the highest bidder. It is not material how the sale is conducted, whether by public outcry or other manner. The essential part is the selection of a purchaser from a number of bidders. Catalogues describing the property are usually printed, the terms of the sale are also usually stated in the catalogue. Auctions are generally conducted by persons licensed for that purpose. Bidders may be employed by the owner of the property, if it be done *bona fide* and to prevent a sacrifice of the property under a given price, but where the bidding is fictitious and by combination with the owner to mislead the judgment or inflame the zeal of others it would be a fraudulent and void sale. Unfair conduct on the part of the purchaser will avoid the sale. Misdescription of property sold will avoid the sale if it is material. An auctioneer cannot bid for himself; he cannot deny his principal's title; he cannot sell at private sale; he has ordinarily the power to collect the purchase price of goods sold from the buyer. The auctioneer must use ordinary care and skill in the discharge of his duties, and like other agents he must obey the instructions he receives from the owner of property sent him for sale. An auctioneer, according to the weight of authority, who sells stolen property is liable to the owner, notwithstanding that the goods were sold by him, and the proceeds paid over to the thief without notice of the felony. An auctioneer is also liable for want of care of the goods while in his possession. The auctioneer has a lien upon the goods for the charges of the sale, and for his commission. He is the agent of the seller, and for same purposes, of the buyer.

Aucuba, â'kü-bä, a genus containing three species, of which *A. japonica* is the best known. They belong to the natural order *Cornaceæ*. The species mentioned is a dioecious evergreen laurel-like shrub of many varieties, native of China and Japan, largely planted on lawns and in shrubberies. It withstands the dust, smoke,

and gases of cities remarkably well, but is not hardy in the Northern States. The plants bear purple flowers in summer and the female ones are particularly beautiful when bearing their scarlet berries which ripen in early spring. It is easily propagated by seed, or by green wood cuttings, and succeeds in half shade where the soil is good, friable, moist, but well-drained.

Audæ'us (Syrian Udo), the founder of a religious sect called Audians, which held anthropomorphic views, and was established under the following circumstances. Audius (b at the end of 3d century; d 370), was a Mesopotamian, of singular purity and severity of character. He became disgusted with the Syrian clergy, and on expressing his opinion with more firmness than discretion, was excommunicated; when a considerable number of sympathizers gathered around him and constituted themselves into a church. But this sect could not long withstand the persecutions to which it was exposed, and died almost at the same time as its founder, who passed the latter part of his life in exile in Scythia, where he converted many pagans to Christianity by the force of his teachings, and the moral beauty of his ascetic life.

Aude, ôd, a maritime department in the south of France; area, 2,433 square miles. It is mainly covered by hills belonging to the Pyrenees or the Cevennes, and is traversed by a valley drained by the Aude. The loftier districts are bleak and unproductive; the others tolerably fertile, yielding good crops of grain. Its capital is Carcassonne. Pop. (1901) 311,386.

Aude, a river of France, which rises in the East Pyrenees, in the Department of Pyrénées Orientales, and after a course of nearly 130 miles, falls into the Mediterranean. It receives several affluents, of which the principal is the Orbieu.

Audebert, ôd-bär', Jean Baptiste, French naturalist and engraver. b. Rochefort, 1759; d. 1800. He went, at the age of 18, to Paris to learn drawing and painting, and made himself a skilful miniature painter. This occupation having awakened in him a taste for natural history, he undertook some works which laid the foundation of his fame. The first was 'Histoire Naturelle des Singes, des Makis, et des Galéopithèques' (1800), in which he shows himself an able draughtsman, engraver, and writer. Not satisfied with laying different colors on the same plate, so as to produce a kind of painting, he went farther, and, instead of water colors, used the more durable oil colors. He carried his art to still greater perfection by using gold in his impressions, the color of which he changed in different ways, in order to imitate the splendor of his patterns. Natural history was greatly benefited by his work, the splendor of which was astonishing. His 'Histoire des Colibris, des Oiseaux-Mouches, des Jacamars, et des Promerops' (1802), is esteemed the most complete work that has appeared in this department. Fifteen copies were struck off with golden letters.

Audette, â-dët', Louis Arthur, Canadian lawyer: b. Quebec, 14 Dec. 1856. He was educated at Quebec Seminary and Laval University; called to the bar in 1880; was secretary to the board of arbitrations appointed in 1893 to deter-

mine disputed matters of account between Canada and the provinces of Ontario and Quebec; and also became registrar of the exchequer court of Canada. He published 'The Practice of the Exchequer Court of Canada' (1895).

Audiffret-Pasquier, ô'dê-frâ'pas-kyâ', **Edme Armand Gaston, Duc d'**, French statesman: b. Paris, 1823. He was president of the National Assembly in 1875 and was the first life-senator appointed by that body. In 1878 he was chosen to the French Academy.

Au'diom'eter, for the measurement of hearing, an instrument devised by Prof. Hughes, the English inventor of the microphone. Among its constituent parts are an induction coil, a microphone key and a telephone. The audiometer has been materially modified, and is now principally used for obtaining a balance of induction from two electric coils acting upon a third. A scale is provided to show the extent of the movement. A varying or interrupted current being passed through the two outer coils, the preponderating current will produce the most induction if the central coil is equidistant. It can always be moved to such a point that there will be no inductive effect, one counteracting the other. Thus its position measures the relative induction. A telephone is in circuit with the intermediate coil and is used to determine when its position is such that no current is induced in it.

Au'diphone, an invention to assist the hearing of partially deaf persons in whom the auditory nerve is not entirely destroyed. The instrument, made of a thin sheet of ebonite rubber or hard vulcanite, is about the size of a palm leaf fan, with a handle and strings attached to bend it into a curving form, and a small clamp for fixing the string at the handles. The audiphone is pressed by the person using it against his upper front teeth, with the convex side outward; when so placed it communicates the vibrations caused by musical sounds or articulate speech to the teeth and bones of the skull, thence to the organs of hearing. For different sounds it requires to be focussed to different degrees of convexity. A simple strip of fine glazed mill-board has been recommended by some experimenters as cheaper and equally serviceable; and birch wood veneer has been used with success for the same purpose.

Au'dit, a term denoting an examination into accounts or dealings with money or property, along with vouchers or other documents connected therewith, especially by proper officers, or persons appointed for the purpose. Also the occasion of receiving the rents from tenants on an estate.

Audition. See EAR; HEARING.

Au'ditor. An auditor is an officer of the government, whose duty it is to examine the accounts of officers who have received and disbursed public moneys by lawful authority. In practice an auditor is an officer of the court, assigned to state the items of debit and credit between the parties in a suit where accounts are in question, and exhibit the balance. They may be appointed either by courts of law or equity. They are appointed at common law in actions of account, and in many of the States in other actions, under statutory regulations.

The auditor's report must state a special account, 4 Yeates, Penn. 514, giving items allowed and disallowed, 5 Vt. 70, but it is sufficient if it refer to the account, and it is their duty to report exceptions to their decisions of questions taken before them to the court, and exceptions must be taken before them, 4 Cranch, U. S. 308; 22 Bart. N. Y. 39; unless apparent on the face of the report. The report of the auditor as to facts is final in some of the States, unless impeached for fraud, misconduct, or very evident error. When the report is set aside in whole or in part, it may be referred back or may be rectified by the court, or accepted if the party in favor of whom the wrong decision is made, remits the item.

Auditory Canal. See EAR.

Auditory, or Eighth, Nerve, the nerve of hearing, and of the sense of position. It has its origin in two distinct portions of the ear, in reality being two distinct nerves, the *cochlear* and the *vestibular*, both of which are sensory in their function. The cochlear nerve originates in the cells of the organ of Corti in the cochlea of the ear, and is the one that carries sound impressions into the brain. The vestibular nerve has its origin in the semicircular canals and is the nerve that conveys the sense of localization of position. Both of these nerves soon join and run together in the internal meatus, where they lie in the same sheath for some distance with the seventh or facial nerve. They enter the medulla, the cochlear nerves forming the acoustic striæ on the floor of the fourth ventricle, and end about the superior olivary body and the nucleus of the trapezium. From here the fibres enter the fillet and end about the auditory centre in the brain in the second temporal convolution. Disease here causes auditory aphasia. The fibres of the vestibular branch end in the nuclei of Deiters and Bechterew in the medulla, and then further fibres pass for the most part into the cerebellum. Disease here causes cerebellar ataxia. See ATAXIA; APHASIA; EQUILIBRIUM; HEARING.

Audley, a manufacturing town in Staffordshire, England. Pop (1901) 13,700.

Audouard, ô'dowar', **Olympe**, French writer: b. 1830; d. 1890. She was married to a notary in Marseilles, but soon after divorced. She traveled in Egypt, Turkey, and Russia; and having conducted various journals in Paris since 1860, made a successful lecture tour through the United States in 1868-9. After her return she became interested in spiritism. She was an ardent advocate of woman's rights. Among her novels and books of travel may be mentioned: 'How Men Love' (1861); 'The Mysteries of the Seraglio and of the Turkish Harems' (1863); 'The Mysteries of Egypt Unveiled' (1865); 'War to Man' (1865); 'Across America' (1869-71); 'Parisian Silhouettes' (1883).

Audouin, ô'dooän', **Jean Victor**, French naturalist: b. Paris, 1797; d. 1841. He was professor of entomology in the Paris natural history museum and was the founder and first president of the Entomological Society. He wrote much respecting the injuries done by insects to vine and silk culture.

Audran, ô-drân', **Edmond**, French composer: b. Lyons, 1842; d. 1891. He composed several comic operas which were exceedingly

popular, among them 'La Mascotte' (1881); 'Olivette'; 'La Grand Mogul' (1884), 'Miss Helyett' (1890); 'La Ponpée.'

Audran, ô-dran', **Gerard**, French engraver: b. Lyons, 1640; d. Paris, 1703. After three years at Rome, where he acquired a high reputation by his engraving of Pope Clement IX., was recalled to France by Colbert, and appointed engraver to Louis XIV. Here he engraved the works of Lebrun, illustrating the battles of Alexander, and many paintings by Raphael, Titian, Domenichino, Poussin, and others. His nephews, **BENOTT** (b. 1661, d. 1721) and **JEAN** (b. 1667, d. 1756), were also engravers.

Au'drey, Saint. See **ETHELREDA**.

Audrey, â'drî, a shepherdess in Shakespeare's comedy 'As You Like It.'

Audsley, George Ashdown, Scottish-American architect: b. Elgin, Scotland, 6 Sept. 1838. He established himself in the United States in 1892, and subsequently became prominent both as an architect and author. In collaboration with his brother, **WILLIAM J. A. AUDSLEY**, he was author of several works—on illuminating, decorating, Christian symbolism, etc., and, individually, published 'Keramic Art of Japan'; 'Ornamental Art of Japan'; 'The Art of Chromolithography'; 'The Practical Decorator,' etc.

Audubon, â'dü-bôn, **John James Laforest**, American naturalist: b. Mandeville, La., 4 May 1780; d. 27 Jan. 1851. From 1827-38 he published a series of 1,065 colored figures of American birds in a descriptive work, 'The Birds of America,' which still holds its place as one of the most attractive and beautiful ornithologies of the world. He was a keen and sympathetic observer, rather than a trained specialist either in science or art. The full details of his life may be found in 'Audubon and His Journals,' by his granddaughter, Maria R. Audubon, with zoological and other notes by Elliott Coues (1897) and in an earlier biography by Lucy Audubon, as well as in 'The Life and Adventures of J. J. Audubon, the Naturalist,' by Robert Buchanan (1869). He was educated in France, and studied drawing for some time under the great artist, David, but in 1798 he returned to America and took possession of a farm owned by his father on the Perkiomen River, near Philadelphia. Here, in 1808, he married Lucy Bakewell, the daughter of an English neighbor; with her he moved to Kentucky and subsequently to Louisiana, meeting in both places with financial misadventures due to his inadaptability to attend properly to trade, which left him so poor that he was obliged to paint portraits and teach dancing and fencing. From his boyhood, however, in all fortunes, he had spent much time in sketching birds and studying their habits, and in 1826 he found means to take these sketches to England, where he elaborated them into the great series which made him famous and relieved his pecuniary troubles. In 1830 he returned to America to travel for new material and, in 1831, began the publication of his 'Ornithological Biography,' in five volumes. In 1842, after 12 years spent chiefly in explorations, he bought a home on the Hudson River at a spot considerably north of New York city at that time, but now

within the city limits and known as Audubon Park; here his two sons, Victor Gifford and John Woodhouse Audubon, also lived with their families. In 1843 the naturalist took another long journey, going to the Missouri River region. After 1844 he devoted himself with Dr. John Bachman (q.v.) and his sons, to a new publication, 'The Quadrupeds of America.' After 1847 his health began to fail. He was buried in Trinity Cemetery, New York.

Audubon Societies are organizations of bird-lovers who work to educate public opinion to a proper appreciation and protection of bird-life. They have now (1903) been organized in 30 States and have 60,000 members. Thus the efforts of a few lovers of birds have developed into a widespread movement of national importance. Hundreds of thousands of circulars, explaining the economic, educational, and esthetic value of birds, were distributed. Meetings were held; classes for bird-study formed. Whenever public opinion in a State seemed ripe, a bill was introduced in the legislature and many a law-maker was surprised to discover an active interest in birds that he had never suspected. Even the department of Agriculture at Washington began to inform him of their economic value. The bird law of the American Ornithologists' Union, which forbids the killing at any time of non-gamebirds, has been adopted in all the New England States, in New York, New Jersey, Delaware, Florida, Ohio, Kentucky, Indiana, Illinois, Wisconsin, Arkansas, and Wyoming. It is probable that within 10 years birds will be protected by law practically throughout the Union. But even then the labors of the Audubon Societies will by no means end. The laws must be enforced and the public conscience kept alive until sentiment enforces them.

Auenbrugger von Auenbrug, ow'en-brug'-ër fön ow'en-brug, **Leopold**, Austrian physician: b. Gratz, 1722; d. Vienna, 1809. As early as 1754 he had discovered the method of studying internal diseases (percussion) which made him famous; but not until after seven years of experiments and verification did he publish his treatise, entitled 'Inventum Novum ex Percussione Thoracis Humani Interni Pectoris Morbos Detegendi' (1761).

Auer, ow'er, **Adelheid von**, pseudonym of **CHARLOTTE VON COSEL**, German novelist: b. Berlin, 6 Jan. 1818. She is the author of many stories of real life, among them, 'Footprints in Sand' (1868); 'A Sister of Charity' (1870); 'In the World's Labyrinth' (1878); 'Castles in the Air' (1882).

Au'er, Alois, RITTER VON WELSBACH, Austrian printer: b. Wels, 1813; d. 1869. He was trained as a compositor and in his leisure moments acquired several languages, becoming a professor of Italian in the Gymnasium of Linz. From 1841 to 1868 he was at the head of the imperial printing office at Vienna. He made many typographical discoveries and published 'Die Sprachenhalle oder das Vaterunser in 608 Sprachen' (1844); and 'Das Vaterunser in 206 Sprachen' (1847).

Auerbach, ow'er-bah, **Berthold**, German novelist: b. Nordstetten, Wurtemberg, 28 Feb. 1812; d. Cannes, France, 8 Feb. 1882. He began to write while a student in Heidelberg, and under the pseudonym "Theobald Chauber" pro-

duced a 'Biography of Frederick the Great' (1834-6). A series of novels from the history of Judaism, under the collective title 'The Ghetto,' of which 'Spinoza' (1837) and 'Poet and Merchant' (1839) were printed in separate editions, was followed by a translation of Spinoza, with a critical biography (1841). 'Black Forest Village Stories' (1843), was received with universal favor, translated into nearly all European languages, and established his fame. To this class of tales belong also 'The Professor's Lady' (1847); 'Little Barefoot' (1856); 'Joseph in the Snow' (1860); 'Edelweiss' (1861); 'After Thirty Years' (1876). His first effort in the field of the novel, 'New Life' (1851), met with little favor; but 'On the Heights' (1865) constituted the crowning success of his literary career. It was followed by 'The Villa on the Rhine' (1868); 'Waldfried, a Family History' (1874); and 'The Head Forester' (1879).

Auerbach, Henry: b. 1482, at a place of the same name in Bavaria, the builder of the Auerbach court and cellar at Leipsic, mentioned in Goethe's 'Faust'. The building was erected in 1530, and tradition reports that five years after Dr. Faust was seen riding out of it on a barrel of wine. This tale Goethe has made use of in his famous poem.

Auerbach's Kell'er. See AUERBACH, HENRY.

Auerlite, a rare North Carolina mineral, remarkably rich in thorium, named after Dr. Carl Auer von Welsbach, the inventor of the Welsbach incandescent gas mantle. It was originally described as a hydrous silico-phosphate of thorium, $\text{ThO}_2(\text{SiO}_2 \cdot \frac{1}{2}\text{P}_2\text{O}_5) + 2\text{H}_2\text{O}$. It occurs in yellowish, zircon-like crystals of resinous lustre and having a hardness of 2.5 to 3 and a specific gravity of 4.1 to 4.7.

Auerstadt, ow'er-stët, a village in Saxony, famous for the great battle which took place there 14 Oct. 1806, between the French under Davoust, and the Prussian army under Duke Charles of Brunswick, which ended in a great victory for the former. The Prussians, who numbered 48,000, left nearly half of their men dead or wounded on the ground, while the French (30,000) escaped with a loss of only 7,000. Napoleon made Davoust Duke of Auerstadt.

Augean (â'jē-an) **Co'dex** (*Codex Augiensis*), a noted Greek and Latin MS of the Epistles of St. Paul, supposed to have been written in the 9th century, and so called from *Augia Major*, the name of a monastery at Rheinau. After passing through several hands it came, in 1718, to Dr. Bentley, who purchased it for 250 Dutch florins, and is now in the library of Trinity College, Cambridge. This MS. is written in uncial letters, and without accents; not *continua serie*, as is common with the more ancient copies, but with intervals between the words, and a dot at the end of each. The Greek text is written in capitals, the Latin in Anglo-Saxon letters; hence it is tolerably clear that it must have been written in the west of Europe, where that formation of the Latin letters, usually called *Anglo-Saxon*, was in general use between the 7th and 12th centuries.

Au'geas, in Greek legend, a king of Elis, famed for his stable, which contained 3,000 oxen and had not been cleaned for 30 years. Hercules was desired to clear the filth away in one

day, and Augeas promised if he performed it to give him a tenth part of the cattle. This task Hercules is said to have executed by turning the River Alpheus, or as some say, the Peneus, through the stable, which immediately carried away the dung and filth. Augeas refused to perform his engagement. Upon this a war ensued and Hercules conquered Elis and put Augeas to death.

Au'ger-shell, a common designation of the spiral gastropod mollusks of the *Tereboidæ* family. The shells are slender and tapering, sometimes ending in a sharp point, and are usually decorated with brown, orange, and red spots or patches. More than 200 species are known, all inhabitants of tropical waters, where they occur from the shallow waters of the shore to very great depths.

Augereau, ôzh-rô', **Pierre François Charles,** Duke of Castiglione, a marshal of France: b. Paris, 1757; d. 12 June 1816. He distinguished himself in 1794 as general of brigade in the army of the Pyrenees, and in 1796 as general of division in the army of Italy. He made himself master, 16 April, of the entrenched camp of the Piedmontese at Ceva, afterward of that at Casale; threw himself on the Bridge of Lodi, and carried it with the enemy's intrenchments. 1 August he came to the assistance of Masséna; maintained during a whole day a most obstinate struggle against a superior number of troops and took the village of Castiglione, from which he derived his ducal title. In the battle of Arcole, when the French columns wavered, Augereau seized a standard, rushed upon the enemy, and gained the victory. The directory bestowed this standard on him 29 Jan. 1797. In 1799 he was chosen a member of the Council of Five Hundred, and therefore resigned his command. He then obtained from the consul Bonaparte the command of the army in Holland. Being superseded in October 1801, he remained without employment till 1803, when he was appointed to lead the army collected at Bayonne against Portugal. When this enterprise failed, he went back to Paris, and 19 May 1804, was named marshal of the empire, and grand officer of the Legion of Honor. In July of this year the king of Spain sent him the order of Charles III. He contributed to the successes which gave birth to the peace of Pressburg, and in March 1806, had possession of Wetzlar and the country around, until, in the autumn of this year, a new war called him to Prussia. Early in 1811 Napoleon gave him the command of a corps in the army of Spain. After the entrance of the allies into France, he made submission to Louis XVIII., who made him a peer. Napoleon, on his landing in 1815, declared him a traitor. Augereau, however, expressed himself in his favor, but took no active part in the new order of things. After the return of the king he took his place again in the chamber of peers.

Augier, ôzh-yā', **Guillaume Victor Emile,** (ôzh-yā'), French dramatic poet: b. Valence, 20 Sept. 1820; d. 25 Oct. 1889. 'La Cigüe,' his first piece, in two acts, after being rejected at the Théâtre Française in 1844, was accepted by the managers of the Odeon Théâtre, and there brought out. It had a run of three months, and established the popularity of the author. The

AUGITE — AUGUST

latter subsequently produced other light pieces. These, however, were thrown in the shade by 'Gabrielle,' a five-act comedy, which has been pronounced by competent critics to be Augier's most finished and best constructed work, whether as regarding lot, poetry or the delineation of character. At the solicitation of Mlle. Rachel, Augier wrote 'Diane.' In 1868 his 'Fils de Giboyer' was successful. The style of Augier is at once classic and easy, dignified and yet pictorial. He may be said to have founded a new school in French dramatic literature, and his works, partly by their originality, and partly by intrinsic merit of a kind possessed in common with other dramatic productions, have acquired very great popularity.

Aug'ite. See PYROXENE.

Augsburg, owgz'bürg, a city of Bavaria; situated on a plain, 35 miles northwest of Munich. It was founded by the Emperor Augustus, 12 B C. The streets are narrow but picturesque, the buildings retaining many mediæval characteristics. Among the most notable are the cathedral, arsenal, town hall and Abbey of St. Ulrich. Napoleon III. received his early education in a gymnasium of this city. It is a centre of the book trade. Augsburg has been prominent since the Middle Ages for its commercial and financial operations and was long the home of merchant princes such as the Fuggers. It was the scene of the Augsburg Diet. It was a free city till 1806, when Napoleon ceded it to Bavaria. Pop. (1900) 88,700.

Augsburg Confession, a document adopted by the Protestants in 1530 as a declaration of faith. Charles V., on his accession to the throne of Germany (1520), found his new dominion the theatre of religious dissensions. The insurrection in Castile, and the war with France and Italy, called Charles into Spain, diverting his attention from the Lutheran schism. The Diet of Spires (1529) had issued a decree for the purpose of conciliating the Lutherans to the proposed Roman Catholic reform, and uniting them against the Sacramentarians and Anabaptists. At this juncture, Charles returned, and the German princes and estates were summoned to convene in diet at Augsburg in June. The summons was conciliatory, and called for aid against the Turks, making no reference to the religious difficulties of the kingdom, further than to promise at no distant time a speedy adjustment of them. On the 25th of the month, a confession, prepared by Melancthon, and approved by Luther, was presented and read by Dr. Christian Bayer in the diet. This confession is said to have been prepared on the basis of the Swabach and Torgau articles, although these had been drawn up (1528-9) in the attempt to unite with the Zwinglians, and the object of the present confession was to become reconciled to the Roman Catholic reform party. A copy of the confession, in German and English, was delivered to Charles. Two days after the reading of the confession, it was delivered to the Roman Catholic theologians for a reply. The reply was read in the diet on 3 August following, and called forth from Melancthon a defense (*Apologetica Confessionis*), which was afterward enlarged and published in Latin, and then in German. The object of the Augsburg Confession was not attained, and the edict of the emperor

(22 September) gave the Lutherans until the following April to bring themselves into conformity with the requirements of the Church, and required their co-operation with the throne against the Zwinglians and Anabaptists. The Augsburg confession and Melancthon's defense were generally circulated in western Europe, and became a sort of rallying point among the reformers.

Augsburg, League of, a league concluded at Augsburg, 9 July 1686, for the maintenance of the treaties of Münster and Nimeguen, and the truce of Ratisbon, and to resist the encroachments of France. The contracting parties were the Emperor Leopold I., the kings of Spain and Sweden, the electors of Saxony and Bavaria, and the circles of Suabia, Franconia, upper Saxony and Bavaria.

Augsburg Seminary, an educational institution in Minneapolis, Minn., under the auspices of the Lutheran Church. It was organized in 1869 and reported in 1902: Professors, 10; students, 170; grounds and buildings valued at \$50,000; income, \$12,250; graduates, 374.

Au'gur, Christopher Colon, American military officer: b. New York, 10 July 1821; d. Washington city, 16 Jan 1898. He was graduated at the United States Military Academy in 1843; became major of the 13th United States Infantry in 1861; colonel of the 12th Infantry in 1866; brigadier-general, United States army, 4 March 1869; major-general in the volunteer service in 1862; mustered out of that service in 1866; and was retired in the regular army, 16 July 1885. He commanded a division in the battle of Cedar Mountain, being severely wounded.

Au'gur, Hezekiah, American sculptor: b. New Haven, Conn., 21 Feb. 1791; d. 10 Jan. 1858. 'Jephthah and His Daughter,' in the Trumbull gallery at Yale, is the most important of his works. In addition to his skill as a sculptor, he possessed much mechanical genius, inventing among other machines one for carving wood.

Au'gurs, a celebrated college of diviners in ancient Rome, who predicted future events and determined the will of the gods from the occurrence of certain signs, connected with thunder and lightning; the flight and cries of birds; the feeding of the sacred chickens; the action of certain quadrupeds or serpents; accidents, such as spilling the salt, etc. The answers of the augurs and the signs were called auguries; bird-predictions were auspices. Nothing was undertaken without the advice of the augurs, and by the words *alto die* ("meet on another day"), they could dissolve the assembly of the people and annul decrees passed at the meeting.

August, ow'güst, the name of many princes of the German principalities: (1) AUGUST WILHELM, prince of Prussia, brother of Frederick the Great, and general in the Prussian army: b. Berlin, 9 Aug. 1722; d. 12 June 1758. He took an active part in the Silesian campaign, and distinguished himself at the battle of Hohenfriedberg (in June 1745), but owing to the fatal retreat of Zittau, in 1756, he incurred the displeasure of his brother, and withdrew from the army. This conflict between the two brothers led to a correspondence, which was published in 1769. (2) AUGUST EMIL LEOPOLD, duke of Saxe-Gotha and Altenburg, successor to the throne,

AUGUST—AUGUSTA

20 April 1804. He was twice married, and the first marriage left him issue, one daughter, who became the reigning duchess of Saxe-Coburg, and died in 1822. By the second marriage he had no children, and on his death he was succeeded on the throne by his brother, Frederick IV., with whose decease, 11 Feb. 1825, the line of Saxe-Gotha became extinct. Duke August Emil Leopold was a favorite of Napoleon, and his duchy enjoyed perfect immunity from the burdens of French invasions and French wars. He was a man of taste and considerable literary talent. (3) **AUGUST FRIEDRICH WILHELM HEINRICH**, prince of Prussia: b. 19 Sept. 1790; d. 19 July 1843, in Bromberg; the son of Prince August Ferdinand, the brother of Frederick the Great, who died in 1813. He was considered one of the richest men in Prussia, and left various children bymorganatic marriages. He took an active part in the campaign against Napoleon in 1806, by whom he was taken prisoner, and detained in Paris until after the peace of Tilsit. On his return to Prussia in 1813, he resumed his duties in the Prussian army, fought at Dresden, Ulm, and Leipsic, distinguished himself during the campaign of 1814, on various occasions, and bore throughout his life the character of a gallant soldier and an upright man. (4) **AUGUST PAUL FRIEDRICH**, grand duke of Oldenburg: b. 1783; d. 27 Feb. 1853; mounted the throne 21 May 1829, under the title of grand duke, which had been conferred upon his family by the Congress of Vienna; but of which his father had never availed himself. When Oldenburg was invaded by the French, in 1811, he accompanied his father to Russia, where his younger brother (b. 1784, d. 1812) was married to the Grand Duchess Catharine. He distinguished himself in the Russian war, and in 1813 was appointed governor of Revel. His reign, after his return to Oldenburg, was marked by political and material progress. In 1830 he concluded a treaty with Prussia for the annexation of Birkenfeld to the Prussian-Hessian Zollverein, and a reciprocal treaty of navigation. In 1836 he prevailed upon Hanover and Brunswick to make satisfactory arrangements for the regulation of excise duties. In 1831 he laid the foundation for a constitution of Oldenburg, which was ratified in 1848, and which, although modified in 1852, still secures much civil and religious freedom to the people. In 1817 he married the Princess Adelaide of Anhalt-Bernburg, who died in 1820, leaving him two daughters, Frederica and Amalie; the latter, in 1830, married King Otho of Greece. In 1825 he married the sister of his first wife, Ida, who died in 1828, having borne him a son. In 1831 he married for the third time, Cecilia, youngest daughter of the former king of Sweden, Gustavus Adolphus IV., who died in 1844, leaving a son. He was succeeded by his first son, Nicholas Frederick Peter, grand duke of Oldenburg.

Au'gust, the eighth month of our year, named by the Roman Emperor Augustus after himself, being associated with several of his victories and other fortunate events. Before this it was called Sextilis or the sixth month (counting from March). July had been named for Julius Cæsar, and the Senate, to gratify Augustus, decreed that August should have equal length, taking a day from February.

Augus'ta, a title first given to his wife Livia, after the death of Augustus, according to the will of the emperor. It was afterward conferred by Claudius on Agrippina (51 A.D.), and by Nero on his wife, Poppæa, as well as her daughter (64 A.D.). Eventually it became a common title of the mother, wife, sister, or daughter of an emperor.

Augusta, ow'gus-ta, **Marie Luise Katharina**, a queen of Prussia, and empress of Germany: b. 1811; d. 1890. She was the daughter of Charles Frederick, grand duke of Saxe-Weimar, and was educated at the Weimar court. In 1829 she married William, then crown prince of Prussia, afterward emperor of Germany.

Augus'ta Victoria, duchess of Schleswig-Holstein-Sonderburg-Augustenburg: b. 22 Oct. 1858. She is the daughter of the late Duke Friedrich; married Prince Friedrich Wilhelm, afterward Wilhelm II., 27 Feb. 1881, and became empress of Germany and queen of Prussia on the accession of her husband to the thrones in June 1888. In 1900 she had borne the emperor seven children, the crown prince, Friedrich Wilhelm, being born 6 May 1882.

Augus'ta, Ga., the third city of the State in population and wealth. It is the capital of Richmond County, and at the head of navigation on the Savannah River, 231 miles by water above its mouth. It is 132 miles by rail from Savannah, 171 miles east of Atlanta, and 137 miles northwest of Charleston. It lies about 150 feet above sea level, has an even temperature and dry, invigorating atmosphere very different from most riverside cities, being indeed a well-known health resort for pulmonary invalids, particularly its suburb Summerville, on the Sand Hills 400 feet above it. It is laid out in broad rectangular streets, many of them beautifully shaded, and with a good electric car service; and has several parks, of which the chief is May Park of about 11 acres. The city hall is in a park containing a granite monument to the Georgia signers of the Declaration of Independence; while on Broad Street, the principal thoroughfare of the city, is a noble monument to the Confederate dead. The cemetery and fair grounds are also suburban attractions.

Manufactures.—The power is chiefly derived from a dam across the river seven miles above the city (enlarged from a smaller one in 1875, at a cost of about \$1,000,000), 150 feet wide at top, 106 at bottom, and 11 feet deep; turning a part of the river into a canal affording 14,000 horse-power, sold to industries at \$5.50 per horse-power per annum, with a working day of 16 hours. Augusta is one of the chief seats of cotton manufacture in the South. Eli Whitney's cotton gin was invented on a farm on the outskirts, and the first working gin was set up in the city. In 1902 there were 13 cotton mills with offices in the city, having a capital of nearly \$6,000,000, operating 329,740 spindles, and 19,360 looms, and employing some 8,000 hands. During 1899, of about \$8,000,000 new capital invested in Georgia cotton manufacturing, fully a third was in Augusta. There are also four large cotton-seed oil mills, and a bleachery. Of other manufactures, the chief are of lumber and wood products, bricks and tile drain pipe from the fine clays in the vicinity, flour, and iron goods. In 1900 there were 388 manufacturing establishments, with \$9,016,619 capital and 7,042 em-

AUGUSTA

ployees; paying \$2,093,915 for wages and \$6,244,286 for materials; and having a total output valued at \$10,069,750. The increase within the past three years, however, has been very large; and it is proposed to utilize the river still more for electric power, the present manufacturing factories practically exhausting the direct water power. The river at Augusta is about five feet deep the year round, and fair-sized passenger and freight steamers make semi-weekly trips to Savannah. Augusta is the largest inland cotton market in the South; and it has also a large shipping trade in lumber, fruit and vegetables. Its annual trade exceeds \$80,000,000, its cotton receipts amounting to 200,000 bales. The water supply is derived from the Savannah River and is unlimited. The city abounds in educational and charitable institutions. Most notable among the former is the Georgia Medical College, a branch of the State University at Athens; there are also Richmond Academy, which has recently been put under the care of the State University; Saint Mary's and Sacred Heart (Roman Catholic) academies, Paine's Institute for Colored Students, and high schools for white and colored youth. There is also a public library of 10,000 volumes. There is an orphan asylum, two public hospitals (white and colored), a juvenile reformatory, and the Louise King Home. A United States arsenal, a Masonic temple, an Odd Fellows' hall, a Chamber of Commerce, and a cotton exchange are also among the notabilities. The city has three daily and several weekly newspapers. The assessed property valuation exceeds \$20,000,000, and the bonded debt in 1900 was \$1,752,300. There are two national and several state banks. Augusta is on the line of many railroads, among them the Central of Georgia, the Charleston & West Carolina, the South Carolina & Georgia, the Southern, etc. Its original charter was obtained in 1798, and revised 1882; the mayor is elected for three years, and a city council, consisting of 15 members, is also elected for three years, one third being elected each year. The board of education is elected by the people. All other offices are appointive by the council, save that the mayor appoints the superintendent of canal and waterworks, and of streets and drains.

Population—In 1800, 2,215; (1840) 6,403; (1852) 10,217; (1860) 12,493; (1870) 15,389; (1880) 21,891; (1890) 33,300; (1900) 39,441. It suffers on the census returns, however, from having suburbs, North Augusta, across the river in South Carolina; Summerville, and others not counted in; and claims about 60,000 at present.

History—Augusta was founded in 1736 by Gen. James Edward Oglethorpe (q.v.), the founder of Georgia, and named after the Princess Augusta of Saxony, who married Frederick, Prince of Wales, in that year, and became the mother of George III. All through its early period it was the chief trading station in Georgia, and a very important military post; especially notable as the seat of conferences and treaties with the southern Indians, who under the treaties of 1763 and 1773 ceded large tracts of land to the whites; the latter, however, had to occupy much of it at the same risk of Indian warfare as before. In 1778 it was made the State capital, and remained such till

1798. The building of the Georgia railroad in the middle of the 19th century was a heavy blow to its prosperity for a time, carrying trade over new routes; but its natural advantages enabled it to recover itself.

THOS. W. LOYLESS,
Editor 'The Augusta Chronicle.'

Augusta, Maine, city county-seat of Kennebec County and capital of the State; on the Kennebec River, 40 miles above its mouth, at the head of tidal navigation, and on the Maine Central R.R., 63 miles northeast of Portland. It is situated on both sides of the Kennebec, mainly on the right or west bank, and some portion of it, including much of the residential section, occupies an elevation considerably above the river, along which the principal business part of the city extends. The Augusta, Winthrop and Gardiner electric railway connects the city with neighboring places, and its water communications afford excellent facilities for travel and trade.

Public Buildings and Institutions.—The State Capitol is a handsome granite building, for which the stone was quarried from the surrounding hills. It stands on high ground overlooking a wide extent of pleasant country. Among other noteworthy buildings are those of the Maine Insane Hospital, the City Hospital, the public library, the county buildings, and the United States arsenal. The churches include those of the Congregationalists, Episcopalians, Free Baptists, Colonist Baptists, Christians, Universalists, Unitarians, Methodists, Roman Catholics, and the People's Church. The public schools include all grades from the primary to the high school. In the capitol are the State library, a notable collection of portraits of American statesmen, and, in the rotunda, an impressive array of the Civil War battle flags of Maine soldiers. In the principal park is a soldiers and sailors' monument.

Industries.—Augusta, by reason of its railroad and river facilities, is the trade centre of a large region, and the water-power furnished by the Kennebec, across which, just above the city, extends a dam nearly 1,000 feet in length, affords abundant means for manufacturing. The cotton factories here employ about 1,100 persons; shoe manufacture, 300; pulp mill, 250; lumber mill, 100; sash and blind factory, 75; and besides various smaller establishments the city has publishing houses in which some 400 persons are employed.

Banks, etc.—There are two national banks in the city, with a combined capital of \$350,000, a trust company having a capital of \$100,000, and two savings banks. The deposits of these institutions aggregate \$11,000,000.

Municipal Government.—The city is governed by a mayor and a city council, a body consisting of boards of aldermen and common council, elected by the people.

History.—Augusta was first permanently settled in 1754 by colonists from Massachusetts; was incorporated under the name of Hollowell in 1771; and upon the setting off of Hollowell in 1797 became a separate town. In 1831 it became the capital of the State, and has been the scene of many important political events. It received a city charter in 1849. Its population in 1900 was 11,683; in 1903 it was estimated at 12,031. The employees of the cotton factories

AUGUSTA—AUGUSTINE

are mostly French Canadians, the other inhabitants chiefly natives. Consult: North, 'History of Augusta' (1870). **FRED'K W. PLAISTED,**
Editor 'The New Age.'

Augus'ta, the name of many ancient European towns, as Augusta Trevirorum, now *Treves*; Augusta Taurinorum, now *Turin*; Augusta Vindelicorum, now *Augsburg*, etc.

Augus'ta, a city of Sicily. See **AGOSTA**.

Augus'ta His'toria, a series of Roman biographies of the emperors from the accession of Hadrian to the death of Carinus, the predecessor of Diocletian a period covering 167 years. The writers included in this collection are six in number, namely, Ælius Spartianus, Julius Capitolinus, Ælius Lampridius, Valsatius Gallicanus, Trebellius Pollio, and Flavius Vopiscus, of Syracuse.

Augus'tan Age, the Latin literary epoch of the reign of the emperor Augustus Cæsar. During this period Horace, Ovid, Virgil, Tibullus, and other writers flourished; also great patrons of literature like Mæcenæ. The purest Latinity belongs to the authors of the Augustan age. The name is applied in England to the reign of Queen Anne (1702-14). By far the foremost name is that of Sir Isaac Newton, and of commanders, John Churchill (Duke of Marlborough). The poets were Congreve, Garth, Gay, Parnell, Philips, Pope, Prior, Rowe, and Swift. The other authors were Addison, Barnes, George Bull, Anthony Collins, Jeremy Collier, Roger Cotes, Defoe, Dodwell, Flammesteed, George Hickes, Dr. John Jeffery, John Norris, Ray, South, Steele, etc. Wren, Archibald Pitcairn, and Sir Cloudesley Shovel also lived in this reign.

Au'gusta'na Col'lege, a co-educational institution in Rock Island, Ill., organized in 1860 under the auspices of the Lutheran Church; reported in 1902: Professors, 31; students, 250; volumes in the library, 18,000; ground and buildings valued at \$166,000; productive funds, \$225,000; income, \$32,119; graduates, 881.

Au'gustine, Saint (AURELIUS AUGUSTINUS), one of the most renowned fathers of the Christian Church: b. Tagaste, in Numidia, 13 Nov. 354; d. Hippo, 28 Aug. 430. His father, Patricius, was a pagan, his mother, Monica, a Christian. He has related his own early life in the work to which he gave the title of 'Confessions.' His mother instructed him in Christianity, but for many years this faith had little influence on his life. He was long devoted to pleasure, and when quite young became father of a son by a woman with whom he was not connected by marriage. He was intended for the profession of rhetorician, and was sent to Carthage to study with this object in view. Cicero's work, 'Hortensius,' which has not come down to our times, first led him to speculative studies, and he now became a member of the sect of the Manichæans. He was one of their disciples for nine years; but after having obtained a full knowledge of their doctrine, he found it unsatisfactory and left them. In 383 he left Africa for Rome, and after a short stay there proceeded to Milan, where he was invited as a teacher of rhetoric. St. Ambrose was bishop of this city, and his eloquent discourses, combined with the study of the Scriptures, converted Augustine to the orthodox faith, and wrought an entire change in his life

and character. His conversion appears to have taken place in 386. He now retired into solitude, and prepared himself for baptism, which he received in the 33d year of his life, together with his son Adeodatus, from the hands of Ambrose, his mother being then with him. Returning to Africa, he sold his estate, and gave the proceeds to the poor, retaining only enough to support him in a moderate manner. For three years he lived a retired life, devoting himself to religious duties, and to the composition of several treatises. Chancing on one occasion to be present in the church at Hippo, the bishop, who was a very old man, signified a desire to consecrate a priest to assist and succeed him. At the desire of the people Augustine entered upon the holy office, preached with extraordinary success, and in a few years became Bishop of Hippo. The remainder of his life was occupied with his ecclesiastical labors, and with various controversies in which he warmly engaged, such as those with the Donatists, the Manichæans, and more especially the Pelagians, concerning the doctrines of free-will, grace, and predestination. Augustine maintained the necessity of divine grace in determining man's moral acts to salvation, and he supported the doctrine of predestination, including election and reprobation, but always allowing for free-will and for the merit of the individual. His authority has always been very influential in the Roman Catholic Church, and his view upon any doctrinal matter has at all times carried great weight and is constantly cited in controverted questions. He died at Hippo, while the town was besieged by the Vandals. There have been more learned fathers of the Church, but none have ever more powerfully touched the human heart, and warmed it toward religion. Painters have, therefore, given him for a symbol a flaming heart. His writings (which are in Latin) are very numerous. The most celebrated are his 'Confessions' (belonging to the year 397), his 'De Civitate Dei' (On the City of God), a work on the Christian Church, his treatise on the Trinity, 'Christian Doctrine'; 'Nature and Grace'; 'Grace and Free-Will'; 'Immortality of the Soul,' and his 'Letters.' His works have been published at Paris in 22 volumes, and an English translation in 15 volumes has appeared at Edinburgh, edited by Dr. Marcus Dods. See Neander, 'Church History'; Milman, 'Latin Christianity'; Farrar, 'Lives of the Fathers,' etc. Two monastic bodies, the *Augustinian Canons*, or *Black Canons*, and the *Augustinian Hermits* (q.v.), claimed to derive their origin from St. Augustine. Life by Hatzfeld.

Au'gustine, or Austin, Saint, the first archbishop of Canterbury: d. 26 May 604. While prior of the Benedictine monastery of Saint Andrew at Rome he was selected by Pope Gregory I., together with 40 other monks, to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman See in Britain. In the spring of 597 the missionaries landed on the Island of Thanet and were kindly received by Ethelbert, king of Kent, whose wife Bertha was already a Christian. The conversion of the king speedily followed, contributing greatly to the success of Augustine's work, large numbers of persons were converted and baptized, and it was soon manifest that a new influence for good had come into the lives of

AUGUSTINIANISM

the Anglo-Saxons. In acknowledgment of his success, the Pope directed Augustine in 597 to go to Arles, where he was consecrated archbishop of Canterbury and metropolitan of England. On his return he at once informed the Pope of his success, sending a presbyter and a monk to Rome for that purpose and also to obtain instructions concerning other questions with regard to the propagating of the faith. The answer of Gregory to the archbishop's inquiries are fine examples of tact, good sense and judgment in dealing with the problems confronting the early missionaries, and instead of destroying the heathen temples they were converted into Christian churches. Saint Augustine was a zealous missionary of the Church and labored with untiring energy to extend the authority of the Church and to convert the ancient Britons, whom the English had driven into the mountains of Wales. In this, however, he was only partially successful, some of the British bishops refusing to acknowledge his authority and to unite with the English Church. Augustine died in Canterbury, and eight years afterward his body was removed to the Cathedral of Canterbury. Consult: Bede, 'Historia Ecclesiastica Gentis Anglorum'. Mason, 'The Mission of Saint Augustine to England' (1897).

Augustinianism, the system of philosophy and theology taught by Saint Augustine. In order to reach a just estimate of the teachings of Augustine, we must remember that we are not dealing with a philosopher simply, or with a theologian simply, but with one whose nature combined in a marked degree, the philosophical and theological strains together. He was both philosopher and theologian. These elements are so mixed in him at times as to reciprocally reinforce one another, but again so disparate as to cause irreconcilable inconsistencies and bold contradictions. There is a most excellent analysis of this exceedingly complex nature by Teuffel in his 'History of Roman Literature,' remarkable alike for its comprehensiveness and brevity. "Augustine combined in his character qualities seemingly opposite: an abundant imagination, and penetrating intellectual vigor, a passionate want of regard and affectionate tenderness, a tender heart and zealotism, a blind belief in superior authority and originality of thought, zeal for unity of the Church and individual piety, romanticism and scholasticism, mysticism and sophistry, poetical talent and philosophical genius, rhetorical pathos and grammatical pedantry, — himself a psychological mystery." With this portrait of his personality before us, let us examine his teachings. For him, the source of all truth is to be found in the interpretation of the inner experience. His philosophy is primarily anthropocentric. In consciousness lies the assurance of the reality of one's own being. This is the earnest and the warrant of all reality. Without this central and elemental knowledge all other knowledge would be vague, and illusory. This assurance is given even in the very act of questioning it; for, as Augustine insists, the simple fact that I am conscious of doubting even the doubting of my own reality, is in itself an indication that I the doubter am. Man cannot escape himself. Such an analysis of the implications of self-consciousness forms a striking anticipation of Descartes' famous *Cogito ergo sum*.

With the reality of human personality firmly established upon a basis which even the most searching skepticism is unable to shake, but on the contrary the rather confirms, Augustine proceeds through a profound analysis of the human reason to disclose abundant intimations of a divine reason, and therefore of a divine being. For in his subtle examination of the processes of reason, he points out that these processes are ever working toward one and the same end, — the constructing of a body of knowledge consisting of truths universally valid, that is, truths which hold not merely for the individual but which necessarily hold for all individuals, under all circumstances and at all times. They become moreover, the norm or standard for all our thinking and their sway embraces the complete range of all human activity. These truths are so universal, so complete, so commanding as to indicate a oneness of origin which can be nothing less than that of an eternal mind. Moreover, the eternal mind must be an eternal personality. The universal truths, therefore, which lie at the basis of all thought, of all being, of all desire, and all activity are according to Augustine ideas in God. In regarding the Absolute as not merely the sum total and unification of all truth, the *unum, verum bonum*, but also a living personality, the divine Logos, we recognize the marks of the religious teacher, and in this respect Augustinianism is to be regarded as a significant advance beyond the doctrines of Neo-Platonism. From this exposition, it should not be inferred, however, that in the Augustinian psychology, the primary, or the sole basis of our conscious life is knowledge. On the contrary it is quite evident throughout the works of Augustine that he exalts the will above knowledge. He finds in consciousness three elements, *memoria, intellectus, voluntas*. Of these *memoria* is equivalent to a reproducible idea (*Vorstellung*), an idea which, moreover, carries with it the warrant of the reality which underlies it as its ground; *intellectus* is the judgment; and *voluntas* of course, the will. The three form a psychological trinity corresponding to the trinity which is manifested in the unity of the divine nature. Both in God and man, the will is supreme. *Omnes nihil aliud quam voluntates sunt*.

Certain difficulties emerge at this point in the exposition of the Augustinian system owing to the shifting of the point of view. The philosopher gives way to the theologian. Augustine's philosophy is essentially anthropocentric; his theology, theocentric. And in discussing the relations which obtain between God and man Augustine naturally subordinates the human to the divine, so much so indeed that the Augustinian system is severely criticised because, as it is alleged, it leads logically to a pantheism which wipes out the individuality and responsibility of man. For Augustine insists that to appreciate divine truth and the will of God for man there is need of an inner spiritual illumination, and that such an illumination comes only to the soul in which faith resides, and that faith is the gift of divine grace. Faith, therefore, must precede knowledge, that is, knowledge of things divine and knowledge of things as they are. Insight may be regarded as the fruitage, but faith is the root of knowledge. There is a grave difficulty at this point in reconciling such a doctrine with Augustine's fundamental posi-

AUGUSTINIANS

tion which puts supreme emphasis upon the dignity and worth of man's inner nature, and the trustworthiness of that inner guiding light. It can only be said by way of explanation that in the one the theologian, and in the other, the philosopher, speaks.

Moreover, in this view of the human consciousness the primacy of the will is in a large measure denied by the insistence that man is wholly dependent upon divine grace in order to exercise his will aright. He alone is free, says Augustine, whose will has been touched by the divine will, and whose desires and activities are found wholly in accord with the will of God. The natural man is not free unless emancipated by divine grace; for Adam, the representative of humanity, the federal head of the race, abused his natural freedom of will and in his fall has left as an inheritance to the race the tendency to sin. And the most significant consequence of sin is the bondage of the will, which divine grace alone can overcome. Augustine, therefore, seems to solve the problem of free will and predestination by denying to man a real freedom. He indulges in many subtle distinctions as to the various kinds of grace. There is, for instance, the prevenient grace, also the supporting grace, active grace, and grace bestowing the gift of perseverance which seals all previous effects. No distinction, however, is drawn which relieves the system from the criticism already mentioned of minimizing the autonomy of the human will.

This position of Augustine naturally raises the question as to how the evil in the world can be reconciled with the idea of divine power and divine goodness. For if God alone is free, He alone is responsible; and man should not be held accountable for that which he unaided is unable to prevent. Such a criticism Augustine meets by the statement that the evil in the world is after all not a real evil; it is not a *causa efficiens*, but merely a *causa deficiens*, in fact only an *incausale*. Such an explanation, however, is not satisfactory and does not squarely meet the difficulty of the problem which the common experience of humanity all too unhappily emphasizes.

Augustine's type of mind is essentially that of a great systematizer of doctrine. He could rest content with no form of knowledge unless it could be reduced to a *schema* in which part fitted to part in an exact and inflexible manner. Augustine's system has been criticised for this very reason that its lines are hard and fast, yielding at no point the full rigor of its inexorable doctrines. But while in a certain sense such a criticism is justified, there was, in addition to this pronounced synoptical tendency of thought, an equally profound strain of sentiment and feeling. Augustine was essentially human, and wont to be moved by the passions and aspirations common to man. Within the very body of this system of doctrine, and its closely concatenated dogmas, it is possible to discover a deep underlying current of mysticism, which may be traced no doubt to its source in Neo-Platonism,—a mysticism manifesting itself in that compulsion of the soul, to long for communion with God, and to behold Him face to face. It is this intensely human strain, this mystical element, which relieves the Augustinian system as a system from its more severe and sombre features. The great system builder after all subordinates the system to that which is the ground of the

system. Not in the processes of reason, but in a direct and immediate consciousness of God, does he find the ultimate certitude. Nothing can more beautifully or more adequately express this mystical strain in Augustine's nature than those words which embody both a philosophy and a creed: "Thou hast made me for thyself and my heart is restless until it finds rest in thee."

JOHN GRIER HIBBEN,
Professor of Philosophy, Princeton University
Augu'stin'ians, hermits of St. Augustine (calced), brotherhood of churchmen, devoted to the spread throughout Christendom of the principles of the higher life, of religion as well as earthly science, and searchers, too, after peace of the spirit, established in the 4th century, at Tagaste in Africa, by the famed St. Augustine, later Bishop of Hippo and illustrious doctor of the Church. Up to the 13th century Augustinians were engaged mainly in the practices of ascetic life, a course of seclusion, or retirement, from the bustle and troubles of worldly affairs in trade, politics, commerce. As hermits, at first they lived, some alone in their cells in out-of-the-way places in forest and mountain, others in community-groups outside of towns. Here their life was passed in quiet, in contemplation, study, prayer, copying MSS, and manual toil, as farm, and garden-work, reclaiming waste lands, digging canals for irrigation and drainage. Eminent among them in this peaceful era were two reformers of their brotherhood, famed in hagiography, who by centralizing the energies of their followers on set lines of work, sought to render their societies more potent factors for the common good, as adepts in intellectual, artistic, and more industrial spheres. William IX., duke of Aquitaine, an old-time leader in the crusades, now a dweller in a monastery of the Tuscan hills, and John Bonus, The Good, of Mantua, a one-time strolling player by profession, now penitent, who by their wonderful powers of nature and grace employed in the service of their respective communities, reached high rank in the world of saintly heroism in southern Europe, in France, and Italy, then in the north, in Germany and England, wherein were founded congregations under their rule. Spreading thence throughout the various quarters of Christendom, especially in western Europe, their followers settled in Spain, Portugal, Belgium, and Ireland, where they established houses of their brotherhood in the principal cities and towns of the civilized world. In 1256, in pursuance of the designs of his predecessors in the papal chair, Alexander IV. moved to ensure the complete union of all the different congregations of Augustinians in Europe, succeeded finally in merging their several branch orders into one body politic and social under the leadership of Lanfranc Septala, of noble Milanese birth, the first superior general of the Augustinian Hermits, chosen thereto in the first general chapter of the brethren at Rome in the above year. Nor were the successors of Alex-

AUGUSTULUS—AUGUSTUS

ander slow in their recognition of the powers of this new association. To them were entrusted several places of honor in the pontifical court, among them the offices of apostolic confessor, of librarian, papal sacristan, the latter subsequently declared by Sixtus IV. as of perpetual right of the Augustinians. Not long after they were entrusted with the collection of papal revenues in many countries, and even charged by some of the republics of Italy with the handling of state funds.

In the Middle Ages as in later days many of this brotherhood won fame in the higher realms of life, by their gifts of spirit in science and art, as saints, writers, masters in theology, Scripture-study, philosophy, history, law, antiquities, letters and poetry. Celebrated as teachers in schools of their order as well as outside were such masters as Egidius Colonna of Rome, known as the "Fundamental Doctor"; then Augustine of Ancona, who won renown in scholastic theology; John Capgrave in history; Onuphrius Panvinio in antiquities; Luis de Leon in theology and poetry; John Laurence Berti in history; John Baptist Cotta in poetry, John Michael Cavalieri in liturgy, and lately Augustine Ciasca in Oriental languages. Eminent for their supernatural gifts, many of the most singular character, were Nicholas of Tolentine, "wonder-worker of the Church," so styled by Pope Eugene IV.; Clare of Montefalco, the stigmatized, in whose heart were discovered the insignia of Christ's passion; Rita of Cascia, ecstatic, known as "the saint of the impossible"; Thomas of Villanova, almsgiver of Spain, and John de Schagun, reformer of the clergy of that country. They are of prominence from the 16th century especially in various mission fields in Mahometan and heathen countries; in Asia, in China, India, Persia, Japan, and the Philippines; in Africa, in Zanzibar, Mozambique, and the Guineas; then in America, both north and south, and Australia. In later times during the closing years of the 18th century, was established the first English-speaking branch of the Augustinians in the United States, where, in 1796, a house of that brotherhood was opened in Philadelphia, by two members of Irish blood,—Dr. Matthew Carr and John Rosseter,—the latter said to have been formerly an officer under Rochambeau. They are the calced communities. Here their aim chiefly has been mission work among the faithful in pulpit and school. Offshoots from Philadelphia, now thriving in the United States as well as in Cuba and the Philippines are some 20 convents and houses of the order, as mission-centres, with 113 members in residence or in study-houses in Europe. Seventy-five are priests, actively engaged in two colleges, one of them in Havana, 1 academy, 10 parish-schools, besides the congregations of 29 parishes. Furthermore attached to every central establishment the Augustinians have charge of various guilds, or societies, devoted to such aims as religion, social improvement, beneficence in the promotion of good works in the several fields of charity, patriotism, letters, and science.

THOMAS C. MIDDLETON, O. S. A.

Augus'tulus, Romulus, the son of Orestes, a general of the Roman emperor Julius Nepos. Orestes deposed the emperor, and placed his son upon the throne, in 475. In the following year Odoacer, a commander of the German forces in

the Roman service, revolted, put Orestes to death, obliged Augustulus to resign, and thus put an end to the Roman empire in the West. The emperor's name was originally Romulus Augustus, but the Romans changed the latter into the diminutive form Augustulus, out of contempt for his character.

Augus'tus, Caius Julius Cæsar Octavianus, originally called CAIUS OCTAVIUS, the celebrated Roman emperor: b. 23 Sept. 63 B.C.; d. Nola, 19 Aug. 14 A.D. He was the son of Caius Octavius and Atia, a daughter of Julia, the sister of Julius Cæsar. The Octavian family originated at Velitræ, in the country of the Volscians. The father of Octavius had risen to the rank of senator, and had gone to Macedonia, after being chosen prætor, where he was a civil and military officer. Octavius lost his father when young, but was carefully brought up by his mother and L. Marcius Philippus, the second husband of Atia. His talents gained him the regard of his great-uncle, Julius Cæsar, who declared himself willing to adopt him for his son, in case he himself should remain without children. Octavius was studying under the renowned orator Apollodorus, when he received the news of the tragical death of his uncle, and of his having adopted him as his son. Notwithstanding the anxiety of his friends, he went to Italy, and on landing at Brundisium, deputies from the veterans collected there came to him. Conducted in triumph to the city, and saluted as the heir and avenger of Cæsar, he made his adoption publicly known, and took the name of his uncle, adding to it that of Octavianus. He then advanced to Rome, where there were now two parties, that of the republicans, who had killed Cæsar, and that of Antony and Lepidus, who, under the pretense of avenging him, strove to establish their own authority. Octavianus addressed himself first to Cicero, at Cumæ, being desirous to gain over this great orator, and from thence he went to Rome, where the greater part of the magistrates, soldiers, and citizens came to meet him, Antony alone paying no attention to his return. After Octavianus had caused his adoption to be confirmed in the most solemn manner, he went to Antony, and demanded of him the inheritance left him, in order to pay the legacies mentioned in his uncle's will. Antony at first haughtily refused to acknowledge his claims, but changed his attitude when he found the influence of Octavianus continually increasing, and his own proportionably diminishing. There could be no real union, however, between two equally ambitious rivals. In their hearts they cherished reciprocal hatred and jealousy; and their enmity was so little a secret that Octavianus was accused of having wished to get Antony murdered. He afterward, when Antony, together with Lepidus, entered Italy at the head of a powerful army, united with him, and a triumvirate was formed by the three generals, who defeated the republican army under Brutus and Cassius, at Philippi in Macedonia (42 B.C.). After his return to Rome he satisfied the demands of his soldiers by dividing among them confiscated lands. This division caused great disturbances. In the midst of the stormy scenes which convulsed Italy, he was obliged to contend with Fulvia, whose daughter, Clodia, he had rejected, and with Lucius, the brother-in-law of

AUGUSTUS

Antony. After several battles, Lucius threw himself into the city of Perugia, where he was soon after obliged to surrender. The city was given up to be plundered, and 300 senators were condemned to death. After the return of Antony, an end was put to the proscriptions. Octavianus allowed such of the proscribed persons as had escaped death by flight, and whom he no longer feared, to return. There were still some disturbances in Gaul, and the naval war with Sextus Pompeius continued for several years. By a skilful course of conduct he brought about the defeat of Pompeius and reduced Lepidus to a nullity, thus leaving Antony alone as his rival. The empire was now divided between him and Antony; but while the former, in the East, gave himself up to a life of luxury, the young Octavianus pursued his plan of making himself sole master of the world. He especially strove to obtain the love of the people. He displayed mildness and magnanimity, without the appearance of striving after the highest power, and declared himself ready to lay down his power when Antony should return from the war against the Parthians. He appeared rather to permit than to wish himself to be appointed perpetual tribune—an office which gave him supreme power. The more he advanced in the affections of the people, the more openly did he declare himself against Antony.

By making public a will, wherein his rival appointed his sons by Cleopatra his heirs, he stirred up the ill-will of the Romans against him. Availing himself of this feeling, Octavianus declared war against the queen of Egypt, and led a considerable force, both by sea and land, to the Ambracian Gulf. Here his admiral Vip-sanius Agrippa gained the naval victory of Actium (q.v.), which made Octavianus master of the world, 31 B.C. He pursued his rival to Egypt, and ended the war, after rejecting the proposal of Antony to decide their differences by a personal combat. Cleopatra and Antony having killed themselves, Octavianus caused them to be buried with imposing ceremonies. A son of Antony and Fulvia was sacrificed to ensure his safety, and Cæsarion, a son of Cæsar and Cleopatra, shared the same fate. All the other relations of Antony remained uninjured, and Octavianus, on the whole, used his power with moderation. He spent two years in the East, in order to arrange the affairs of Egypt, Greece, Syria, Asia Minor, and the islands. On his return to Rome he celebrated a triumph for three days in succession, and (29 B.C.) closed the temple of Janus—for the third time since the foundation of Rome. Freed from his rivals and enemies, and master of the world, he is said to have been undecided as to how he should exercise his power, or whether he should even retain it. He first set about correcting the abuses which had prevailed during the civil war, established a general peace, ejected unworthy members from the Senate, restored ruined temples, and built new ones.

At the end of his seventh consulship, he entered the Senate house, and declared his resolution to lay down his power. The Senate, astonished at his moderation, besought him to retain it. He yielded to their pressing entreaties, and continued to govern through them. He now obtained the surname of Augustus, which marked the dignity of his person and rank, and united, by degrees, in himself, the offices of imperator,

or commander-in-chief by sea and land, with power to make war and peace; of proconsul over all the provinces; of perpetual tribune of the people, which rendered his person inviolable, and gave him the power of interrupting public proceedings; and, in fine, of censor, and pontifex maximus, or controller of all religious matters. The laws themselves were subject to him, and the observance of them depended upon his will. It was the spirit of his policy to retain old names and forms, but he steadfastly refused to assume the title of dictator, which latterly had become especially odious. He conducted many wars in Africa, Asia, and particularly in Gaul and Spain, where he triumphed over the Cantabrians after a severe struggle. His arms subjected Aquitania, Pannonia, Dalmatia, and Illyria, and held the Dacians, Numidians, and Ethiopians in check. He concluded a treaty with the Parthians, by which they gave up Armenia, and restored the eagles taken from Crassus and Antony. At the foot of the Alps he erected monuments of his triumphs over the mountaineers, the proud remains of which are yet to be seen at Susa and Aosta. After he had established peace throughout the empire, he again closed the temple of Janus. But this peace was interrupted, 9 A.D., by the defeat of Varus, who lost three legions in an engagement with the Germans, under Arminius, and killed himself in despair. The information of this misfortune greatly agitated Augustus. He let his beard and hair grow, and often cried out in the deepest grief, "O Varus, restore me my legions!" Meanwhile the Germans were held in check by Tiberius. During the peace, Augustus had issued many useful decrees, and abolished abuses in the government. He gave a new form to the Senate, employed himself in improving the manners of the people, particularly by promoting marriage, enacted laws for the suppression of luxury, introduced discipline into the armies, and order into the games of the circus. He adorned Rome in such a manner that it was truly said, "He found it of brick, and left it of marble." He made journeys, as Velleius says, everywhere, to increase the blessings of peace; he went to Sicily and Greece, Asia Minor, Syria, Gaul, etc.; in several places he founded cities and colonies. The people erected altars to him, and, by a decree of the Senate, the month Sextilis was called August. The debauchery of his daughter Julia gave him great pain, and he showed himself more severe against those who destroyed the honor of his family, than against those who threatened his life. History says that, in his old age, he was ruled by his wife Livia, the only person, perhaps, whom he truly loved. He had no sons, and lost by death his sister's son, Marcellus, and his daughter's sons, Caius and Lucius, whom he had appointed his successors. Also, Drusus, his son-in-law, whom he loved, died early; and Tiberius, the brother of the latter, whom he hated, on account of his bad qualities, alone survived.

These numerous calamities, together with his continually increasing infirmities, gave him a strong desire of repose. He undertook a journey to Campania, from whose purer air he hoped for relief; but disease fixed upon him, and he died, in the 79th year of his age, and 45th of his reign. When he felt his death approaching he is said to have called for a mirror, arranged his hair, and demanded of the by-standers,

AUGUSTUS—AUK

"Have I played my part well?" and, an answer being returned in the affirmative, "Then," added he, using the form of the players, "farewell, and applaud" (*valet, et plaudite*). If this last passage in the life of Augustus is true, it is certainly indicative of his character, his policy, and even of his fortune. He conquered Brutus by means of Antony, and Antony by means of Agrippa. He several times changed his party, but never his purposes, and knew how to cause power to be offered, and pressed upon him, while it was, in fact, the object of all his exertions. It cannot be denied that he used his power with wisdom, and became the benefactor of his country, which he had previously plunged into the horrors of civil war. His taste and active mind led him to favor and protect the learned; and he even exercised the art of the poet himself; so that he was not unworthy of giving his name to an age distinguished for intellectual creations. His death plunged the empire into the greatest grief. He was numbered among the gods, and temples and altars were erected to him. See Gardthausen, 'Augustus und seine Zeit' (1891); Schuckburg, 'Augustus' (1903).

Augustus I., elector of Saxony: b. 1526; d. 1586. During a peaceful reign, he greatly beautified Dresden, his capital, and built the palace of Augustenburg.

Augustus II., Frederick, elector of Saxony and king of Poland, second son of John George III., elector of Saxony: b. Dresden, 1670; d. 1 Feb. 1733. He was noted for his activity. In 1695 he became elector and in 1696 was candidate for the vacant Polish throne. The French ambassador and the nobles supported the Prince of Conti, but Augustus by acceptance of the Roman Catholic faith, by bribery and intimidation secured the election, 27 June 1697. Early in his reign, a treaty was made between Denmark, Poland, and Russia against Charles XII. of Sweden, for the conquest of Livonia. But Charles, after having defeated the Danes and the Russians, turned toward Poland. Thus began the celebrated Northern war, which lasted 20 years. Charles gained a complete victory, 20 July 1702, and on 1 May 1703, the Saxon army was defeated again at Pultusk. The diet assembled at Warsaw declared Augustus, 14 Feb. 1704, incapable of wearing the crown of Poland, and Stanislaus Lesczinsky, waywode of Posen, was chosen king, 12 July 1704. Charles, victorious on every side, advanced into Saxony, and Augustus found himself obliged to negotiate a secret peace, at Altranstadt, 24 Sept. 1706.

He now devoted himself to the domestic affairs of Saxony. His love of splendor involved him in many expenses, by which the finances of his kingdom were disordered. In 1709, after the defeat of Charles at Pultawa, the Poles recalled Augustus, who united himself anew with Peter the Great. A confederation was now formed in Poland against the Saxon troops, by the party of Stanislaus, in the belief that Augustus was aiming at absolute power. The Saxons were attacked and obliged to surrender. At length, through the mediation of Peter, an arrangement was concluded at Warsaw, 1717, between Augustus and the Polish leaders. The Saxon troops were removed from the kingdom, and Augustus agreed not to maintain more than

17,000 soldiers in Poland, who were to be under the Polish authorities. The last years of his reign were characterized by boundless luxury and corruption of manners. He was not disliked by his subjects, and filled with dignity his station among the European powers. In his character generous ideas were united with despotic feelings, a taste for pleasure with the cares of ambition, and the restlessness of a warlike spirit with the effeminacy of a luxurious life. By his mistresses he had many children. The Countess of Konigsmark bore him the celebrated Maurice of Saxony.

Augustus III., Frederick, elector of Saxony and king of Poland, son of Augustus II: b. Dresden, 1696; d. there 5 Oct. 1763. He succeeded his father as elector in 1733. A part of the Polish nobility chose Augustus king; and in 1736 he was first generally recognized as such by the congress assembled at Warsaw to conclude a peace. Although without the great and amiable qualities of his father, in other respects he closely followed his example, distinguishing himself by the splendor of his feasts and the extravagance of his court. His system of politics consisted in entire dependence upon Russia. He preferred Dresden to Warsaw, and through his long absence from Poland the government sank into entire inactivity. When Frederick attacked Saxony itself in 1745, Augustus deserted his capital, and preserved his pictures and porcelain, but lost the archives of the state, which fell into the hands of the victors. By the peace of Dresden, 25 Dec. 1745, he was reinstated in the possession of Saxony, in the next year. In 1756 he saw himself involved anew in a war against Prussia, and fled to Konigstein, and afterward to Poland. His authority in this country had always been inconsiderable, and after the loss of Saxony, became still more insignificant. The accession of Catherine to the Russian throne was a source of disquietude, for she sought to deprive the Saxon princes, who were allies of France, of the Polish thrones. The Peace of Hubertsberg was hardly concluded when Augustus returned from Warsaw to Dresden, where he died. His son, Frederick Christian, succeeded him as elector of Saxony, and Stanislaus Poniatowsky as king of Poland.

Auk, *āk*, a diving sea-fowl of the family *Alcida* found in the northern regions, the term covering guillemots, murre, lomvias, puffins, and others. They are thick-set birds, seldom more than a foot long, which move about with difficulty on land, from the fact that their legs are set very far back, giving them an erect, penguin-like attitude. In color they are dark brown, black, or lead-color above, and white beneath, except in the breeding season, when bright colors and ornamental plumes temporarily appear on the males of some species. The wing-feathers are so short as to be of little service for flight, and the wings are more used as aids in swimming under water, where they pursue fishes with great speed. The bill is much compressed, but in the breeding season, among the puffins, which show the most marked compression of bill at other times, the bills increase in size and develop ornamental appendages which disappear as the moulting season comes on. The most important North Atlantic auks are the now-extinct great auk (*plautus impennis*) which was as large as a goose and within historic times abounded as far south as the Hebrides

AULD LANG SYNE—AUMONT

(see GAREFOWL); the little auk (*Alle alle*), not larger than a robin and very abundant, sometimes in winter coming as far south as New York and the Great Lakes (see DOVEKIE); and the razor-billed auk (*Alca torda*), which has a bill of remarkable length and sharpness, and which breeds even as far south as the Maine coast. (See MURRELET; PUFFIN, RAZOR-BILL.) The auk lays only a single large egg, which, as no nest is prepared, the parents care for by holding upon the top of their webbed feet and between their thighs. These eggs are a staple food for the natives of the arctic regions, as are the birds, also. They are taken in summer and preserved for winter use, as in the autumn the auks migrate from the frozen coasts and spend the winter in the open spaces of the sea. Consult American and British ornithologies; and Selous, 'Bird Watching' (1901).

Auld Lang Syne, áld lang sin, a song attributed to Burns, who added a couple of stanzas to a poem known to have existed in 1600.

Auld Licht Idylls, áld licht i'dills, a work by James M. Barrie. It is a series of 12 sketches of life in Glen Quharity and Thrums. In all of them the same characters appear.

Auld Ree'kie. See EDINBURGH.

Auld Rob'in Gray, a famous Scottish ballad by Lady Anne Barnard, published anonymously in 1722, but unacknowledged till 1825.

Aulic (Latin, *aula*, a court or hall), a term applied to a council (the *Reichshofrath*) in the old German empire. It was one of the two supreme courts of the German empire, the other being the court of the imperial chamber (*Reichskammergericht*). It had not only concurrent jurisdiction with the latter court, but in many cases exclusive jurisdiction, in all feudal processes, and in criminal affairs, over the immediate feudatories of the emperor and in affairs which concerned the imperial government. The title is now applied in Germany in a general sense to the chief council of any department, political, administrative, judicial, or military.

Aulich, ow'lih, Ludwig, Hungarian general: b. Presburg, 1792, d. Arad, 6 Oct. 1849. After the evacuation of Pesth by the imperial troops in 1849, Aulich made his triumphant entry into that capital, and was received with enthusiasm by the people. In his famous proclamation of Godollo, Kossuth paid also an appropriate homage to Aulich's gallantry. Subsequently, when Gorgey was forced to renounce either the army or the ministry of war, he took the latter alternative, and Aulich was appointed his successor. But although he might have used his authority as minister of war to frustrate Gorgey's negotiations with the Russians, he actually assisted Gorgey to bring these negotiations to a successful close. He was then delivered over to Austria by the Russians, and, in company with 12 others, perished on the gallows.

Aulis, in ancient Greece, a seaport in Boeotia, on the strait called Euripus, between Boeotia and Euboea, noted chiefly for its temple of Artemis, and as the scene of the sacrifice of Iphigenia.

Aullagas, owl-lá'gas, a salt lake in Bolivia, which receives the surplus waters of Lake Titicaca through the Rio Desaguadero, and has

only one perceptible, insignificant outlet. The disposition of its superfluous water is, therefore, still a matter of uncertainty.

Aulularia (from *Aulula*, a pot), a comedy by Plautus. Euclion, an old miser, is the principal character.

Aumale, ô-mal', Henri Eugène Philippe Louis d'Orleans, Duke of, 4th son of king Louis Philippe b. Paris, 16 Jan. 1822; d. 7 May 1897. He entered the military service at the age of 17, and distinguished himself by his bravery. At the age of 20, he was promoted to the rank of brigadier-general, and was sent to Algeria, in October 1842. Intrusted with the command of the district of Medeah, he attacked the smala of Abd el Kader with such impetuosity that in less than two hours the emir's troops were entirely routed. As a reward, Aumale was made lieutenant-general and commander of the province of Constantine. In 1847, the young prince, but 25 years old, was intrusted with the general governorship of Algeria, which was taken from the hands of Marshal Bugeaud. This appointment was not approved either by the army or the French nation, and it was the occasion for loud complaints against the ambition of the king, who was concentrating the direction of the whole military service in the hands of his sons. After the revolution of 1848, he went to England, where he devoted his attention to literary pursuits. His latest years were passed in Sicily. He wrote 'Les Institutions Militaires de la France' (1867); 'Histoire des Princes Conde' (1869).

Aumale, a town in France, 35 miles north-east of Rouen, which has given titles to several notables in French history: Jean d'Arcourt, Eighth Count d'Aumale, fought at Agincourt, and defeated the English at Gravelle (1423). Claude II., Duc d'Aumale, one of the chief instigators of the Massacre of St. Bartholomew, was killed 1573. Charles de Lorraine, Duc d'Aumale, was an ardent partisan of the League in the politico-religious French wars of the 16th century. Pop (1900) 2,219.

Aumont, ô-môn', the name of one of the great historical families of France. The first Aumont mentioned in history is JEAN III., SIRE d'AUMONT, who, in 1328, took part in the battle of Cassel, and served under Philip de Valois, on many other important occasions. A more distinguished member of the family was JEAN d'AUMONT: b. 1522; d. 1595. He was on the battlefield almost from his cradle to his grave, and served under six kings: Francis I., Henry II., Francis II., Charles IX., Henry III., and Henry IV. ANTOINE d'AUMONT: b. 1601; d. 1669; served with distinction under Louis XIV., and in 1662 was appointed governor of Paris. LOUIS MARIE VICTOR d'AUMONT and DE ROCHEBARON: b. 1632; d. 1704; took an active part in the war in Flanders under Louis XIV. was governor of Boulogne and the Boulonnais, and member of the academy of inscriptions and belles-lettres. JACQUES, DUC d'AUMONT: b. 1732; d. 1799; was the commandant of the national guard, on 5 Oct. 1789, when Louis XVI. was forcibly taken away from Versailles. LOUIS MARIE CÉLÈSTE DE VIENNE, DUC d'AUMONT: b. 1762; d. 1831; served in Germany, Spain, and Sweden, until the restoration, when he was appointed lieutenant-general. He made

AUNGERVILLE—AURELIUS ANTONINUS

himself very useful to the cause of royalty in suppressing the troubles in Normandy, and in 1815 was created peer of France, and raised to the office of first chamberlain. He was one of the most prominent men at the courts of Louis XVIII. and Charles X., but he exchanged politics for theatres, and became the chief director of the comic opera.

Aungerville, ân'ger-vîl, **Richard**, known as **RICHARD DE BURY** (from his birthplace, Bury St. Edmunds), an English statesman, bibliographer, and correspondent of Petrarch: b. 1281; d. 1345. He entered the order of Benedictine monks, and became tutor to the Prince of Wales, afterward Edward III. Promoted to several offices of dignity, he ultimately became Bishop of Durham, and Lord Chancellor of England. He made the acquaintance of many of the eminent men of the day, and was a diligent collector of books. He was the author of 'Philobiblon,' 'Epistolæ Familiarium,' including letters to Petrarch, etc.

Aura. See **EPILEPSY**.

Au'ramine. See **COAL TAR COLORS**.

Aurangabad, ow-rûn'ga-bad', a town in India; 175 miles from Bombay, and on the Kaum River, a small tributary of the Godavery. It is surrounded by walls with semicircular towers at the different angles, and contains a ruined palace of Aurengzebe and a mausoleum erected to the memory of his favorite wife. A mile to the west of the town are cantonments for cavalry, infantry, and artillery. Aurangabad was founded early in the 17th century, and rose to be a considerable trading centre, but its commercial importance decreased when Hyderabad became the capital of the Nizam. In late years the trade has revived considerably, and embraces wheat, cotton, and manufactured goods. Pop. (1891) 33,887.

Auran'tia. See **COAL TAR COLORS**.

Au'rates. See **AURIC ACID**.

Aurbacher, ow'r'ba-her, **Ludwig**, German author: b. 1784; d. 1847; well remembered by his 'Volksbuchlein' (1827-9); a collection of popular tales, ranking among the best productions of this kind in German literature.

Aure'lia. See **JELLYFISH**.

Aure'lian, **Lucius Domitius Aurelianus**, one of the later emperors of Rome: b. about 212; d. 275. He was the son of a peasant of Illyricum, and rose to the highest rank in the army, and even to the consulate; which good fortune was increased by a wealthy marriage. Claudius II., on his death-bed, in 270, recommended Aurelian to the choice of the troops of Illyricum, who readily acceded to his wishes. He delivered Italy from the barbarians, reduced Tetricus, who had been unwillingly made to assume the purple in Gaul, and conquered the famous Zenobia, queen of Palmyra. Aurelian followed up his victories by the reformation of abuses, and the restoration throughout the empire of order and regularity, but tarnished his good intentions by the general severity of his measures, and the sacrifice of the senatorian order to his slightest suspicions. He had planned a great expedition against Persia, and was waiting in Thrace for an opportunity to cross the straits, when he lost his life by assassination, the result of a conspiracy ex-

cited by a secretary whom he intended to call to account for peculation. Aurelian was a wise, able, and active prince, and well deserved the title given him by the Senate of "Restorer of the Roman Empire."

Aure'lian, a historical novel by William Ware, an American author born in 1797. It was first published in 1838 under the title 'Probus,' and was a sequel to 'Letters of Lucius M. Piso,' published the year before; and like that novel, written in the form of letters. The full title is 'Aurelian; or, Rome in the Third Century. In Letters of Lucius M. Piso, from Rome, to Fausta, the daughter of Gracchus at Palmyra.' The novel presents a singularly faithful picture of the Rome of the second half of the 3d century.

Aure'lian Wall, a wall around Rome, built mostly by the emperor Aurelian, but completed in the reign of Probus. It was almost 12 miles long, and 54 feet high, enclosing an area of 5,000 square miles, and marking the boundaries of Rome in the time of Aurelian. The wall was built in great haste as a defense against the barbarians, and includes the remains of house- and garden-walls. It was fairly well preserved until recently, but is now rapidly falling to decay.

Aure'lius Antoninus, Marcus, often called simply **MARCUS AURELIUS**, a distinguished Roman, and according to Canon Farrar, "the noblest of pagan emperors" b. Rome, 29 April 121 A.D.; d. Vindobona,—the modern Vienna—17 March 180 A.D. He was descended from an illustrious line which tradition declared extended to the good Numa, the second king of Rome. In the descendant Marcus were certainly to be found, with a great increment of many centuries of noble life, all the virtues of his illustrious ancestor. Doubtless the cruel persecutions of the infamous emperors who preceded Hadrian account for the fact that the ancestors of Aurelius left the imperial city and found safety in Hispania Bætica, where in a town called Succubo,—not far from the present city of Cordova—the emperor's great-grandfather, Annianus Verus, was born. From Spain also came the family of the emperor Hadrian, who was an intimate friend of Annianus Verus. The death of the father of Marcus Aurelius when the lad was of tender years led to his adoption by his grandfather and subsequently by Antoninus Pius. By Antoninus he was subsequently named as joint heir to the imperial dignity with Commodus, the son of Ælius Cæsar, who had previously been adopted by Hadrian. From his earliest youth Marcus was distinguished for his sincerity and truthfulness. "Hadrian's bad and sinful habits left him," says Niebuhr, "when he gazed on the sweetness of that innocent child. Punning on the boy's paternal name of Verus, he called him Verissimus, 'the most true.'" Among the many statues of Marcus extant is one representing him at the tender age of eight years offering sacrifice. He was even then a priest of Mars. It was the hand of Marcus alone that threw the crown so carefully and skilfully that it invariably alighted upon the head of the statue of the god. The entire ritual he knew by heart. The great emperor Antoninus Pius lived in the most simple and unostentatious manner; yet even this did not satisfy the exacting, lofty spirit of Marcus. At 12 years

AURELIUS ANTONINUS

of age he began to practise all the austerities of Stoicism and became a veritable ascetic. He ate most sparingly; slept little, and when he did so it was upon a bed of boards. Only the repeated entreaties of his mother induced him to spread a few skins upon his couch. His health was seriously affected for a time; and it was, perhaps, to this extreme privation that his subsequent feebleness was largely due. His education was of the highest order of excellence. His tutors, like Nero's, were the most distinguished teachers of the age; but unlike Nero, the lad was in every way worthy of his instructors. His letters to his dearly beloved teacher, Fronto, are still extant, and in a very striking and charming way they illustrate the extreme simplicity of life in the imperial household in the villa of Antoninus Pius at Lorum by the sea. They also indicate the lad's deep devotion to his studies and the sincerity of his love for his relatives and friends. When his predecessor and adoptive father Antoninus felt the approach of death, he gave to the tribune who asked him for the watchword for the night the reply "Equanimity," directed that the golden statue of 'Fortune' that always stood in the emperor's chamber be transferred to that of Marcus Aurelius, and then turned his face and passed away as peacefully as if he had fallen asleep. The watchword of the father became the life-world of the son, who pronounced upon that fether in the 'Meditations,' one of the noblest eulogies ever written. It would be impossible here to detail even briefly all the manifold public services rendered by Marcus Aurelius to the empire during his reign of 20 years. Among his good works were these: the establishment, upon eternal foundation, of the noble fabric of the civil law—the prototype and basis of Justinian's task; the founding of schools for the education of poor children; the endowment of hospitals and homes for orphans of both sexes; the creation of trust companies to receive and distribute legacies and endowments; the just government of the provinces; the complete reform of the system of collecting taxes; the abolition of the cruelty of the criminal laws and the mitigation of sentences unnecessarily severe; the regulation of gladiatorial exhibitions; the diminution of the absolute power possessed by fathers over their children and of masters over their slaves; the admission of women to equal rights to succession to property from their children; the rigid suppression of spies and informers; and the adoption of the principle that merit, as distinguished from rank or political friendship, alone justified promotion in the public service. But the greatest reform was the reform in the imperial dignity itself, as exemplified in the life and character of the emperor. It is this fact which gives to the 'Meditations' their distinctive value. The infinite charm, the tenderness, and sweetness of their moral teachings, and their broad humanity, are chiefly noteworthy because the emperor himself practised in his daily life the principles of which he speaks, and because tenderness and sweetness, patience and pity, suffused his daily conduct and permeated his actions. The horrible cruelties of the reigns of Nero and Domitian seemed only awful dreams under the benignant rule of Marcus Aurelius. It is not surprising that the deification of a deceased emperor, usually regarded by senate and people

as a hollow mockery, became a veritable fact upon the death of Marcus Aurelius. He was not regarded in any sense as mortal. All men said he had but returned to his heavenly place among the immortal gods. As his body passed, in the pomp of an imperial funeral, to its last resting-place, the tomb of Hadrian,—the modern Castle of St. Angelo at Rome,—thousands invoked the divine blessing of Antoninus. His memory was sacredly cherished. His portrait was preserved as an inspiration in innumerable homes. His statue was almost universally given an honored place among the household gods. And all this continued during successive generations of men. Marcus Aurelius has been censured for two acts: the first, the massacre of the Christians which took place during his reign; the second, the selection of his son, Commodus, as his successor. In extenuation of his persecution of the followers of Christianity, it has been alleged in his behalf that he was deceived by evil counsellors, who misrepresented the conduct of the Christians to him. This excuse impinges upon his wisdom as a ruler and his admittedly wide knowledge of the conditions of the empire. It is further urged that when we take into consideration the environment of the emperor, no just cause for condemnation of his course remains. He imbibed a bitter prejudice against the new religion from his beloved friend and instructor, Fronto. In the writings of Epictetus, whom he greatly revered, he found severe condemnation of the Christians as fanatics. With such a profound natural bias, it is urged, it is no wonder that he was led to regard the new creed with aversion. But the reason of his course is to be found rather in his deep-rooted attachment to the heathen beliefs of his ancestors and of the empire. It was rather his fear that the ancient cult, bound up as it seemed in the character of Roman rule, was seriously menaced by the progress of Christianity, which actuated him to the severe and bloody measures he took to root out a dangerous rival. Regarding Christianity as a 'pernicious sect,' a 'secret conspiracy' against the empire, an 'immoral superstition,' whose poison was eating into the social life, and himself as the conservator of the empire and its traditions, some extenuation might be conceded to such fierce zeal in persecuting the Christians in almost any other emperor that Marcus Aurelius. For there is a glaring inconsistency in his character in the adoption of so cruel and monstrous a course by one who appears otherwise so admirable. In this signal instance he is as bloody and heartless as a Domitian, a Nero or a Caligula; in all other things merciful, in this pitiless; in his general administration, just and humane; in this, singularly unjust and even vindictive. Whatsoever may be urged in his defense, this relentless persecution of the Christians is a dark blot on his fame. Whatever extenuating circumstances may seem to condone it, his policy in this instance was utterly inconsistent with his general character.

His first edict against the Christians was published in 177. Multitudes perished in the fierce persecutions which followed. Notable amongst the victims were St. Polycarp in Smyrna and St. Caecilia at Rome. The manner in which they were tortured before being relieved from sufferings by death was more befitting a savage chief than a civilized ruler.

AURELIUS—AURORA

Of the appointment of Commodus as his successor, it may be said that the paternal heart hoped against hope for filial excellence. Marcus Aurelius believed, as clearly appears from many passages in the 'Meditations,' that men did not do evil willingly, but through ignorance; and that when the exceeding beauty of goodness had been fully disclosed to them, the depravity of evil conduct would appear no less clearly. The emperor who, when the head of his rebellious general was brought to him, grieved because that general had not lived to be forgiven; the ruler who burned unread all treasonable correspondence, would not, nay, could not believe in the existence of such an inhuman monster as Commodus proved himself to be. The appointment of Commodus was a calamity of the most terrific character; but it testified in trumpet tones to the nobility of the emperor's heart, the sincerity of his own belief in the triumph of right and justice. See FARRAR, 'Seekers after God' (1868); RENAN, 'Marc Aurèle' (1881); PATER, 'Marius the Epicurean.'

Aurelius, Victor Sextus, Roman historian of the 4th century whose 'De Cæsantres' is a collection of biographical sketches of the emperors from Augustus to Constantine.

Aurengzebe, â'rang-zéb'. See AURUNGZEBE.

Aureole, or **Aureole**, in paintings, an illumination surrounding a holy person, as Christ, a saint, or a martyr, intended to represent a luminous cloud or haze emanating from him. It is generally of an oval shape, but may be nearly or quite circular, and differs from the nimbus surrounding the heads of sacred personages in being an emanation of light from the whole body.

Aureosin. See COAL TAR COLORS.

Aureus, â're-üs, or **Aureus Nummus**, the earliest gold coin of Rome, coined 207 B.C., in the second Punic war. It weighed 2 denarii, and 1 quinarius, and was worth 25 denarii, or 100 sesterces. In later times it was called *solidus*, but had diminished in value.

Auric Acid. Trioxid of gold, Au_2O_3 , does not combine with acids to form salts, but a hydrated form of the oxid, $Au_2O_3 \cdot H_2O$, is known, which unites with bases to form salts. From this acid-like property, the hydrated oxid has been called "auric acid." Compounds of auric acid with bases are called "aurates." Aurate of potassium, $Au_2O_3 \cdot K_2O \cdot 3H_2O$, is a crystalline substance, readily dissolving in water with the formation of an alkaline solution. When digested with ammonium sulphate, auric acid yields an aurate of ammonia of undetermined composition, called "fulminating gold." This substance is yellowish-brown in color, when in the solid form, and decomposes explosively upon percussion, or when heated to 212° F.

Aurichalcite (-kal'-), a native basic carbonate of copper and zinc, usually occurring in beautiful bright blue or green, pearly incrustations, composed of ill-defined monoclinic (?) crystals or scales. Its hardness is 2, and its specific gravity about 3.6. It has been found in Greece, Italy, England and various other European countries, and in fine specimens at Morenci in Arizona, Magdalena in New Mexico, in Colorado, Montana, Utah and elsewhere.

Auricle. See EAR.

Auricles of the Heart. See HEART; CIRCULATION.

Auricula, a hardy perennial herb, *Primula auricula*, of the natural order *Primulaceae*, found in the mountainous parts of central Europe. The wild plant has an umbel of small yellow flowers on a short stalk, which rises from a set of radial leaves. By selection a very large number of varieties have been produced. These have long stalks and very diversely colored, fragrant large flowers, for which the plant is widely cultivated in Europe. Since the climate of the United States is hot and dry, the plant is almost confined to greenhouses. It is propagated by means of seeds and offsets, and succeeds best on rich, light, loamy soil.

Auricular Confession. See CONFESSION; PENANCE; SACRAMENTS.

Aurifa'ber, the Latinized name of JOHANN GOLDSCHMIDT, one of Luther's friends: b. 1519; d. Erfurt, 1579. He became pastor at Erfurt in 1566. He collected the unpublished manuscripts of Luther, and edited the 'Epistolæ' and the 'Table-Talk.'

Auri'ga, in astronomy, the Wagoner, a constellation of the northern hemisphere, containing 68 stars, including Capella, a star of the first magnitude.

Aurillac, ô're-yak', a town of France, 272 miles south of Paris. It is noted for its ancient buildings, among which are the Church of Notre Dame, constructed in the 13th century, and the castle of St. Stephen. It has manufactures of jewelry, copper, kettles, paper, woolen stuffs, and carpets. Pop. (1896) 13,531.

Au'rin, **Au'rine**, a trade name for impure rosolic acid (q.v.).

Au'ringer, **Obadiah Cyrus**, American poet: b. Glens Falls, N. Y., 4 June 1849. He served for some years in the United States navy. In 1875 he became a farmer in his native place. Among his works are: 'Voices of a Shell,' 'Scythe and Sword' (1887); 'Episode of Jane McCrea'; and 'The Book of the Hills.'

Aurochs, ä'röks, the European bison (*Bos bonasus*, or *Bison europæus*) called by the Germans "wisent" and in the Slavonic languages "zubr" or "suber." This great bison stands six feet or more in height at the shoulder, and closely resembles the American bison or "buffalo" (q.v.); it is believed, indeed, that the American animal descended from the ancestral race of aurochs. When the Romans spread northward into Europe they found these and other oxen in the forests wherever they went, and even down to the days of Charlemagne they were spread over Germany and were beasts of chase. They have steadily diminished, however, until now they exist only as a single herd in the royal forest-preserves of Bielovege, in Lithuania, which in 1899 numbered 700, while a few hundred roam in the Caucasian Mountains. See BISON.

Aurora, Ill., city, Kane County; on Fox River, and on the Chicago, B. & Q., the Chicago & N. W., the Elgin, J. & E., and the Illinois, I. & M. R.R.'s. It was founded in 1834 by Joseph and Samuel McCarty; was organized as a village in 1857, and was incorporated as a city in 1887. It is an important manufacturing city, having a variety of extensive establishments; these include the shops of the Chicago, Burling-

AURORA—AURORA BOREALIS.

ton & Quincy Railroad, cotton mills, a wheel-scraper manufactory, carriage and wagon factories, smelting-works, and foundries and machine shops. There are five national banks with a combined capital of \$600,000, and a State bank. There are 38 churches, a good system of public schools including two high schools, the East Aurora High School and the West Aurora High School, the latter established in 1870; and a public library, a building for which was presented by Andrew Carnegie. It is also the seat of Aurora Business College and of the Jennings Seminary for young women. The government is vested in a mayor and a city council of 14, seven of which are elected each year for a term of two years; the city officials are elected by the people. The waterworks and the electric light plant are owned and operated by the city. Pop. (1890) 19,688; (1900) 24,147; (1904; estimated) 28,000.

Auro'ra, Ind., town in Dearborn County, on the Ohio River; C., C., C. & St. L., and the Ohio and Miss. R.R.'s. It has regular steamboat connection with Cincinnati. There are extensive car shops here, and a large grain and hay trade. Pop. (1900) 3,645.

Auro'ra, Mo., a city in Lawrence County, situated on the Kansas City, Fort Scott, and Memphis R.R.'s., about 18 miles northwest of Pierre City. The chief industries are fruit growing, lead and zinc mining, and farming. There are also flour mills, foundries, and machine shops. Aurora has two banks with \$75,000 capital. Pop. (1900) 6,191.

Auro'ra, N. Y., a village in Cayuga County, situated on Cayuga Lake; 25 miles northwest of Ithaca; on the Lehigh Valley R.R. It is the centre of an agricultural region, and is a residential town and excellent summer resort. It is the seat of Wells College for Women. Pop. (1900) about 1,000.

Auro'ra (Greek, *Eōs*), in mythology, daughter of Hyperion and Theia, and sister of Helios and Selene. She is goddess of the dawn; rises from the ocean, drawn by the celestial horses, Lampus and Phæthon, and with rosy fingers raises the veil of night, shedding light upon the world.

Auro'ra, a famous painting by Guido Reni, on the ceiling of the Casino Rospigliosi in Rome.

Auro'ra Bo'rea'lis (French, *aurora boréale*; German, *Nordlicht*), the northern light. An illumination in the sky, seen oftenest north of middle latitudes in the northern hemisphere, and south of them in the southern hemisphere. In our hemisphere it is generally visible in the north, and has, therefore, been called the Aurora Borealis. In the southern hemisphere it is called the Aurora Australis.

The frequency with which it is seen varies with the latitude of the place. It is comparatively rare within 45° of the equator, but becomes more frequent toward the north up to the latitudes of about 60°, where it sometimes becomes almost a nightly occurrence. Nearer the pole it again becomes less frequent. We shall first describe it as it is commonly seen in our own latitudes. The first noticeable phenomena commonly occurs after the end of twilight, when the northern sky near the horizon will be seen illuminated with a light somewhat like that of the dawn. Careful examination will show, how-

ever, that the illumination is in the form of a broad arch, highest near the magnetic north, and reaching the horizon in the northeast and northwest directions. Presently beams of light are seen crossing this arch with a quivering or flickering motion, and shooting toward the zenith. Each beam constantly varies in brightness and seemingly fades away to give place to another.

In more northern latitudes, say north of 45° or 50°, these beams form the most brilliant feature of the aurora. Sometimes they are arranged in curved, wavy lines like the slats of a window shade flying in the wind, giving the appearance of a scroll in the process of being unrolled. In the case of a very brilliant aurora the beams may cover almost or quite the entire sky. In this case they will be seen to converge toward a point commonly not far from the zenith. The appearance presented by the beams grows out of the direction in which they are seen and to the laws of perspective. Long-repeated observations show that the rays are really parallel to the direction of the dipping needle, or to the lines of the earth's magnetic force. In the latitudes which we have mentioned, the dip is commonly more than 60°, increasing to 90° at the magnetic pole; hence when a great number of beams, all parallel to each other, are viewed from a point on the earth's surface under the region in which they are found, they all seem to converge according to the laws of perspective, toward that part of the sky to which the upper (south) pole of a dipping needle is directed. If the parallelism to the magnetic lines is exact, the direction of this point should be the same as that of the compass needle itself. It is still an open question where the parallelism is exact. Many observations seem to show a deviation of 10° or more, but the determination of the exact centre of convergence is difficult unless the rays are so numerous as to cover a large part of the sky, and it is not certain that the deviation may not be due to errors of estimation.

The Nature of the Auroral Light.—As a general, perhaps universal, rule, the rays or beams which we have described have a slightly yellowish tinge. When their light is analyzed with the spectroscope, several lines, sometimes as many as 12, are found in the spectrum. Of these the brightest and most constant is in the yellowish green part of the spectrum, having a wave length of 557. This line is characteristic of the aurora, but has not been identified with that emitted by any known substance.

The light of an aurora does not proceed wholly from the beams. Very irregular sheets of light, having the appearance of thin luminous clouds, are often seen. These are of various colors, red being especially frequent. The appearance is then that of a red cloud illuminated by the rays of the sun sometime after the latter has set. The light can, however be easily distinguished from that of a cloud by its diffused character and the absence of any definite outline. The height of the region in which the auroras are formed has never been definitely determined. The most important question is, whether the height is, in any case, above the upper limit of the atmosphere. This question is all the more difficult in that this limit is in itself an uncertain quantity. Observations of shooting

AURORA LEIGH—AUSABLE CHASM

stars show that these objects become visible at a height of about 100 miles above the earth's surface. The limit of the atmosphere must therefore be as high as this, and may be much higher. The difficulty of making observations upon the same auroral beams, at one moment, at different points of the region from which they are visible, is such that no exact determination of the height of a beam has ever been made. There is some reason to believe that the height may range from 100 to 150 miles, but there is no reason to believe that a beam is ever seen above the possible limit of the atmosphere.

The lower limit of the aurora is undetermined. Observers have sometimes been supposed to see a beam between their own position and a mountain or other terrestrial object, but this was probably one of those optical illusions from which even the best observers can scarcely free themselves. It is also very frequently believed in countries where auroras are numerous that the phenomenon is accompanied by a crackling sound, somewhat resembling the rustling of silk or straw. As these sounds have been more difficult to hear, the more accurate and well-trained the ear of the observer, the presumption is that they are entirely illusory. It is a well-known psychological fact that when a phenomenon is seen which is commonly associated with sound, many people fancy that the latter is heard even in cases where it is manifestly impossible. A familiar instance of this sort is the rocket-like sound which many persons fancy to accompany the passage of a brilliant meteor through the air. Apart from the fact that such a sound could not possibly have come from the meteor, we have the fact that only untrained observers ever hear these sounds.

Cause of the Aurora.—Science has not been able to as yet determine with certainty and precision the cause of this very common phenomenon. When the luminous effect produced by the passage of electricity through the highly rarefied air of a vacuum tube was first observed, its resemblance to the aurora led to the view that the latter was produced by electric currents in the upper regions of the atmosphere. Although it is not impossible that such currents may be associated with the aurora, they do not adequately explain its light, and are apparently inadequate to explain its rays. Yet there is no doubt that the aurora is associated in some way with the magnetism of the earth. The coincidence of the rays of the aurora with the direction of the magnetic needle is one proof of this relation; another proof is found in the relation of the aurora to magnetic storms. The general rule is, that a very brilliant aurora is associated with such a storm, disturbing the magnetic needle not only at the point where the aurora is visible, but perhaps over the whole earth. Earth currents so strong that from time to time a line of telegraph may be run by them are also occasional accompaniments of a brilliant aurora, but although the intimate connection of the two phenomena is so well established, the exact relationship is yet to be worked out. In recent years Arrhenius has propounded a theory, based on the very probable fact that the sun emits a flood of corpuscles of a nature similar to that of the mysterious rays known as X-rays, cathode rays, electrons, etc., the investiga-

tion of which has occupied so large a place in recent physics. His theory is, that these corpuscles on approaching the earth are acted on in the direction of the lines of its magnetic force round which they describe helices. While nothing as yet has been found to disprove this theory, it is one which still needs much proving. What can be said with reasonable probability is that the aurora is caused by irregular emanations of corpuscles from the sun, which are stopped in the upper regions of our atmosphere.

Periodicity of the Aurora.—Records of auroras extending back two centuries or more show that they have been much more numerous at some period than at others. Sometimes it has been supposed that they have been more numerous at intervals of 33 or some fixed number of years, but this has not yet been proved, nor has any law been determined by which we can definitely say at what times they appear in the greatest number. But several periods are observed which show that the appearance of the aurora is in some way connected with the sun. The first instance of this is the fact that they are more numerous when the spots of the sun are more numerous. As there is an 11-year period in the spots on the sun, so there is a corresponding period in the aurora. There is also a semi-annual period in the frequency of the aurora, the greatest number being observed in March and September and the smallest in June and December. Arrhenius has connected this with the fact that in March and September the earth is over the region of the sun's surface in which spots are more numerous. Statistics also show that there are more auroras in the northern hemisphere when the moon is south of the equator than when she is north. This, however, is not proved to be a general law. There is also an observed period of 25.93 days in the frequency of the aurora. This is so near the time of the sun's rotation that it may be connected with the latter. Consult: Angot, 'The Aurora,' International Scientific Series.

SIMON NEWCOMB, LL.D.

Auro'ra Leigh, lē, a blank verse novel by Mrs. Browning, published 1857. The book discusses various theories for the regeneration of society, and is filled with passages of great beauty, and ethical utterances of a lofty nature.

Aurangzebe, ā'rūng-zēb', the last important emperor of Hindustan, of the Mogul dynasty: b. 22 Oct. 1618; d. Ahmednuggur, 21 Feb. 1707. He was the son of Shah Jehan, and properly named Mohammed, but received from his grandfather that of Aurangzebe (Ornament of the Throne), by which he is known to history. Aurangzebe, in 1658, was crowned sole monarch of the great Mogul empire.

Ausable (ō-sā'b'l) **Chasm**, a picturesque and popular American summer resort, in New York State; 12 miles from Plattsburg, and 1 mile from Keeseville. It is an isolated formation, wholly independent of, and disconnected from, any other similar panorama. At the beginning of the chasm, the river is hemmed into a channel not more than 10 feet wide by walls of rock from 100 to 200 feet high. Lower down the walls gradually spread apart till in some places there is a distance between them of 50 feet, and then extend with sharp turns and occasional enlargements for nearly 2 miles.

AUSCULTATION—AUSTEN

Lateral fissures, narrow, and deep, project from the main ravine at nearly right angles, and through one of these a staircase of over 200 feet reaches to the abyss. The walls are formed of laminae of sandstone, laid in precise and regular order, and their crevices are filled with a thick growth of hardy pines and cedars. The trip through the chasm may be made in a small boat or on foot. For the accommodation of tourists, stone walks with substantial iron railings and firm bridges have been constructed.

Auscultation, a method of examining the body by means of the sounds given to the ear. The naked ear may be used, or instruments, such as the stethoscope (q.v.), or the phoneidoscope be employed. The natural sounds may be alone investigated, as in listening to the breathing sounds, or the heart sounds, or the organ, or that portion contiguous or remote from the organs, may be tapped, or percussed, to determine variations in the resonance. All of the parts of the body may be investigated by these means. Auscultation is probably, next to inspection, the oldest mode of investigation. Hippocrates II. used it extensively, but it was not until Lænnec, in 1816, gave his demonstrations that the method came to be recognized as one of the most important in the diagnosis of diseased conditions. Consult Butler, 'Diagnostics of Internal Medicine' (1901); Sahl, 'Untersuchungsmethoden.' See PERCUSSION.

Auso'nia, a poetical synonym for Italy; so used by Virgil and other Roman poets.

Auso'nus, Decius Magnus, the most distinguished Roman poet of the 4th century A.D. b. Burdigala (Bordeaux) about 310; d. about 392. He studied under several distinguished masters, and became at last professor of rhetoric in his native city, whence his fame extended through the whole empire. Valentinian intrusted to him the education of his son, Gratian, and appointed him afterward quaestor and praetorian prefect. After Gratian had ascended the throne he showed himself not less grateful to his preceptor. About the year 379 he appointed him consul in Gaul. After the death of Gratian, Ausonius lived upon an estate at Bordeaux, devoted to literary pursuits. As Valentinian was of the Christian religion, it is probable that Ausonius was so, too; and many of his writings confirm this conjecture. Critics are not unanimous on the subject of his poetical merits. He is undeniably learned and ingenious, but his style and versification have the blemishes of the age, and his Latin is impure. His epigrams, idyls, eclogues, letters in verse, etc., are extant. The best edition is that of 'Peiper' (1886).

Aus'pices, among the Romans, omens, especially those drawn from the flight or other movements of birds, supposed to be indications of the will of heaven, and to reveal futurity. At first only the augurs took the auspices, but after a time civil officers, discharging important functions had the right of doing so. Two kinds of auspices, however, arose—a greater and a lesser; the former reserved to dictators, consuls, censors, praetors, or the commander-in-chief in war; the latter permitted to less exalted functionaries. The glory of a successful enterprise was universally assigned to the person who took the auspices, and not to the leader of

the enterprise itself; hence, the phrase arose, to carry on a war "under the auspices" of the emperor or some other high authority. See AUGURS.

Aussig, ow'sig, a town in Bohemia, near the junction of the Bila with the Elbe; 42 miles north-northwest of Prague. It has large manufactures of woollens, chemicals, etc. Pop. (1901) 38,407.

Aus'ten, Jane, a celebrated English novelist: b. Steventon, Hampshire, 10 Dec. 1775; d. Winchester, 18 July 1817. Her father was a clergyman of the Established Church, and accomplished enough to fit his boys for the university. Her mother was a clever woman, full of epigram and humor in conversation. From her cradle, she was used to hearing agreeable household talk, and the freest personal criticism on the men and women who made up her small, secluded world. It was in the Steventon rectory in the family room, where she was interrupted 20 times in an hour, that the shrewd and smiling social critic managed, before she was 21, to write her famous 'Pride and Prejudice.' Here, too, 'Sense and Sensibility' was finished in 1797, and 'Northanger Abbey' in 1798. The first of these, submitted to a London publisher, was declined as unavailable, by return of post. The second, the gay and mocking 'Northanger Abbey,' was sold to a Bath bookseller for £10, and several years later bought back again, still unpublished, by one of Miss Austen's brothers. For the third story she seems not even to have sought a publisher. These three books, all written before she was 25, were evidently the employment and delight of her leisure. The serious business of life was that which occupied other pretty girls of her time and her social position—dressing, dancing, flirting, learning a new stitch at the embroidery frame, or a new air on "the instrument"; while all the time she was observing, with those soft, hazel eyes of hers, what honest Nym calls the "humors" of the world about her. In 1801, the family removed to Bath, then the most fashionable watering-place in England.

For a period of eight years, spent in Bath and in Southampton, Miss Austen wrote nothing save some fragments of 'Lady Susan' and 'The Watsons,' neither of them of great importance. In 1809 the lessened household, composed of the mother and her two daughters only, removed to the village of Chawton, on the estate of Mrs. Austen's third son; and here, in a rustic cottage, now become a place of pilgrimage, Jane Austen again took up her pen. She rewrote 'Pride and Prejudice,' 'Sense and Sensibility,' and between February 1811 and August 1816 completed 'Mansfield Park,' 'Emma,' and 'Persuasion.' At Chawton, as at Steventon, she had no study, and her stories were written near a window in the family sitting-room, where she must often have been interrupted by the prototypes of her Mrs. Allen, Mrs. Bennet, Miss Bates, Mr. Collins, or Mrs. Norris. When at last she began to publish, her stories appeared in rapid succession: 'Sense and Sensibility' in 1811; 'Pride and Prejudice' early in 1813; 'Mansfield Park' in 1814; 'Emma' in 1816; 'Northanger Abbey' and 'Persuasion' in 1818, the year following her death.

The six novels which have made so great a reputation for their author relate the least

AUSTEN — AUSTIN

sensational of histories in the least sensational way. 'Sense and Sensibility' might be called a novel with a purpose, that purpose being to portray the dangerous haste with which sentiment degenerates into sentimentality; and because of its purpose, the story discloses a less excellent art than its fellows. 'Pride and Prejudice' finds its motive in the crass pride of birth and place that characterize the really generous and high-minded hero, Darcy, and the fierce resentment of his claims to love and respect on the part of the clever, high-tempered, and chivalrous heroine, Elizabeth Bennet. 'Northanger Abbey' is a good-natured satire at the school of Mrs. Radcliffe; 'Persuasion,' a simple story of upper middle-class society; 'Mansfield Park,' a new and fun-loving version of 'Cinderella'; and 'Emma,' the history of the blunders of a bright, kind-hearted, and really clever girl, who contrives as much discomfort for her friends as stupidity or ill nature could devise. Numberless as are the novelist's characters, no two clergymen, no two British matrons, no two fussy spinsters, no two men of fashion, no two heavy fathers, no two smart young ladies no two heroines are alike. And this variety results from the absolute fidelity of each character to the law of its own development, each one growing from within and not being simply described from without. Nor are the circumstances which she permits herself to use less genuine than her people. What surrounds them is what one must expect; what happens to them is seen to be inevitable.

The low and quiet key in which her "situations" are pitched produces one artistic gain which countervails its own loss of immediate intensity: the least touch of color shows strongly against that subdued background. A very slight catastrophe among those orderly scenes of peaceful life has more effect than the noisier incidents and contrived convulsions of more melodramatic novels. Thus, in 'Mansfield Park' the result of private theatricals, including many rehearsals of stage love-making, among a group of young people who show no very strong principles or firmness of character, appears in a couple of elopements which break up a family, occasion a pitiable scandal, and spoil the career of an able, generous, and highly promising young man. To most novelists an incident of this sort would seem too ineffective; in her hands it strikes us as what in fact it is — a tragic misfortune and the ruin of two lives. In a word, it is life which Miss Austen sees with unerring vision and draws with unerring touch. See Austen-Leigh, 'Memoir of Jane Austen' (1871); Goldwin Smith, 'Life of Jane Austen' (1890); Adams, 'The Story of Jane Austen's Life' (1891); Malden, 'Jane Austen' (1889); Hill 'Jane Austen and Her Friends' (1900); Pollock, 'Jane Austen' (1899).

Aus'ten, Peter Townsend, American chemist: b. Clifton, N. Y., 1852, and educated at Columbia University, School of Mines, and in Germany and Switzerland. In 1876, he was appointed instructor of chemistry at Dartmouth; in 1877, professor of chemistry at Rutgers. From 1887 to 1893 he was engaged in industrial work, and 1893-8 was professor of chemistry at Brooklyn Polytechnic Institute. He has invented several useful manufacturing processes; has written a number of valuable papers, and translated Pinner's 'Repetitorium der Organ-

ischen Chemie' under the title 'An Introduction to the Study of Organic Chemistry.'

Austerlitz, ows'ter-lets, Moravia, a town on the Littawa, 13 miles southeast of Brunn. In the vicinity, on 2 Dec. 1805, was fought the famous battle between the French army of 80,000 men, commanded by Napoleon, and the combined Russian and Austrian armies, numbering 84,000, under their respective emperors; in which the former achieved a signal victory. According to Alison, the allies lost 30,000 in killed, wounded, and prisoners, and the French, 12,000. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on 26 December, by the Treaty of Presburg, which disastrously affected Austria. The battle of Austerlitz is sometimes called "The Battle of the Three Emperors."

Aus'terlitz, The Sun of, a term given to any favorable omen, in allusion to the brilliant appearance of the sun just before the battle of Austerlitz, and which Napoleon accepted as a token of coming victory.

Aus'tin, Saint. See AUGUSTINE, SAINT.

Aus'tin, Alfred, English poet, critic, and journalist: b. Headingly, near Leeds, 30 May 1835. He graduated from the University of London in 1853, was called to the bar in 1857, and was editor of the 'National Review,' (1883-93). In 1896 he was appointed poet laureate of England. He is the author of political books, novels, and many volumes of verse. The latter include 'The Season: a Satire' (1862); 'The Human Tragedy' (1862); 'The Golden Age: a Satire' (1871); 'The Tower of Babel,' a drama (1874); 'Savonarola,' a tragedy (1881); 'Veronica's Garden,' in prose and verse (1895). 'The Garden That I Love,' 'In Lamia's Winter Quarters,' and 'Haunts of Ancient Peace' (1902), are delightful volumes of mingled prose and verse. Opinion is much divided as to his merits as a poet, particularly in such works as 'Fortunatus, the Pessimist' (1891). In December 1899, he published a war poem, 'To Arms!' and, in May 1900, one on the relief of Mafeking.

Aus'tin, George Lowell, American physician and writer: b. Massachusetts, 1849; d. 1893. Among his numerous works are 'Perils of American Women'; 'Water-Analysis' (1882); 'Under the Tide'; 'Life of Franz Schubert'; 'Popular History of Massachusetts'; 'Life of Wendell Phillips' (1888).

Aus'tin, Henry, American lawyer and legal writer: b. Boston, Mass., 21 Dec. 1858. He is the author of several valuable books on 'American Farm and Game Laws'; 'American Fish and Game Laws'; 'Liquor Law in New England.'

Aus'tin, Jane (GOODWIN), American novelist: b. Worcester, Mass., 25 Feb. 1831; d. Boston, 30 March 1894. Her reputation rests on excellent stories describing the Pilgrim Fathers and the early colonists of Massachusetts, and include 'Fairy Dreams' (1860); 'Moonfolk' (1874); 'Mrs. Beauchamp Brown' (1880); 'A Nameless Nobleman' (1881); 'The Desmond Hundred' (1882); 'Nantucket Scraps' (1882); 'Standish of Standish' (1889); 'Betty Alden' (1891); and 'David Alden's Daughter and Other Stories' (1892).

JANE AUSTEN

AUSTIN

Aus'tin, John, English writer on jurisprudence: b. Creeling Mill, Suffolk, 3 March 1790; d. Weybridge, 1 Dec. 1859. From 1826 to 1835 he filled the chair of jurisprudence at London University. He served on several royal commissions, one of which took him to Malta; lived for some years on the Continent, and finally settled at Weybridge in Surrey. His fame rests on his great works, 'The Province of Jurisprudence Determined,' published in 1832; and his 'Lectures on Jurisprudence,' published by his widow between 1861 and 1863. His wife, Sarah, one of the Taylors of Norwich: b. 1793; d. Weybridge, 8 Aug. 1867; produced translations of German works, and other books bearing on Germany or its literature; also 'Considerations on National Education,' etc.

Aus'tin, Jonathan Loring, secretary and treasurer of Massachusetts: b. Boston, 2 Jan. 1748; d. 10 May 1826. He remained two years in Paris as Dr. Franklin's secretary. He also spent two years in England as agent of Dr. Franklin. On his return in May 1779, he was liberally rewarded by Congress. In 1780, in his passage to Spain as agent of the State, he was taken and carried to England. He afterward held the offices of state secretary and treasurer in Massachusetts, and died universally respected. His son, James Trecothick: b. Boston, 7 Jan. 1784, studied law, rose in the profession, and was attorney-general of the State from 1832 to 1843.

Aus'tin, Moses, an American who obtained the first grant from the Mexican government for the formation of an American colony in Texas: b. Durham, Ct.; d. January 1821. He forwarded to the commandant-general at Monterey, an application for permission to colonize 300 families in some part of Texas. The application was successful, and the enterprise prosecuted by his son, Stephen F. Austin (q.v.).

Aus'tin, Oscar Phelps, American statistician, chief of the bureau of statistics, treasury department: b. Illinois. At the age of 12 he removed with his parents to Nebraska, where he remained until manhood. He then engaged in journalism until his appointment as chief of the bureau of statistics, 9 May 1898. He has since lived in Washington, serving as Washington correspondent for newspapers in New York, Chicago, and other cities. He is the author of 'Uncle Sam's Secrets'; 'Uncle Sam's Soldiers'; and other publications for the instruction of youth in national and international affairs; also of official monographs 'Commercial China in 1900'; 'Commercial Japan'; 'Commercial Africa'; 'Russia and the Trans-Siberian Railway'; 'American Commerce'; 'Commercial Alaska'; 'Submarine and Land Telegraphs of the World'; 'Colonies of the World and Their Government'; 'Colonial Administration'; etc. He is associate editor of the 'National Geographic Magazine.'

Aus'tin, Stephen Fuller, American pioneer: b. 1792; d. 27 Dec. 1836. He was a son of Moses Austin (q.v.), followed up the grant previously issued to his father. By it he was clothed with almost absolute power over the colonists, and only obliged to report to the captain-general. He founded what is now the city of Austin, the capital of Texas. The colony prospered, and, being accompanied

by a considerable number of similar associations, promoted an influx of Americans to such an extent that they met 1 March 1833, without the concurrence of the Mexican population, in a convention to form a constitution for the as yet Mexican state of Texas. Austin was one of the delegates chosen to carry the result of their deliberations to the central government at Mexico, and obtain its ratification. The delays and frequent revolutions at Mexico leading him to despair of ever bringing his commission to a close, he addressed a letter, 2 Oct. 1833, to the municipality of Bexar, and through them to the people of Texas, recommending a union of all the municipalities to provide against the consequences of a probable refusal of their applications by organizing a state under the *Acta constitutiva* of 7 May 1824. This letter was considered treasonable, and Austin was arrested and held as a hostage for the good behavior of Texas. There he was detained until September 1835. He was appointed a commissioner to the United States in November 1835. This was before the Texan declaration of independence; and it was not till after his arrival at New Orleans, and the information of the union of Santa Anna with the federal party for the invasion of Texas, that he was brought to the point of recommending such a measure. He acted with prudence and patience, and was successful in preparing for the independence and annexation of the new republic. He is looked upon as one of the most eminent and honorable of the founders of Texan prosperity.

Aus'tin, William, American author: b. 1778; d. 1841; remembered for his striking and original tale, 'Peter Rugg, the Missing Man,' in effect a New England variant of the Wandering Jew legend.

Aus'tin, Minn., a city and county-seat of Mower County, situated on Red Cedar River, and on the Chicago G. W., and the Chicago, M. & St. P. R.R.'s. It is the centre of a fertile agricultural region, and has a large export trade, as well as a variety of manufacturing establishments, including a meat-packing factory, flour mills, cement works, railroad shops, brick works, creamery, etc. It is the seat of the Southern Minnesota Normal College, and has several fine public buildings, among them a Carnegie library. Austin was first settled in 1852. Pop. (1900) 5474.

Aus'tin, Tex., the capital and county-seat of Travis County, on the Colorado River. It is 81 miles north-northeast of San Antonio by the International & G. N. R.R., 186 miles west by north of Houston, and 230 miles northwest of Galveston, by the same, and the Houston & T. C. R.R.; and on the Austin & N. W. R.R. It is beautifully situated about 40 feet above the river, which here flows through attractive scenery, is navigable for river steamers in the winter, and is spanned by two bridges. An immense dam, 1,275 feet long by 67 feet above bed rock, the twelfth longest in the world, was completed in 1892, for water supply and power; but was carried away by a flood 7 April 1900. During its existence it created a large and handsome sheet of water called Lake McDonald, a favorite resort for fishing, hunting, and health-seeking parties, and famous for having two international regattas on it, Stansbury of Australia winning the championship of the world. There

AUSTRALASIA—AUSTRALIA

are manufactories of lumber and iron goods, flour and leather; and oil refineries. There is a very large export trade in agricultural produce and live stock, hides and wool, cotton and grain; it is also the wholesale supply centre for a great district in provisions, dry goods, drugs, agricultural implements, ranching supplies, etc. The city is well built with wide and well-shaded streets. The most prominent building is the capitol, one of the largest of such structures in the United States, built of granite at a cost of \$3,500,000. There are also the main building of the State University, which accommodates the law and literary departments; State asylums for the insane, blind, and deaf-mutes, and for colored patients of these classes; the State Confederate Home; St. Edward's College; the Tillotson Institute for Colored Pupils; seminaries and academies, besides the public school system. The State land office and the county court-house are prominent buildings. The government is administered under the revised charter of 1901, is by mayor, biennially elected; a city council, chosen half by wards and half at large; and officials elected partly by the council and partly by popular vote. The city owns its own waterworks and electric plant. The settlement was first called Waterloo, but in 1837, after the Texan revolution, incorporated and re-named after Stephen F. Austin (q.v.), the county being likewise named from William B. Travis (q.v.), killed at the Alamo. It was made the capital in 1839, and remained such after the admission of Texas as a State. The first free school in the State was established here in 1871. Pop. (1900) 22,258.

Australasia, às'trāl-ā'shīa, a geographical term of loose application, but usually regarded as comprehending the continental island of Australia and an unascertained number of other islands, some of them very little known, lying between lon. 110° and 180° E., and stretching from Papua or New Guinea, the farthest northern island of the division, to lat. 50° S. Besides the great island of Australia, it thus includes Tasmania, New Zealand, the Loyalty Islands (New Caledonia, etc.), Norfolk Island, New Hebrides, Solomon Islands, New Ireland (Neu-Mecklenburg), New Britain (Neu-Pommern), Admiralty Islands, and New Guinea, besides numerous other islands and island groups. The island of Timor and those lying west of it, though coming within the general boundary above indicated, belong to the Eastern or Indian Archipelago, called also Malasia. Australasia is estimated to have an area of 3,740,000 English square miles, and a population of 6,400,000. It forms one of three portions into which some geographers have divided Oceania, the other two being Malasia and Polynesia. Consult A. R. Wallace, 'Australasia.'

Austra'lia, an island continent of the southern hemisphere, southeast of Asia; between lat. 10° 41' and 39° 11' S.; lon. 113° 5' and 153° 16' E. Its greatest length from west to east is 2,400 miles; greatest breadth, 1,700 to 1,900 miles. It comprises the states of the Commonwealth of Australia, whose federation was proclaimed 1 Jan. 1901.

Area and Population.—The area and the population (exclusive of aborigines) of the different states composing the Commonwealth of Australia in 1901 were as follows:

Original States	Area. Sq. M.	Pop.
New South Wales.....	310,367	1,352,297
Victoria	87,884	1,200,918
Queensland	668,497	496,596
South Australia	903,690	362,604
Western Australia.....	975,920	184,553
Tasmania.....	26,215	172,475
Total..	2,972,573	3,767,443

Topography.—While there are many spacious harbors on the coast, there are few great indentations; the principal being the Gulf of Carpentaria, on the north, the Great Australian Bight, and Spencer Gulf, on the south. The chief projections are Cape York Peninsula and Arnhem Land in the north. Parallel to the north-east coast runs the Great Barrier Reef, extending for 1,000 miles. In great part the east coast is bold and rocky, and fringed with many small islands. Part of the south coast is low and sandy, and part presents cliffs several hundred feet in height.

Geology.—The interior, so far as explored, is largely composed of rocky tracts and barren plains with little or no water. The whole continent forms an immense plateau, highest in the east, low in the centre, and with a narrow tract of land usually intervening between the elevated area and the sea. The base of the table-land is granite, which forms the surface rock in a great part of the southwest, and is common in the higher grounds along the east side. Secondary (cretaceous) and Tertiary rocks are largely developed in the interior. Silurian rocks occupy a large area in south Australia, on both sides of Spencer Gulf. The mountainous region in the southeast and east is mainly composed of volcanic, silurian, carbonaceous, and carboniferous rocks, yielding good coal. No active volcano is known to exist, but in the southeast there are some craters only recently extinct. The highest and most extensive mountain system is a belt about 150 miles wide, skirting the whole eastern and southeastern border of the continent, and often called, in whole, or in part, the great dividing range, from forming the great water-shed of Australia. A part of it, called the Australian Alps, in the southeast contains the highest summits in Australia, Mount Kosciusko (7,175 feet), Mount Clark (7,256), and Mount Townshend (7,353). West of the dividing range are extensive plains or downs admirably adapted for pastoral purposes. The deserts and scrubs, which occupy large areas of the interior, are a characteristic feature of Australia. The former are destitute of vegetation, or are clothed only with a coarse, spiny grass that affords no sustenance to cattle or horses; the latter are composed of a dense growth of shrubs and low trees, often impenetrable till the traveler has cleared a track with his axe.

Water Courses.—The rivers of Australia are nearly all subject to great irregularities in volume, many of them at certain seasons showing a channel in which there is merely a series of pools, while at others they inundate the whole adjacent country. The chief is the Murray, which, with its affluents, the Murrumbidgee, Lachlan and Darling, drains a great part of the interior west of the dividing range, and falls into the sea on the south coast (after entering Lake Alexandrina). Its greatest tributary is

AUSTRALIA

the Darling, which may even be regarded as the main stream. On the east coast are the Hunter, Clarence, Brisbane, Fitzroy, and Burdekin; on the west the Swan, Murchison, Gascoyne, Ashburton, and De Grey; on the north the Fitzroy, Victoria, Flinders, and Mitchell. The Australian rivers are of little service in facilitating internal communication. Many of them lose themselves in swamps or sandy wastes of the interior. A considerable river of the interior is Cooper's Creek, or the Barcoo, which falls into Lake Eyre, one of a group of lakes on the south side of the continent having no outlet, and, accordingly, salt. The principal of these are lakes Eyre, Torrens, and Gairdner, all of which vary in size and saltiness according to the season. Another large salt lake of little depth, Lake Amadeus, lies a little west of the centre of Australia. Various others of less magnitude are scattered over the interior.

Climate.—The climate of Australia is generally hot and dry, but very healthy. In the tropical portions there are heavy rains, and in most of the coast districts there is a sufficiency of moisture, but in the interior the heat and drought are extreme. Considerable portions now devoted to pasturage are liable, at times, to suffer from drought. At Melbourne the mean temperature is about 56°, at Sydney about 63°. The southeast settled districts are at times subject to excessively hot winds from the interior, which cause great discomfort, and are often followed by a violent cold wind from the south ("southerly bursters"). In the mountainous and more temperate parts snow storms are common in June, July, and August.

Mineralogy.—Australia is a region containing a vast quantity of mineral wealth. Foremost come its rich and extensive deposits of gold, which, since the precious metal was first discovered, in 1851, have produced a total of more than \$1,350,000,000. The greatest quantity has been obtained in Victoria, but New South Wales and Queensland have also yielded a considerable amount. Probably there are rich stores of gold as yet undiscovered. Australia also possesses silver, copper, tin, lead, zinc, antimony, mercury, plumbago, etc., in abundance, besides coal, which is now worked to a considerable extent in New South Wales, and iron. Various precious stones are found, as the garnet, ruby, topaz, sapphire, and even the diamond. Of building stone there are granite, limestone, marble, and sandstone.

Plant Life.—The Australian flora presents peculiarities which mark it off by itself in a very decided manner. Many of its most striking features have an unmistakable relation to the general dryness of the climate. The trees and bushes have, for the most part, a scanty foliage, presenting little surface for evaporation, or thick leathery leaves well fitted to retain moisture. The most widely spread types of Australian vegetation are the various kinds of gum trees (*Eucalyptus*), the she-oak (*Casuarina*), the acacia or wattle, the grass tree (*Xanthorrhæa*), many varieties of *Proteaceæ*, and a great number of ferns and tree ferns. Of the gum tree there are found upward of 150 species, many of which are of great value. Specimens of the peppermint (*Eucalyptus amygdalina*) have been found to measure from 480 to 500 feet in height. As timber trees the most valuable members of this genus are the *E. ros-*

trata (or red gum), *E. leucoxylon*, and *E. marginata*, the timber of which is hard, dense, and almost indestructible. A number of the gum trees have deciduous bark. The wattle or acacia includes about 300 species, some of them of considerable economic value, yielding good timber or bark for tanning. The most beautiful and most useful is the golden wattle (*Acacia dealbata*), which in spring is adorned with rich masses of fragrant yellow blossom. Palms,—of which there are 24 species, all except the cocoa-palm peculiar to Australia,—are confined to the north and east coasts. In the "scrubs" already mentioned hosts of densely intertwisted bushes occupy extensive areas. The mallee scrub is formed by a species of dwarf eucalyptus, the mulga scrub, by a species of thorny acacia. A plant which covers large areas in the arid regions is the spinifex or porcupine grass, a hard, coarse and excessively spiny plant, which renders traveling difficult, wounds the feet of horses, and is utterly uneatable by any animal. Other large tracts are occupied by herbs or bushes of a more valuable kind, from their affording fodder. Foremost among those stands the salt-bush (*Atriplex nummularia*, order *Chenopodiaceæ*). Beautiful flowering plants are numerous. Australia also possesses great numbers of turf-forming grasses, such as the kangaroo grass (*Anthistiria australis*), which survives even a tolerably protracted drought. The native fruit trees are few and unimportant, and the same may be said of the plants yielding roots used as food; but exotic fruits and vegetables may now be had in the different colonies in great abundance and of excellent quality. The vine, the olive, and mulberry thrive well, and quantities of wine are now produced. The cereals of Europe and maize are extensively cultivated, and large tracts of country, particularly in Queensland, are under the sugar-cane.

Animal Life.—The Australian fauna is almost unique in its character. Its great feature is the total absence of all the forms of mammalia which abound in the rest of the world, their place being supplied by a great variety of marsupials—these animals being nowhere else found, except in the opossums of America. There are about 110 kinds of marsupials, of which the kangaroos, wallabies, wombat, koala, bandicoot, phalangers, opossums, and the fierce carnivorous dasyures are the best-known varieties; a wild dog (see DINGO) is common. Two extraordinary animals, the platypus, or water mole of the colonists (*Ornithorhynchus*), and the porcupine ant-eater (*Echidna*) constitute the lowest order of mammals (*Monotremata*), and are confined to Australia. Their young are produced from eggs. Australia now possesses a large stock of the domestic animals of England, which thrive there remarkably well. The breed of horses is excellent. Horned cattle and sheep are largely bred, the first attaining a great size, while the sheep improve in fleece and their flesh in flavor.

The birds of Australia are numerous and in great variety, all the more important orders and families of class *Aves* being represented. Eagles, some very large, measuring about 7 feet across the wings; falcons, and various species of hawks and owls, are numerous; and so also are parrots and cockatoos, many of them of the most beautiful plumage. Pigeons of various species, and the most delicate and

AUSTRALIA

varied hues, frequent sundry parts of the island. The largest Australian bird is the emu, which, though excelled in size by the ostrich, attains a height sometimes of more than seven feet, five and six being the average. It is widely diffused, but is rapidly disappearing from the more settled districts. The lyre bird with its magnificent lyre-shaped tail, the interesting bower birds, and the mound-building talegalla and megapodius, are natives of this land of peculiar natural productions. The gigantic jabiru stork may be seen on the borders of the rivers, lakes, or swamps, which also abound in the duck tribe. Other aquatic birds are the pelican, Australian goose, and that *rara avis* of the Latin writers, the black swan. The game birds,—pigeons, ducks, quail, geese, etc.,—are numerous. The number of species is about 650. There are many reptiles, the largest being the alligator, found in some of the northern rivers. There are upward of 60 different species of snakes, some of which are very venomous. Lizards, frogs and insects are also numerous in various parts. The seas, rivers and lagoons abound in fish of numerous varieties, and other aquatic animals, many of them peculiar. Whales and seals frequent the coasts. On the north coasts are extensive fisheries of trepang, much visited by native traders from the Indian Archipelago. Some animals of European origin, such as the rabbit and the sparrow, have developed into real pests in several of the colonies in recent years.

Peoples.—The natives belong to the Australian negro stock, and are sometimes considered the lowest as regards intelligence in the whole human family, though this is doubtful. They are believed to number about 31,000, exclusive of those in the unexplored parts. They are of a dark-brown or black color, with jet-black curly, but not wooly, hair, of medium size, but inferior muscular development. In the settled parts of the continent they are inoffensive, and rapidly dying out. They have no fixed habitations; in the summer they live almost entirely in the open air, and in the more inclement weather they shelter themselves with bark erections of the rudest construction. They have no cultivation and no domestic animals. Their food consists of such animals as they can kill, and no kind of living creature seems to be rejected, snakes, lizards, frogs, and even insects being eaten, often half raw. They are ignorant of the potter's art. In their natural condition they wear little or no clothing. They speak a number of different languages or dialects. The women are regarded merely as slaves, and are frightfully maltreated. They have no religion; they practice polygamy, and are said to sometimes resort to cannibalism, but only in exceptional circumstances. They are occasionally employed by the settlers in light kinds of work, and as horse-breakers; but they dislike continuous occupation, and soon give it up. The weapons of all the tribes are generally similar, consisting of spears, shields, boomerangs, wooden axes, clubs, and stone hatchets. Of these the boomerang is the most singular, being an invention confined to the Australians.

Government.—In addition to the central federated government (see AUSTRALIAN FEDERATION), each of the colonies has a governor, administration, and a legislature of its own. The governors are appointed by the Crown, and all

acts passed by the colonial legislatures must receive the royal assent. Each legislature consists of two houses, a Legislative Council and a Legislative Assembly, the lower house being elected by manhood suffrage. The aggregate annual revenue of the colonies is about \$100,000,000, the annual expenditure several millions more. The public debt is over \$500,000,000. The colonies have a considerable defensive force of militia and volunteers, also a number of gun-boats, torpedo-boats, etc., besides which there is always a squadron of British men-of-war on the Australian station. There is no established Church in any of the colonies. The denomination which numbers most adherents is the English or Anglican Church, next to which come the Roman Catholics, Presbyterians, and Methodists. Education is well provided for, instruction in the primary schools being, in some cases, free and compulsory, and the higher education being more and more attended to. There are flourishing universities in Melbourne, Sydney, and Adelaide. Newspapers are exceedingly numerous, and periodicals of all kinds are abundant. There is, as yet, no native literature of any distinctive type, but names of Australian writers of ability, both in prose and poetry, are beginning to be known beyond their own country.

Industrial Pursuits.—Pastoral and agricultural pursuits and mining are the chief occupations of the people, though manufactures and handicrafts also employ large numbers. For sheep rearing and the growth of wool the Australian colonies are unrivaled, and, while the production of gold has considerably decreased, that of wool is constantly on the increase. The great bulk of the wool exported goes to Great Britain, which, in recent years, has received over 300,000,000 pounds from the Australian colonies annually. The commerce is rapidly extending, and becoming, every year, more important to England, whence the colonists derive their chief supplies of manufactured goods in return for wool, gold, and other produce. Next to wool come the minerals, wheat, preserved meat, and tallow, hides and skins, cotton, tobacco, sugar, and wine as the most important items of export.

Gold Mining.—The mineral wealth of Australia has been the most important factor in the building up of the country. Gold was discovered in 1823, but it was nearly 30 years later before its full importance was realized. During 50 years, until 1900, the gold mined approximated in value to \$2,000,000,000, and gold mining is still the most important industry, after wool raising. The official figures for 1902 are as follows:

State	Gross Weight of Gold Ounces	Value
Victoria.....	784,746	\$15,056,951
New South Wales.....	300,289	5,259,582
Queensland.....	857,713	12,885,903
South Australia.....	29,112	489,083
West Australia.....	2,177,447	36,571,747
Tasmania.....	66,500	1,260,424
Total.....	4,215,801	\$71,523,690

The chief imports consist of textile fabrics, haberdashery, and clothing, machinery and metal goods. The aggregate imports, in 1897, were \$327,997,650 in value, the exports \$361,052,-

AUSTRALIA

630. There are upward of 12,000 miles of railway in actual use, or in course of construction, and about 35,000 miles of telegraph. The longest telegraph line is that running northward across the continent from Adelaide. The two chief routes for mails between Great Britain and the Australian colonies are by way of the Suez Canal, and by San Francisco across the American continent. The coinage is the same as in the mother country. Banks and banking offices are numerous, including post-office or other savings banks for the reception of small sums.

History.—It is doubtful when Australia was first discovered by Europeans. Between 1531 and 1542 the Portuguese published the existence of a land which they called Great Java, and which corresponded to Australia, and probably the first discovery of the country was made by them early in the 16th century. The first authenticated discovery is said to have been made in 1601, by a Portuguese named Manoel Godinho de Eredia. In 1606, Torres, a Spaniard, passed through the strait that now bears his name, between New Guinea and Australia. Between this period and 1628, a large portion of the coast line of Australia had been surveyed by various Dutch navigators. In 1664 the continent was named New Holland by the Dutch government. In 1688 Dampier coasted along part of Australia, and about 1700 explored a part of the west and northwest coasts. In 1770 Cook carefully surveyed the east coast, named a number of localities, and took possession of the country for Great Britain. He was followed by Bligh in 1789, who carried on a series of observations on the northeast coast, adding largely to the knowledge already obtained of this new world. Colonists had now arrived on the soil, and a penal settlement was formed (1788) at Port Jackson. In this way was laid the foundation of the future colony of New South Wales. The Moreton Bay district (Queensland) was settled in 1825; in 1835 the Port Philip district. In 1851 the latter district was erected into a separate colony under the name of Victoria. Previous to this time the colonies both of Western Australia and of South Australia had been founded—the former in 1829, the latter in 1836. The latest of the colonies is Queensland, which only took an independent existence in 1859. The discovery of gold in abundance took place in 1851, and caused an immense excitement and great influx of immigrants. The population was then only about 350,000, and was slowly increasing; but the discovery of the precious metal started the country on that career of prosperity which has since been almost uninterrupted. Convicts were long sent to Australia from the mother country, but transportation to New South Wales practically ceased in 1840, and the last convict vessel to West Australia arrived in 1868. Altogether about 70,000 convicts were landed in Australia (besides almost as many in Tasmania).

Exploration.—For 25 years after the establishment of a colony on the shores of Port Jackson, settlement was confined to the narrow strip of country shut in on the northwest and south by the Blue Mountains beyond which no one had penetrated, though many attempts to do so had been made. Along the sea the colony extended from Jervis Bay to Port Stephens, a distance of 165 miles. In 1813

the mountain barrier was successfully crossed by Messrs. Blaxland, Lawson, and Wentworth, and the plains beyond were at once occupied. In 1815 a practicable road was made across the mountains, and exploration was thereafter pushed on with the greatest vigor. In 1817 Oxley discovered and traced the Lachlan for some hundred miles, and later he discovered the Macquarie and other streams. In 1819 the Murrumbidgee was discovered. In 1824 Messrs. Hovell and Hume crossed the district now forming the colony of Victoria and reached the head of Port Phillip. Allan Cunningham, the botanist, made extensive explorations in 1823 and subsequent years, and the celebrated Capt. Sturt commenced his arduous and wonderful undertakings about the same time, nor should the names of Hume and George Macleay be forgotten. Major Mitchell continued the work, joining skill and science to much energy and good fortune. Meanwhile the survey of the coast begun by Flinders was ably continued by Capt. Parker King and others. The northwest coasts were next examined by explorers, but with little result. From Sydney the centre of exploration was moved to Adelaide, and from that city several famous expeditions set out. It was from Adelaide that Eyre started on most of his journeys, and from there also that Capt. Sturt began his survey of the lower Murray and Darling in 1844. Much exploration was done in Queensland about this time by Dr. Leichhardt under the auspices of the government of New South Wales. Leichhardt lost his life in 1848 in an attempt to cross the continent to the west coast. Very extensive discoveries were made by Messrs. A. C. and F. T. Gregory in the fifties, and in 1862 John M'Douall Stuart, after several gallant attempts, crossed the continent from Adelaide to the north coast and returned to the point of starting. In 1860–61 a well-equipped expedition left Melbourne to cross the continent; it was under the command of R. O'Hara, Burke, and W. J. Wills, astronomical and meteorological observer. The disastrous end of the expedition is well known. Several relief expeditions were fitted out to find traces of the Burke and Wills party and it fell to A. W. Hewitt to discover the sole survivor, King, who had been preserved from starvation by the kindly aid of the natives. Australia has never wanted for explorers, and from 1860 onward, a year has scarcely passed that an expedition of some kind has not been at work.

AUSTRALIA

Australia, South, one of the original states in the Commonwealth of Australia. It occupies the middle of Australia, and at first, as the colony of South Australia, extended between lon. 132° and 141° E., and from the Southern Ocean to lat. 26° N., having then an area of about 300,000 square miles. In 1861 a district lying to the west of the colony was added to it, so that its western boundary was shifted to the meridian of 129°. In 1863 it received in addition the country between its northern boundary and the opposite coast (this portion being now known as the Northern Territory), so that South Australia now possesses a territory extending across Australia, and occupying an area estimated at 903,690 square miles. It is bounded on the east by Victoria, New South Wales, and Queensland; on the west by Western Australia. Its greatest length from north to south is 1,850 miles, and its width 650 miles. The south coast, for the first 120 miles east of where it begins at Port Eucla, is backed by steep limestone ranges from 400 to 600 feet in height, but as a whole the coast is low and desolate-looking. In a straight line from Port Eucla on the west to Cape Northumberland, near the boundary of Victoria, the distance is 850 miles, but the coast-line between these points extends to nearly twice that distance, owing to the indentations of Spencer Gulf and the Gulf of St. Vincent. Opposite the latter is Kangaroo Island, the largest island on the Australian coast, excepting Tasmania. The coast of the Northern Territory is thickly strewn with islands, three of which are of large size. There are also some excellent ports, one of these, Port Darwin, where the overland telegraph and the cable from Batavia and the East meet, being among the finest harbors in Australia. On the eastern side of the Gulf of St. Vincent lie the most populous portions of the state, and here is situated Adelaide, the state capital.

The interior formation of South Australia widely differs from that of the more eastern states. The mountains here run from the sea to the interior, ending somewhat abruptly among the lakes. The principal chain, the Mount Lofty range, begins at Cape Jervis, and follows the shore of the Gulf of St. Vincent past Adelaide, meeting at the head of the gulf, the ridges forming the backbone of Yorke Peninsula. The range still running north is called Flinders range, and ends in a wide mass of mountain 3,000 feet high, separating the lakes Torrens, Eyre, Frome, and Blanche. All these so-called lakes are huge expanses of salt water, swamp, and mud. On the west of Spencer Gulf is Eyre Peninsula, through the heart of which runs the Gawler range, attaining an elevation of 2,000 feet, and ending on the shores of another series of lakes of the same character as Lake Torrens. The principal summits of the Mount Lofty range are Razor-back, in latitude 33° 20', and immediately north of it Mount Bryan, close to which is the celebrated Burra-Burra copper mine. The highest peaks of the Flinders range are Mount Remarkable, 3,179 feet, Brown 3,174 feet, and Arden 3,000 feet. None of the peaks in the Gawler range attain more than a moderate elevation. On the left bank of the Murray, and near its mouth, a range of moderately elevated heights proceed south-southeast, skirting the coast to its extremity near Cape Northumberland. Throughout these ranges the exist-

ence of volcanic agency at a former period is everywhere apparent. The Warburton range and the Stuart ranges lie beyond and to the north and west of the lakes; further north on the Tropic of Capricorn, are the MacDonnell ranges, rising to a height of 4,000 feet, from which the extreme western affluents of the Lake Eyre River system take their rise. The other portions of the territory to the north and west are almost level, and consist of either waterless plains or plains of sandstone boulders, with desert grass and spinifex.

Among the mountains east of Gulf of St. Vincent, primitive limestone, often in the form of a beautiful white marble, is very abundant. There are indications of a large variety of minerals throughout the state, but copper is the only one that has been met with in large quantities, the total production to the end of 1899 being valued at £23,000,000. Gold has been found in various places, but the quantity won has been small. In the Northern Territory gold has also been found over a considerable tract of country, and good progress has been made in mining, while other minerals are known to exist. Almost the only stream within the state proper, which deserves the name of river, is the Murray, which enters the colony on the east in latitude 34°, and flows first circuitously west and then south, into the extensive lagoon called Lake Alexandrina, communicating with the sea by a narrow opening. During the rainy season it is navigable by steamers through its whole course within the state, and for 1,500 miles in New South Wales. In the Northern Territory the Roper River is a fine large stream, navigable for sea-going vessels for 100 miles from its mouth in the Gulf of Carpentaria; the Victoria is also navigable. The climate of South Australia proper greatly resembles that of Sicily and Naples. During nine months of the year it is agreeable, the disagreeable portion of the year being the three summer months of December, January, and February, when the natural heat of the season is greatly increased by hot winds from the interior. What is called winter would be considered in England merely a wet autumn. There are no epidemic diseases. Scrofulous and tubercular diseases are rare, but diseases of the eyes are common in summer, being either occasioned by the impalpable dust floating in the atmosphere, or by exposure to the night air after the glare of the sun.

South Australia produces nearly all the fruits and vegetables that are cultivated in Europe, as well as others, but in temperate regions is chiefly distinguished as a wheat and grape-growing country. Besides supplying its own wants, it sends large quantities of wheat to the neighboring states and to Europe, where "Adelaide" wheat is held in high estimation. The area under wheat is about 1,750,000 acres. The quantity produced varies greatly with the season, but the average production is six bushels per acre. The area under vineyards is gradually extending, and now approaches 20,000 acres. Brandy is produced as well as wine. Hop-growing is attracting some attention, and the olive is also cultivated. The value of the exports of the state is £7,100,000, and of the imports £7,300,000, total £14,400,000. The chief exports are wool, wheat, flour, copper, and copper ore, skins, etc. The value of the wool exported is generally about £1,000,000, and of

ABORIGINAL AUSTRALIAN AND AUSTRALASIAN ART.

AUSTRALIA—AUSTRALIAN BALLOT

wheat and flour from £800,000 to £1,500,000, according to the season. The trade of a large part of New South Wales passes through South Australia. The revenue and expenditures are each about £2,700,000. The length of railways is 1,890 miles. There is a complete system of telegraphs, besides the great line from Adelaide across the continent to Port Darwin, a distance of 2,000 miles. The public debt of the state is £24,309,035, and has been mostly incurred for reproductive public works. See AUSTRALIA; AUSTRALIAN FEDERATION.

Australia, Western, one of the original states in the Commonwealth of Australia. It includes that portion of Australia west of lon. 129° E, and is bounded, east by South Australia, and northwest, and south by the Indian Ocean. It lies between the parallels of 13° 30' and 35° 8' S.; greatest length, 1,450 miles north to south; greatest breadth, 850 miles; area, 975,920 square miles. The coast-line measures about 3,000 miles, and, except on the south is indented by numerous bays, creeks, and estuaries. The coast is fringed by many islands, but none of any importance. The principal inlets are Cambridge Gulf, Admiralty Gulf, York Sound, Collier Bay, King Sound, Roebuck Bay, Exmouth Gulf, Shark Bay, Geographe Bay, and King George Sound, the last the most important as having Albany on its shore, the port of call for the European mail steamers. The chief rivers are the Ord and Fitzroy on the north, De Grey, Ashburton, Fortescue, Gascoign, Murchison, Greenough, Swan, and Blackwood on the west. The Swan River is important, as Perth, the capital, is situated on its banks. Some of the rivers within the tropics are large and navigable, but few of the others run all the year, and fewer still are navigable even for boats to any great distance. The interior was till recent years not well known, but at present there is little territory which has not been explored. The country is chiefly an alternation of ridges and hollows, sandy, without grass, and clothed with bushes and scrubby timber, without the trace of a water-course. The really settled and occupied portion of the state forms only a mere fraction of its whole area. The population is mostly collected in the southwest corner, where the first settlements were made, and around the recently discovered gold reefs. Scattered settlements stud the coast at various points. On the west coast are extensive banks covered with the pearl oyster, which give employment to a fleet of boats. The Kimberley district in the north is a region of great promise; it comprises 20,000,000 acres of well-watered land intersected by the Fitzroy River and other large streams, and is said to be admirably adapted for pastoral purposes, besides having a large area suitable for the cultivation of sugar, coffee, and rice. The greater part of the seaboard, except along the Australian bight, is separated from the interior by a low range of hills running parallel to it, and covered with forests. The fertile land exists in patches, and some of it is of a very rich character. The principal crops are wheat, barley, hay, and potatoes; the vine is also successfully cultivated, and excellent wine is made in the colony. The area under cultivation comprises about 140,000 acres, of which wheat occupies 42,000 acres, hay 84,000 acres, vines 2,750 acres. The live stock in 1899 numbered

2,210,000 sheep, 245,000 cattle, 62,000 horses, besides a large number of camels, pigs, goats, and poultry. An available area of 1,000 square miles is covered with jarrah forests. The jarrah is a species of eucalyptus (*E. marginata*); its timber is in great request for railway sleepers, for building purposes, and especially for marine constructions, having the valuable property of resisting the attacks of the white ant on land and the ship worm at sea. Considerable areas in the southwest are covered with karri (*E. diversicolor*). There are also numerous forests of sandalwood trees, the timber of which is exported in large quantities, chiefly to China for incense purposes. Flowers and fruits from all quarters of the globe grow luxuriantly. Among the fruits successfully cultivated are apples, pears, oranges, peaches, plums, apricots, figs, almonds, bananas, olives, etc. English vegetables may be profitably cultivated at almost all seasons. Bees thrive and produce abundant stores of honey.

The mineral resources of the state are not yet fully known. Gold has been discovered in large quantities, and Western Australia is now the chief gold-producing state of Australia, the Coolgardie gold fields being among the most productive. In 1899 the gold exported had the value of £6,246,731. Lead and copper exist abundantly, and several mines are in operation. Iron ore might be raised in almost inexhaustible quantities, and tin also exists. The gold discoveries have formed an epoch in the history of the state, and trade and population have recently increased very rapidly. The imports, which in 1887 were valued at £830,000, amounted in 1899 to £4,474,000, the exports in the latter year being £6,985,000. Besides gold the exports include wool, jarrah and karri timber, sandalwood, pearls, pearl shells, tin ore, skins, etc. The revenue has grown enormously. In 1881 it was £206,205; in 1891, £497,670; and in 1898, £2,754,747. The public debt is £9,203,738, equal to £53 16s. 8d. per inhabitant. There are about 1,400 miles of railway open. The principal towns are Perth, the capital, and Fremantle, which is the chief port. The first part of the state settled was the southwest corner, long known as the Swan River Settlement, established in 1829. From 1850 to 1868 it was a place for the transportation of convicts. In 1890 the state received a system of responsible government similar to that prevailing in the other colonies of Australia.

Australian Alps, a range of mountains in the southeast of Australia, extending over a length of about 400 miles. The highest peaks are in New South Wales, and the highest, according to Lendenfeld, is Mount Townshend (7,353 feet), belonging to a group which he calls the Kosciusko group. The peaks next in height belong to the Bogong group in Victoria, and the west of the Mitta Mitta, the highest of which is Mount Bogong (6,508 feet). They do not reach the snow line, though snow lies in the higher valleys all the summer. Geologically, the Australian Alps are composed mainly of very ancient metamorphic rocks, which have been worn down in the course of ages to tablelands, and which slope down rather steeply on all sides. Volcanic rocks cover the table-land to the south of Mount Bogong.

Australian Bal'lot. See BALLOT.

AUSTRALIAN FEDERATION — AUSTRIA

Australian Federation, the political union of the five Australian colonies, together with Tasmania. The first convention looking to this end was held at Hobart in January 1886. The colonies represented were Victoria, Queensland, Tasmania, Western Australia, and Fiji. Another conference took place in 1891, at Sydney, New South Wales, attended by delegates from each of the colonies. A plan of federal government was proposed, resembling in many of its features that of the United States. A draft bill to constitute the Commonwealth of Australia was adopted by the convention, and it was agreed to submit it to the approval of the individual legislatures of the several colonies. This bill met with success in the lower branch of but one colonial legislature—that of Victoria. In January 1895 there was a conference of premiers of five colonies at Hobart, and the Legislative Assembly of New South Wales passed a federal enabling act in November of that year, and notice of motion was given in other legislatures to bring in a similar bill. The first practical step was taken in 1898. A convention of representatives of New South Wales, Victoria, Tasmania, South Australia, and Western Australia, succeeded in drafting a constitution, which was submitted to the popular vote of each of those colonies in June. The constitution provided for a governor-general, appointed by the Crown; a federal parliament, composed of the Crown, represented by the governor-general, a Senate, and a House of Representatives. The powers of the parliament were set forth in 39 articles, and covered trade with other countries, taxation, coinage, weights and measures, foreign corporations, pensions, arbitration, etc. Free trade between the states was recognized. By the terms of the plebiscite, an affirmative vote of substantially one third of the electors of New South Wales, and of one fifth of the electors of each of the other colonies, was required to adopt this constitution. But the election returns in June were fatal to the scheme. While the majorities in the four lesser colonies were overwhelmingly in favor of the constitution, the requisite affirmative vote in New South Wales was not obtained.

On 2 Feb. 1899, a unanimous agreement was reached by the colonial premiers in conference at Melbourne, regarding the unsettled questions referred to them by the colonial legislatures, thus insuring the success of the federation project. In 1900, a bill making federation effective was introduced into Parliament, at London, and passed, the only amendment offered having reference to the royal prerogative. Later in that year the Earl of Hopetoun was appointed by the queen first governor-general. He resigned in May 1902.

Austrasia, âs-trá'shîa (the East Kingdom), the name given, under the Merovingians, to the Eastern possessions of the Franks, embracing Lorraine, Belgium, and the right bank of the Rhine. These districts, thickly inhabited by Franks, were of great importance at the time of the rise of the Frankish power.

Aus'tria (from the German OESTREICH or OESTERREICH, eastern empire), or AUSTRIA-HUNGARY, the collective designation of several states of central Europe, consisting of two semi-independent countries, each with its own parliament and government, but with one common

sovereign, army, and system of diplomacy, and also with a common parliament.

History of the Country till the Year 982—

After the Romans had vanquished the Noricans, 33 A.D., and gained possession of the Danube, the country north of the Danube, extending to the borders of Bohemia and Moravia belonged to the kingdom of the Marcomanni and Quadi; a part of lower Austria and Styria, with Vienna (Vindobona), a municipal city of the Roman empire, belonged to upper Pannonia; the rest of the country, with Carinthia and a part of Carniola, formed a portion of Noricum. Gorz belonged to the Roman province of Illyricum, and Tyrol to Rhetia. These limits became confused by the irruptions of the barbarians. The Boii, Vandals, Heruli, Rugi, Goths, Huns, Lombards, and Avars, in the course of the 5th and 6th centuries, successively occupied the country. But after the year 568, when the Lombards had established their power in upper Italy, the River Enns formed the boundary line between the German tribe of Bajuvarii, the proprietors of the territory above the Enns, and the Avars, who had removed from the east to the banks of that stream. In 611 the Wendi, a Slavonic tribe, appeared on the Murr, Drave, and Save. In 788 the duchy of Bavaria was dissolved, and the Avars passed over the Enns and invaded the counties of the Franks in the Bavarian territory. In 791 Charlemagne forced them to retire to the Raab, and united the territory extending from the Enns to the junction of the Raab with the Danube (the territory below the Enns) with Germany, under the name of Avaria, or the Eastern Mark (Marchia Orientalis), or Austria; and in the 10th century (in a document of Otho III. 996) it was called Oestirichi, equivalent to the modern Oesterreich. Many colonists, particularly from Bavaria, were sent by Charlemagne into the new province, and a margrave was appointed to administer the government. The archbishop of Salzburg was at the head of ecclesiastical affairs. After its separation from Verdun, in 843, Avaria formed the east boundary of the German empire. On the invasion of Germany by the Hungarians, in 900, Avaria fell into their hands, and was held by them till 955, when the Emperor Otho I., in consequence of the victory of Augsburg, reunited a great part of this province to the empire. By the power and address of its margraves the whole country was joined again with Germany, and in 1043, under the Emperor Henry III. and the Margrave Albert I. (the Victorious), its limits were extended to the Leitha.

Austria under the House of Bamberg till 1282.—From 982 to 1156 the margraviate of Austria was hereditary in the family of the counts of Badenurg (Bamberg); the succession, however, was not regulated by primogeniture, but by the will of the emperor. In ancient documents mention is made of the estates of Austria in the year 1096. After Henry the Proud (Duke of Bavaria and Saxony) was put under the ban of the empire, Leopold V., margrave of Austria, received the duchy of Bavaria in 1138 from the Emperor Conrad. But when the Margrave Henry, son of Leopold, under the title of *Ja-so-mir-Gott* (Yes-so-me-God), had again ceded it, in 1156, to Henry the Lion, the boundaries of Austria were extended so as to include the territory above the Enns, and the

AUSTRIA

whole was created a duchy with certain privileges. Under this Duke the court resided at Vienna. Duke Leopold VI., the son of Henry, received the duchy of Styria in 1192 as a fief from the Emperor Henry VI., it having been added to the empire by Otho I., in 955, by his victory over the Hungarians. It was this prince who imprisoned Richard Cœur de Lion, king of England. Duke Leopold VII., the youngest son of the former, erected a palace within the city of Vienna, which was long occupied by the Austrian monarchs, under the name of the old castle. Leopold VII., called the Glorious, established the hospital of the Holy Cross, made Vienna, which had adopted a municipal constitution in 1198, a staple town, and granted 30,000 marks of silver for the promotion of trade and commerce. In 1229 he purchased a part of Carniola from the ecclesiastical principality of Freisingen for 1,650 marks, and left the country in a flourishing condition to the youngest of his three sons, Frederick II., surnamed the Warrior. In 1236 this prince was put under the ban of the empire, on account of his joining the alliance of the cities of Lombardy against the Emperor Frederick II.; and Otho, Duke of Bavaria, seized upon his territory above the Enns as far as Lintz. The rest of the country was granted, as a fief by the emperor, to a margrave, and Vienna became an imperial city.

During the emperor's campaign in Italy Duke Frederick recovered the principal part of his lands, and his rights were confirmed by the emperor at Verona, 1245. The rights of Vienna as an imperial city were abolished, and Frederick was to be called king, as sovereign of Austria and Styria; but all his expectations of empire were disappointed by his death in the battle of the Leitha against Bela IV., king of Hungary, 15 July 1246, in the 35th year of his age. Thus the male line of the house of Bamberg became extinct. The period from 1246 to 1282 is styled the Austrian interregnum. The Emperor Frederick II. declared Austria and Styria a vacant fief, the hereditary property of the German emperors, and sent a governor to Vienna, the privileges of which, as an imperial city, were once more renewed. But the female relations of the deceased Duke Frederick, his sister Margaret (widow of the Emperor Henry VI), and his niece Gertrude, by the persuasion of Pope Innocent IV., in 1248, laid claim to the inheritance of their brother. The Margrave Hermann, with the aid of the Pope and a strong party, made himself master of Vienna, and of several Austrian cities. In Styria he was opposed by the governor Meinhard, count of Gorz. But Hermann died in 1250, and his son Frederick, who was afterward beheaded in 1268, at Naples, with Conradin of Suabia, was then only a year old. The whole country was distracted by various parties, and the Emperor Conrad IV. was prevented, by disputes with his neighbors, from turning his attention to Austria. In 1251 the states of Austria and Styria determined to appoint one of the sons of the second sister of Frederick the Warrior, Constantia (widow of the Margrave Henry the Illustrious), to the office of Duke. Their deputies were on the way to Misnia when they were persuaded by King Wenceslaus, on their entrance into Prague, to declare his son Ottocar Duke of Austria and Styria, who made every effort to

support his appointment by arms, money, and especially by his marriage with the empress widow Margaret. Ottocar wrested Styria from Bela, king of Hungary, by his victory of July 1260, in the Marchfeld; and in 1262 forced the Emperor Richard to invest him with both duchies. Soon after, by the will of his uncle Ulrich, the last Duke of Carinthia and Friuli (who died 1296), Ottocar became master of Carinthia, a part of Carniola connected with it, the kingdom of Istria, and a part of Friuli. But his arrogance soon caused his fall. In 1272 he refused to acknowledge Count Rudolph of Hapsburg emperor, and was obliged to defend himself against Rudolph. After an unsuccessful war he was forced to cede all his Austrian possessions in November 1276. In 1277 he attempted to recover these territories, but, in the battle of the Marchfeld, 26 Aug. 1278, he was slain, and his son Wenceslaus was obliged to renounce all claim to them, in order to preserve his hereditary estates. The Emperor Rudolph remained three years in Vienna, and then appointed his eldest son governor. But having succeeded in gaining the consent of the electors of Saxony and Brandenburg, of the three ecclesiastical electors, and of the count-palatine of the Rhine, he granted the duchies of Austria and Styria, with the province of Carinthia, to his two sons, Albert and Rodolph, 27 Dec. 1280.

Austria under the House of Hapsburg.—I. From 1282 to 1526. Albert and Rodolph transferred Carinthia to Meinhard, count of Tyrol, father-in-law to Albert. In 1283 they concluded a treaty, by which Albert was made sole possessor of Austria, Styria, and Carniola. Vienna, having again renounced its privileges as an imperial city, was made the residence of the court, and the successors of Rodolph, from this time, assumed Austria as the family title. The introduction of the Hapsburg dynasty was the foundation of the future greatness of Austria. The despotic Albert was assailed by Hungary and Bavaria and in 1298 he won the Roman crown in an engagement with Adolphus of Nassau. After this he undertook the conquest of Switzerland; but was assassinated 1 May 1308, at Rheinfelden, by his nephew, John of Suabia, from whom he had basely withheld his hereditary estates. The inheritance of John now fell to the five sons of the murdered Albert—Frederick, surnamed the Fair, Leopold, Henry, Albert, and Otho. They were forced to purchase of the Emperor Henry VII. the investiture of their paternal estates (consisting, in 1308, of 26,572 square miles) for 20,000 marks of silver. Under their father, in 1301, the margraviate of Suabia was added to the territories of Austria, and the contest with Bavaria ended in Austria obtaining Neuburg. On the contrary, the attempt of Duke Leopold, in 1315, to recover the forest towns of Switzerland, which had been lost under Albert, was frustrated by the valor of the troops of the Swiss confederacy in the battle of Morgarten. In 1314 his brother Frederick, chosen emperor of Germany by the electors, was conquered by his rival, the Emperor Louis (of Bavaria), in 1322, at Mühldorf, and was his prisoner for two years and a half in the castle of Trausnitz. The dispute with the house of Luxembourg, in Bohemia, and with Pope John XXII., induced the emperor, in 1325, to liberate his captive.

AUSTRIA

Upon this the latter renounced all share in the government, and pledged himself to surrender all the imperial domains which were still in the possession of Austria. But Leopold considered the agreement derogatory to his dignity and continued the war against Louis. Frederick, therefore, again surrendered himself a prisoner in Munich. Moved by his faithful adherence to his word, Louis concluded a friendly compact with Frederick, and made preparations for their common government, 7 Sept. 1325. These preparations, however, were never carried into execution; for the agreement had been concluded without the consent of the electors. Leopold died in 1326, and Henry of Austria in 1327; Frederick also died without children, 13 Jan. 1330, after which his brothers, Albert II. and Otho, came to a reconciliation with the Emperor Louis. After the death of their uncle, Henry, margrave of Tyrol, and Duke of Carinthia (the father of Margaret Maultasch), they persuaded the emperor to grant them the investiture of Tyrol and Carinthia, in May 1335; they ceded Tyrol, however, to John, king of Bohemia, by the treaty of 9 Oct. 1356, in behalf of his son John Henry, or rather of his wife, Margaret Maultasch. In 1344, after the death of Otho and his sons, Albert II., called the Wise, united all his Austrian territories, which, by his marriage with the daughter of the last count of Pfirt, had been augmented by the estates of her father in 1324, and by the Kyburg estates in Burgundy in 1326. Of the four sons of Albert II. (Rodolph, Albert, Leopold, and Frederick), Rodolph II. (IV.) completed the church of St. Stephen's, and died in Milan in 1365, without children, a short time after his youngest brother, Frederick. In 1379 the two surviving brothers divided the kingdom, so that Albert III. (with the Queue) became master of Austria, and gave the other territories to his brother, Leopold III. the Pious. Leopold had made repeated attempts to gain the Hapsburg possessions in Switzerland. He was killed 9 July 1386, on the field of Sempach, where he lost the battle, in consequence of the valor of Winkelried, and Albert administered the government of the estates of his brother's minor sons. Margaret Maultasch ceded Tyrol to him on the death of Meinhard, her only son, who was married to the sister of Albert. She retained nothing but a few castles and 6,000 marks of gold. Her claims to Bavaria also she renounced in consideration of receiving Scharding and three Tyrolese cities, Kitzbuhel, Ballenberg, and Kuffstein, and 116,000 florins of gold. In 1365 Leopold III. had bought the claims of the count of Feldkirch for 36,000 florins; for 55,000 florins Austria received Brisgau from the count of Furstenberg, with the cities of Neuberg, Old Brisach, Kentzingen, and Billingen. The remainder of Carniola and the Windisch Mark, after the death of the last count of Gorz, were purchased, together with the county of Pludentz, from the count of Werdenberg, and the possessions of the count of Hogenberg, for 66,000 florins; and the city of Trieste was acquired in 1380 by aiding in the war between Hungary and Venice. Moreover, the two governments of upper and lower Suabia were pledged for 40,000 florins by the king of Rome, Wenceslaus, to Duke Leopold. The Austrian and Styrian lines, founded by Albert III. and Leopold III., his

brother, continued for 78 years. In 1395, when Albert III. died, his only son, Albert IV., was in Palestine. On his return he determined to take vengeance on Procopius, margrave of Moravia, for his hostile conduct; but he was poisoned in 1404 at Znaym. His young son and successor, Albert V., was declared of age in 1410; and being the son-in-law of the Emperor Sigismund, he united the crowns of Hungary and Bohemia in 1437, and connected them with that of Germany in 1438. But in the following year the young prince died. His posthumous son, Ladislaus, was the last of the Austrian line of Albert, and its possessions devolved on the Styrian line, 1457.

From this time the house of Austria has furnished an unbroken succession of German emperors. Hungary and Bohemia were lost for a time by the death of Albert V., and, after the unhappy contests with the Swiss, under Frederick III., the remains of the Hapsburg estates in Switzerland. But several territories were gained; and, to increase the rising splendor of the family, the emperor conferred upon the country the rank of an archduchy. The dispute which broke out between Frederick and his brothers Albert and Sigismund, relating to the divisions of their paternal inheritance, ended with the death of Albert in December 1464. In the course of the troubles which resulted from this quarrel the emperor was besieged in the citadel of Vienna by the citizens, who favored the cause of the murdered prince. Sigismund now succeeded to his portion of the estate of Ladislaus and Frederick became sole ruler of all Austria. His son Maximilian, by his marriage with Mary, the surviving daughter of Charles the Bold, united the Netherlands to the Austrian dominions. But it cost Maximilian much anxiety and toil to maintain his power in this new province, which he administered as the guardian of his son Philip. After the death of his father, 19 Aug. 1493, he was made emperor of Germany, and transferred to his son Philip the government of the Netherlands. Maximilian I. added to his paternal inheritance all Tyrol, and several other territories, particularly some belonging to Bavaria. He also acquired for his family new claims to Hungary and Bohemia. During his reign Vienna became the great metropolis of the arts and sciences in the German empire. The marriage of his son Philip to Joanna of Spain raised the house of Hapsburg to the throne of Spain and the Indies. But Philip died in 1506, 13 years before his father, and the death of Maximilian, which happened 12 Jan. 1519, was followed by the union of Spain and Austria; his grandson (the eldest son of Philip), Charles I., king of Spain (see CHARLES V.), was elected emperor of Germany. In the treaty of Worms, 28 April 1521, and of Ghent, 7 May 1540, he ceded to his brother Ferdinand all his hereditary estates in Germany, and retained for himself the kingdom of the Netherlands. The house of Austria was now the proprietor of a tract of country in Europe comprising 360,230 square miles. The Emperor Charles V. immediately increased the number of provinces in the Netherlands to 17, and confirmed their union with the German states, which had been concluded by his grandfather, under the title of the circle of Burgundy. In 1526 Austria was recognized as a European monarchy.

AUSTRIA

II. From 1526 to 1740. Ferdinand I., by his marriage with Anna, the sister of Louis II., king of Hungary, who was killed in 1526 in the battle of Mohacs, acquired the kingdoms of Hungary and Bohemia, with Moravia, Silesia, and Lusatia, the appendages of Bohemia. Bohemia rejoiced to hail Ferdinand its king. Notwithstanding the divided opinions of the nobles, and the rising fortune of his adversary, John von Zapolya (see HUNGARY), he was raised to the throne of Hungary, 26 Nov. 1526, by the Hungarian Diet, and was crowned 5 Nov. 1527. But Zapolya resorted for assistance to the Sultan, Soliman II., who appeared in 1529 at the gates of Vienna. The capital was rescued from ruin solely by the count of Salm, general of the Austrian army, and the imperial forces compelled Soliman to retreat. In 1535 a treaty was made by which John von Zapolya was allowed to retain the royal title and half of Hungary, and his posterity were to be entitled to nothing but Transylvania. But after the death of John new disputes arose, in which Soliman was again involved, and Ferdinand maintained the possession of lower Hungary only by paying the war-like Sultan the sum of 30,000 ducats annually. This took place in 1562 Ferdinand was equally unsuccessful in the duchy of Wurtemberg. This province had been taken from the restless Duke Ulrich by the Suabian confederacy, and sold to the Emperor Charles V.; and when his estates were divided it fell to Ferdinand. Philip, landgrave of Hesse, the friend of Duke Ulrich, took advantage of the opportunity offered him by the embarrassment of Ferdinand in the Hungarian war. With the aid of France he conquered Wurtemberg; but France ceded it again to Ulrich in the treaty of Caden, in Bohemia, concluded 29 June 1534, on condition that the province should still be a fief of Austria, and after the extinction of the male line of the Duke that it should revert to that country. Ferdinand received also the imperial crown in 1556, when his brother Charles laid by the sceptre for a cowl. He died 25 July 1564, with the fame of an able prince, leaving 3 sons and 10 daughters. According to the directions given in his will, the three brothers divided the patrimony, so that Maximilian II., the eldest son, who succeeded his father as emperor, obtained Austria, Hungary, and Bohemia; Ferdinand, the second son received Tyrol and Hither Austria; and Charles, the third, became master of Styria, Carinthia, Carniola, and Gorz. But in 1595, after the death of the Archduke Ferdinand, the husband of Philippine Welser, the fair maid of Augsburg, his sons Andrew (cardinal and bishop of Constance and Brixen, and governor of the Netherlands for Spain) and Charles (margrave of Burgau) were declared incompetent to succeed their father, and his possession reverted to his relations. In Hungary the Emperor Maximilian met with far better fortune than his father had done. The death of Soliman at Szigeth in 1566 was followed by a peace, and in 1572 Maximilian crowned his eldest son, Rodolph, king of Hungary; he was afterward crowned king of Bohemia, and was elected king of Rome. In his attempts to add the Polish crown to his Austrian dominions he was equally unsuccessful with his fourth son, Maximilian, who engaged in a similar enterprise after the decease of

Stephen Bathori in 1587. Maximilian died 12 Oct. 1576, and Rodolph the eldest of his five sons, succeeded to the imperial throne. The most remarkable events by which his reign is distinguished are the war against Turkey and Transylvania, the persecutions of the Protestants, who were all driven from his dominions, and the circumstances which obliged him to cede Hungary in 1608, and Bohemia and his hereditary estates in Austria in 1611, to his brother Matthias. From this time we may date the successful exertions of the Austrian sovereigns to put down the restless spirit of the nation, and to keep the people in a state of abject submission. Matthias, who succeeded Maximilian on the imperial throne, concluded a peace for 20 years with the Turks; but he was disturbed by the Bohemians, who took up arms in defense of their religious rights. Matthias died 20 March 1619, before the negotiations for a compromise were completed. The Bohemians refused to acknowledge his successor, Ferdinand II., and chose Frederick V., the head of the Protestant League, and elector of the palatinate, for their king. After the battle of Prague, 1620, Bohemia submitted to the authority of Ferdinand. He immediately applied himself to eradicate Protestantism out of Bohemia proper and Moravia. At the same time he deprived Bohemia of the right of choosing her king, and of her other privileges. He erected a Catholic court of reform, and thus led to the emigration of thousands of the inhabitants. This large exodus of inhabitants did much to retard the growth of Bohemia. In fact the religious wars waged upon Bohemian soil for so long a time, dating back to the first outbreaks of the Hussites, with the subsequent agitations and conflicts consequent upon the Reformation, long and seriously hampered that state's general development up to modern times. The Austrian states also favoring, in general, the Protestant religion, were compelled by Ferdinand to swear allegiance to him, and Lutheranism was strictly forbidden in all the Austrian dominions. The province of Hungary, which revolted under Bethlen Gabor, prince of Transylvania, was, after a long struggle, subdued. This religious war dispeopled, impoverished, and paralyzed the energies of the most fertile provinces of the house of Austria. During the reign of Ferdinand III., the successor of Ferdinand II. (1637-57), Austria was continually the theatre of war.

In the midst of these troubles Ferdinand ceded Lusatia to Saxony at the peace of Prague, concluded in 1635; and when the war was ended he ceded Alsace to France, at the peace of Westphalia in 1648. The Emperor Leopold I., son and successor of Ferdinand III., was victorious through the talents of his minister Eugene, in two wars with Turkey; and Vienna was delivered by John Sobieski and the Germans from the attacks of Kara Mustapha in 1683. In 1687 he changed Hungary into a hereditary kingdom, and joined to it the territory of Transylvania, which had been governed by distinct princes. Moreover, by the peace of Carlovitz, concluded in 1699, he restored to Hungary the country lying between the Danube and the Theiss. It was now the chief aim of Leopold to secure to Charles, his second son, the inheritance of the Spanish monarchy, then

AUSTRIA

in the hands of Charles II., king of Spain, who had no children; but his own indecision, and the policy of France, induced Charles II. to appoint the grandson of Louis XIV. his successor. Thus began the war of the Spanish Succession (see SUCCESSION WARS) in 1701. Leopold died 5 May 1705, before it was terminated. Emperor Joseph I., his successor and eldest son, continued the war, but died without children, 17 April 1711. His brother Charles, the destined king of Spain, immediately hastened from Barcelona to his hereditary states, to take upon him the administration of the government. He was elected emperor 24 December of the same year; but was obliged to accede to the peace of Utrecht, concluded by his allies at Rastadt and Baden in 1714. By this treaty Austria received the Netherlands, Milan, Mantua, Naples, and Sardinia. In 1720 Sicily was given to Austria in exchange for Sardinia. The duchy of Mantua, occupied by Joseph in 1708, was now made an Austrian fief, because it had formed an alliance with France prejudicial to the interests of Germany. This monarchy now embraced 191,621 square miles. Its annual income was between 13,000,000 and 14,000,000 florins, and its army consisted of 130,000 men; but its power was weakened by new wars with Spain and France. In the peace concluded at Vienna 1735 and 1738, Charles VI. was forced to cede Naples and Sicily to Don Carlos, the Infante of Spain, and to the king of Sardinia a part of Milan, for which he received only a part of Parma and Piacenza. In the next year, by the peace of Belgrade, he lost nearly all the fruits of Eugene's victories, even the province of Temeswar; for he was obliged to transfer to the Porte, Belgrade, Servia, and all the possessions of Austria in Walachia and Bosnia. All this Charles VI. willingly acceded to, in order to secure the succession to his daughter, Maria Theresa, by the Pragmatic Sanction. This law of inheritance was passed 1713-19, and acknowledged one after another by all the European powers.

Austria under the House of Hapsburg-Lorraine.—By the death of Charles VI., 20 Oct. 1740, the male line of the Austrian house of Hapsburg became extinct; and Maria Theresa having married Stephen, Duke of Lorraine, ascended the Austrian throne. On every side her claims were disputed, and rival claims set up. A violent war began in which she had no protector but England. Frederick II. of Prussia subdued Silesia; the elector of Bavaria was crowned in Linz and Prague, and in 1742 chosen emperor under the name of Charles VII. Hungary alone supported the queen. But in the peace of Breslau, concluded 4 June 1742, she was obliged to cede to Prussia, Silesia, and Glatz, with the exception of Teschen, Jagerndorf, and Troppau. Frederick II., by assisting the party of Charles VII., soon renewed the war. But Charles died 20 Jan. 1745, and the husband of Theresa was crowned emperor of Germany under the title of Francis I. A second treaty of peace, concluded 25 Dec. 1745, confirmed to Frederick the possession of Silesia. By the peace of Aix-la-Chapelle, 18 Oct. 1748, Austria was obliged to cede the duchies of Parma, Piacenza, and Guastalla to Philip, Infante of Spain, and several districts of Milan to Sardinia. The Austrian monarchy was now firmly established;

and it was the first wish of Maria Theresa to recover Silesia. With this object in view she formed an alliance with France, Russia, Saxony, and Sweden. This was the origin of the Seven Years' war; but, by the peace of Hubertsberg, 1763, Prussia retained Silesia, and Austria had sacrificed her blood and treasure in vain. The first paper money was now issued in Austria, called state obligations, and the Emperor Francis erected a bank to exchange them. After his death, 18 Aug. 1765, Joseph II., his eldest son, was appointed colleague with his mother in the government of his hereditary states, and elected emperor of Germany. To prevent the extinction of the male line of her family Maria Theresa now established two collateral lines; the house of Tuscany, in her second son, Peter Leopold; and the house of Este, in the person of the Archduke Ferdinand. For these separations Maria Theresa indemnified the country by the confiscation of several cities, formerly pledged to Poland by Hungary, without paying the sum for which they stood pledged; by obtaining Galicia and Lodomeria in the first profligate division of the kingdom of Poland in 1772; and by the capture of Bukowina, which was ceded by the Porte in 1777. In the peace of Teschen, 13 May 1779, Austria received Innviertel, and the vacant county of Hohenembs in Suabia, the county of Falkenstein, and the Suabian territories of Tettwang and Argen; and thus at the death of the empress, 28 Nov. 1780, Austria contained 234,684 square miles; it had lost 16,366 square miles, and gained 34,301. The population was estimated at 24,000,000; but the public debt also had increased to 160,000,000 florins. The administration of the empress was distinguished by substantial improvements in connection with government, agriculture, trade, and commerce, the education of the people, the promotion of the arts and sciences, and of religion. The foreign relations of the kingdom also, even those with the Roman court, were happily conducted by the talents of her minister, Kaunitz.

Her successor, Joseph II., was active and restless; impartial, but too often rash and violent. While a colleague with his mother in the government he diminished the expenses of the state, and introduced a new system in the payment of pensions and of officers. But after the death of his mother all his activity and talent as a sovereign was fully developed. As severe to the military as to the civil officers, he adhered, however, to liberal principles. The censorship of the press was reformed; the Protestants received full toleration, and the rights of citizens; the Jews were treated with kindness; 900 convents and religious establishments were abolished, and even the visit of Pius VI. made no alteration in Joseph's system of reformation. The system of education he subjected to revision and improvement; and he tried to foster manufactures by duties on foreign goods. But his zeal excited the opposition of the enemies of improvement. The low countries revolted, and his vexation probably led him to attempt the exchange of the Netherlands, under the title of the kingdom of Austrasia, for the palatinate of Bavaria under an elector. But the project was frustrated by the constancy and firmness of the next agnate, the Duke of Deux-Ponts, and by the German league concluded by

AUSTRIA

Frederick II. Joseph was equally unsuccessful in the war of 1788 against the Porte. His exertions in the field destroyed his health; and grief at the rebellious disposition of his hereditary states accelerated his death, which happened 20 Feb. 1790. Joseph II. was succeeded by his eldest brother, Leopold II. By his moderation and firmness he quelled the turbulent spirit of the Netherlands, and restored tranquillity to Hungary. The treaty of Reichenbach with Prussia, 27 July 1790, and the treaty of Sistova, 4 Aug. 1791, led to a peace with the Porte. The unhappy fate of his sister and her husband, Louis XVI. of France, induced him to form an alliance with Prussia, but he died 1 March 1792, before the revolutionary war broke out. Soon after the accession of his son, Francis II., to the throne, and before he was elected German emperor, France declared war against him as king of Hungary and Bohemia. In the first articles of peace, dated at Campo Formio, 17 Oct 1797, Austria lost Lombardy and the Netherlands, and received, as a compensation, the largest part of the Venetian territory; two years previous, in 1795, in the third division of Poland, the Austrian dominions had been enlarged by the addition of west Galicia. In the beginning of the year 1799, the Emperor Francis, in alliance with Russia, renewed the war with France. But Napoleon extorted the peace of Lunéville, 9 Feb. 1801, and Francis acceded to it, without the consent of England. By the conditions of the treaty he was to cede the county of Falkenstein and the Frickthal. Ferdinand, Grand Duke of Tuscany, at the same time renounced his claim to this province and received, in return for it, Salzburg and Berchtesgaden, with a part of the territory of Passau, and was afterward made master of the largest part of Eichstädt, and honored with the title of elector. Austria obtained the Tyrolean archbishoprics, Trent and Brixen, and, notwithstanding its cessions of territory to France, had gained, including its acquisitions in Poland, 9,580 square miles; this made the whole extent 253,770 square miles. The public debt had also increased to 1,220,000,000 florins.

The first consul of France now caused himself to be proclaimed emperor; and 11 Aug. 1804, Francis declared himself hereditary emperor of Austria, and united the Austrian states under the name of the empire of Austria. Immediately after this important act he took arms once more with his allies, Russia and Great Britain, against the government of France. The war of 1805 was terminated by the peace of Presburg, (26 Dec 1805). By the conditions of the treaty Francis was obliged to cede to France the remaining provinces of Italy; to the king of Bavaria, Burgau, Eichstadt, a part of Passau, all Tyrol, Vorarlberg, Hohenembs, Rothenfels, Tettngang, Argen, and Lindau; to the king of Wurtemberg the five towns lying on the Danube, the county of Hohenberg, the landgraviate of Nellenburg, Altdorf, and a part of Brisgau; and to the Grand Duke of Baden the remainder of Brisgau, Ortenau, Constance, and the commandery of Meinau. He received, in return, Salzburg and Berchtesgaden; the elector of Salzburg was compensated by the province of Würzburg; and the dignity of grand master of the Teutonic order was made hereditary in the house of Austria. Thus ended a

war which cost the Austrian monarchy, besides the territories just enumerated, 90,000,000 florins, which were carried away by the French from Vienna, and 800,000,000 for the other expenses of the war; of which Francis paid a large proportion from his private purse. After the formation of the Confederation of the Rhine (12 July 1806) Francis was forced to resign his dignity as emperor of Germany (6 Aug. 1806), which had been in his family more than 500 years. The old German, or Holy Roman, empire thus came to an end, and Francis had now only the title of Francis I., emperor of Austria. In 1809 he resolved on a new war with France, aided only by Great Britain, which did nothing more than furnish some pecuniary assistance and made a useless attack on Walcheren. Austria fought courageously, but in vain. The peace of Vienna (14 Oct. 1809) cost the monarchy 42,380 square miles of territory, 3,500,000 subjects, and more than 11,000,000 florins of revenue. The public debt was also increased to 1,200,000,000 florins, and all the paper money in circulation was estimated at 950,000,000.

Napoleon, after tearing from the Austrian monarchy its fairest provinces—the duchy of Salzburg, with Berchtesgaden, Innviertel, western Hausruckviertel, Carniola, and Gorz, Trieste, the circle of Villach, a large part of Croatia, Istria, a part of the Grisons, the Bohemian territories in Saxony, all west Galicia, the circle of Zamoski in east Galicia, Cracow, with half the salt works of Wieliczka, the circle of Tarnopol, and many other territories which were given to Russia—formed a personal connection with the ancient family of Hapsburg, by his marriage with Maria Louisa, daughter of the emperor of Austria, and (14 March 1812) concluded an alliance with the emperor Francis against Russia. But the emperor of France was repulsed on his invasion of this country; Prussia rose up against him; and after the Congress of Prague had separated without accomplishing anything, Francis, 12 Aug. 1813, declared war against France, and formed an alliance, 9 Sept. 1813, at Teplitz, with Great Britain, Russia, Prussia, and Sweden, against his son-in-law. In the battle of Leipsic, the Austrian troops took an honorable part. The firmness with which the emperor signed the act of proscription against his son-in-law, and fixed the fate of his daughter and her infant, excited general respect. He signed the same act against Napoleon a second time, when he returned from Elba. He also opposed Murat in Italy. Yet the Austrian cabinet endeavored to provide for young Napoleon in the settlement of the affairs of France. By the Congress of Vienna, 1814-15, Austria gained the portion of Italy which is usually known as Lombardy and Venetia, and recovered, together with Dalmatia, the hereditary territories which it had been obliged to cede. The former Grand Duke of Würzburg, on the contrary, ceded his territory to Bavaria, and again took possession of Tuscany. The final act resulting from the congress was signed in 1820. In 1821 liberal movements in Italy were put down. The July revolution of 1830, in France, caused warlike preparations to be made; but after Great Britain had acknowledged the new government Austria acknowledged it also. Insurrections which took place in Modena, Parma, and the Papal states, 1831-2, were

AUSTRIA

suppressed without much difficulty. In the London conference relative to the affairs of Belgium Austria took an active share; but in proportion as Great Britain and France became more closely united, Austria entered into more intimate relations with Russia and Prussia. In the Polish insurrection Austria ultimately gave indications of a strong leaning in favor of Russia. The death of the Emperor Francis I., 2 March 1835, and the accession of Ferdinand I. made little change in the Austrian system of government. Metternich still continued at the head of affairs and to foster the reactionary policy. In 1846 the failure of the Polish insurrection had led to the incorporation of Cracow with Austria, but discontent with the government very widely prevailed in the empire. In Italy, the declarations of Pio Nono in favor of reform, and the concessions into which most of the other governments of the Italian peninsula had been hurried, increased the difficulties of Austria. In Hungary the constitutional opposition became stronger and stronger, and latterly, under the guidance of Kossuth and other popular agitators, assumed the form of a great constitutional movement. In 1848 the expulsion of Louis Philippe shook all Europe to its foundations. Metternich found it impossible any longer to guide the ship of state, and the government found itself compelled to grant a free press, and allow the citizens freely to arm themselves. The popular movement made great progress in Hungary; and in Italy a formidable insurrection broke out, threatening the very existence of the Austrian power in the peninsula. In the very centre of the empire, in Vienna itself, the insurrection made equal progress, and the royal family, no longer in safety, removed to Innsbruck. The Austrian monarchy appeared now to be hanging by a thread. The Hungarian diet declared itself permanent, under the presidency of Kossuth. Various ministerial changes took place, and at last the emperor abdicated in favor of his nephew, Francis Joseph. More vigorous measures were now adopted, and Austria, strongly aided by the forces of Russia, succeeded in suppressing the Hungarian insurrection. Haynau, on the occasion, rendered himself notorious by his severity, and Hungary underwent the fate of a conquered country. The year 1855 is memorable in Austrian history for the conclusion of a concordat with the Pope which put the educational and ecclesiastical affairs of the empire entirely into the hands of the papal see. It established an ecclesiastical censorship of the press, and placed all schools, even private schools, under the surveillance of the bishops; it proclaimed the complete independence of the bishops in relation to the civil government, so that all decrees proceeding from Rome might be published without obtaining the royal *placet*, and it authorized the bishops to convoke the provincial councils and diocesan synods without the consent of the civil authority. In 1859 the hostile intentions of France and Sardinia against the possessions of Austria in Italy became so evident that she declared war by sending an army across the Ticino, but after disastrous defeats at Magenta and Solferino she was compelled to cede Milan and the northwest portion of Lombardy to the Sardinian king. In 1864 she joined with Prussia and the other German states in the spoliation of Denmark, but a dispute about the con-

quered provinces of Schleswig-Holstein involved her in a war with her allies (1866), while at the same time Italy renewed her attempts for the recovery of Venice. Austria had accordingly to show front both in the north and in the south. The southern army under Archduke Albert fought successfully, defeating the Italians under Victor Emanuel at Custoza, 24 June, and driving them back across the Mincio, but the fortune of the northern army under Gen. Benedek was very different. On 3 July Benedek was completely defeated by the Prussian forces at Koniggratz (Sadowa) in Bohemia, and the road to Vienna lay open to the victors. Francis Joseph now ceded Venetia to Napoleon III., and claimed his intervention to assist in procuring a peace, evidently wishing to make a separate treaty with Italy, so as to be at liberty to employ the southern army against Prussia. This design did not succeed, however. Both Italy and Prussia were willing to accept the mediation of Napoleon, but Italy would not hear of a separate arrangement, and continued the war. On 20 July Admiral Tegenhoff defeated the Italian fleet near the Dalmatian island Lissa; but, on the other hand, the Prussians continued to advance into Austria, and threatened Vienna. Francis Joseph accordingly saw himself obliged to conclude a peace with Prussia 23 August, and a little later peace was concluded with Italy also, 3 October. The result of the war was the cession of Venetia through France to Italy, and the withdrawal of Austria from all interference in the affairs of Germany (See SEVEN WEEKS' WAR).

Since 1866 Austria has been occupied chiefly with the internal affairs of the empire. The first aim of the government was to restore the constitution of the state, which had been established in February 1861, but which had been suspended since 1865 owing to the demand of Hungary for self-government. As Austrian statesmen were anxious for a settlement of the dispute, the Hungarian demands were finally agreed to, and the empire of Austria divided into two parts, the one made up of the Cisleithan or Slavonic-German provinces, the other of the Transleithan provinces, the latter forming together the kingdom of Hungary. These two divisions of the empire were to be entirely independent, except in matters of diplomacy and military and naval matters—to some extent also in matters of finance. This settlement was consummated by the coronation of the Emperor Francis Joseph I. as king of Hungary, which took place at Pesth-Ofen, on 8 June 1867. During the session of the Reichsrath, that is, the diet of the Cisleithan provinces, held in the same year, the important question of the concordat of 1855 came up for discussion. The Liberal majority in the diet were desirous of seeing it entirely repealed, but as they fully recognized the insuperable obstacles in the way of this step, they were content to proceed by separate enactments intended to weaken the power that had been gained to the papal see by the concordat. With this end in view three measures were brought forward, one for the re-establishment of civil marriage, one for the emancipation of the schools from the domination of the Church, and one for the placing of the different creeds on a footing of equality. Before 25 May 1868, all these measures had passed through both houses of the diet, and on

AUSTRIA

that day they received the imperial sanction. These laws were declared by the Pope to be "abominable," as well as null and void. Further enactments having in view the weakening of the power of the papal see in the state were passed in 1874, and were condemned by the Pope in the severest terms. The fact of the Austro-Hungarian dominions comprising so many different nationalities with different languages has always given the government much trouble, both in the management of internal affairs and in regard to external matters. In the recent revival of the Eastern question, for instance, the course of Austria was hampered by the sympathy shown by the Magyars for the Turks, while her Slav subjects were naturally more favorable to Russia. Previous to the outbreak of hostilities between Russia and Turkey she joined with the other powers in remonstrance with Turkey, but as to the actual struggle remained neutral. At the close of the war in the middle of 1878 Austria took part in the Congress of Berlin, where the settlement of the Eastern question was arranged, and by this congress it was decided that the provinces of Bosnia and Herzegovina should in future be administered by Austria-Hungary instead of Turkey. Since then the external history of the monarchy has been uneventful, but there has been considerable friction at home between the different nationalities and political parties.

Area and Divisions.—The Austrian empire extends from about lat. 42° to 51° N, and from lon. $8^{\circ} 30'$ to $26^{\circ} 30'$ E, the total area in round numbers is 240,000 square miles. Its greatest length from east to west is about 860 miles; its greatest breadth about 400 miles. It is bounded south by Turkey, the Adriatic Sea, and the kingdom of Italy; west by Switzerland, Bavaria, and Saxony; north by Prussia and Russian Poland; and east by Russia and Rumania. On the shores of the Adriatic, along the coasts of Dalmatia, Croatia, Istria, etc., lies its only sea frontage, which, compared to the size of the monarchy, is of insignificant extent. Besides being divided into the two great divisions above mentioned, the Austro-Hungarian monarchy is further divided into a number of governments or provinces. The following table exhibits the name and area of these governments, with their population in 1890 and 1900:

Natural Features.—Although presenting every variety of surface the prevailing character of the Austrian dominions is mountainous, there being few districts where mountains are not found; while the plains do not occupy more than a fifth part of the whole superficies. The loftiest ranges, and the most extensively ramified, are found in Tyrol, Styria, Illyria, and the southern parts of Austria proper. In some of these regions the scenery is bold and romantic, and has been considered equal to that of Switzerland. The most extensive tracts of low or flat land occur in Slavonia and the southeast and central parts of Hungary; much of this level land is remarkably fertile, but it is met at various points by vast morasses and arid steppes. The principal valleys are found in Tyrol, Salzburg, Styria, and Illyria. Extensive plains stretch along the courses of the rivers, particularly the Danube, the Theiss, and the March. The principal rivers of Austria are the Danube, the Elbe, the Save, the Drave, the Waag, the March, the Inn, the Teiss or Theiss, and the Maros. The Danube for upward of 800 miles is navigable for quite large vessels throughout the whole Austrian territory; while all the others, most of them tributaries of the Danube, are navigable for vessels of smaller size. All the rivers abound in fish. The lakes are numerous and often picturesque, although those in the lowlands, particularly in the plains of Hungary, are rather marshes than lakes. Austria lies between the isotherms of 60° and 50° , and has a climate nearly as various as its surface. The northern regions, between the 49th and 51st degrees of north latitude, have an average temperature resembling that of the north of France. Between lat. 46° and 49° the heat is considerable; and between 42° and 46° , which comprises the whole of South Austria, it is still greater; the winter lasting two or three months only, and being, in general, extremely mild. The principal products of the north are wheat, barley, oats, and rye; in the centre, vines and maize are added; and in the south, olives. The productive capabilities of the soil, however, are not rendered available to their full extent. The wines of Austria are inferior on the whole, with exception of a few choice kinds, including the well-known Tokay. A great portion of the

AUSTRIA

worst wine is made into brandy. The average produce of wine is about 540,000 gallons, of which Hungary yields by far the largest proportion. The forests cover 69,000 square miles, or one third of the productive soil of the empire, and yield timber of excellent quality, adapted for all purposes. Wild deer, wild swine, chamois, foxes, lynxes, and a species of small black bear, are found in many districts, the fox and lynx being particularly abundant. Herds of a native breed of horses, of small size, roam wild over the plains of Hungary. All the domestic animals of England are known throughout the empire. A large portion of the countries now composing the Austrian empire was at one time submerged by the sea, particularly Hungary, where the general appearance of its vast plains, the nature of their soil, and, above all, the occurrence of fossil sea shells, leave no room to doubt the former dominion of the ocean. Throughout all Austria the Tertiary formation prevails, with a margin of the Secondary formation, stretching to a greater or lesser extent into the surrounding countries, and diversified by patches of igneous rocks of the Tertiary and Alluvial epochs. In mineral productions Austria is very rich, possessing, with the exception of platinum, all the metals. We may more particularly mention gold, silver, iron, copper, lead, zinc, quicksilver, coal, and salt. The total annual value of the mineral products of the Austrian empire is estimated at upward of £12,000,000; of which £2,300,000 represents coal; £2,000,000 lignite; £4,300,000 smelted ores; and £3,400,000, salt.

Manufactures and Commerce.—Manufactures are in the most flourishing condition in Bohemia, Moravia, Silesia, and Lower Austria; less so in the eastern provinces, and insignificant in Dalmatia, Bukowina, and the military frontiers. The total money value of manufactured products amounts to at least £130,000,000, the value of agricultural products to more than £200,000,000. As regards the individual branches of manufacture, there are machines produced yearly to the value of £4,000,000 to £5,000,000, and the supply about equals the demand. In the manufacture of musical and scientific instruments Austria holds a high position; those of Vienna are especially celebrated. The manufacture of stoneware and chinaware is very extensive, being valued at about £2,500,000 yearly, and giving rise to a brisk export trade. The glass manufacture is one of the oldest and most highly developed branches of industry in Austria. The manufactories, about 200 in number, are spread over the whole of the monarchy, but are most numerous in Bohemia, where glass and glasswares of every kind are produced. The yearly value of this class of manufactures is estimated at about £2,500,000, of which a very considerable quantity is exported. The manufacture of metal goods is carried on to a great extent, being valued at about £10,000,000; and some of the iron and steel goods, such as scythes and reaping hooks, have a world-wide reputation. The manufacture of gold and silver plate and jewelry is also important, and the articles of Vienna workmanship compete successfully with the French. The production of chemicals reaches the amount of £5,000,000, and about covers the home demand. As regards articles of food, the sugar from beets has an annual value of about £12,000,000; of beer the produc-

tion is £4,000,000 in value, the number of breweries is over 2,000; spirits are distilled to the value of £3,500,000. The manufacture of tobacco is a state monopoly, and is carried on in 38, mostly large, establishments. Of textile industries, the silk manufacture, since the loss of the Lombardo-Venetian provinces, has become greatly limited. The manufactures of woolen, hemp, and flax are among the oldest and most important of the state. The first gives employment to about 400,000 persons, and turns out about £14,000,000 worth of goods yearly, of which a considerable proportion is annually exported. In the whole monarchy there are about 650,000 spindles and 65,000 looms employed in woolen weaving. The linen manufacture (including also hemp and jute) gives employment to a greater number of persons than any other branch of industry (many of them in their homes), and produces goods to a greater value. The chief seats of the manufacture are Bohemia, Moravia, and Silesia. The annual produce of the cotton manufacture is next in value to that of woolens. Although about 2,400,000 spindles are in activity, cotton yarn has to be imported. On the other hand, however, excellent cotton cloths are exported. Tanning is carried on to the greatest extent in Moravia, Lower Austria, and Bohemia, yet not sufficiently to supply the demand. The manufacture of leather goods, however, is very large, and in the production of gloves (in Vienna and Prague) Austria stands next to France. Altogether the manufacture of leather and leather goods employs about 200,000 persons and produces goods to about £10,000,000 yearly.

In addition to the general import and export trade, Austria carries on,—partly from its central position in the continent of Europe, and partly from its numerous navigable streams, excellent roads, and in later times its partially completed railway system,—a very considerable amount of business in the transit of goods through her territory to other countries. In 1887 the total value of the imports into Austria-Hungary was, in round numbers, £53,900,000, while the value of the exports was £69,860,000; the respective figures for the year 1897 were £62,940,000 and £63,854,000. These values were exclusive of coin and bullion, the import of which into Austria-Hungary in 1897 amounted to £8,322,000, while the export for the same year was £4,304,000. The principal import is raw cotton, which was imported in 1897 to the value of £4,225,000; wool being imported to the value of £3,209,000; cotton and woolen yarn to the value of £2,433,000; silk and silk goods to the value of £2,725,000; coffee to the value of £2,192,000; tobacco leaf and manufactured to the value of £2,167,000; coal and coke to the value of £3,100,000. Among the other chief articles furs and hides were imported to the value of £1,842,000; leather was imported to the value of £1,783,000; machinery, locomotives, etc., to the value of £1,642,000; hardware and clocks to the value of nearly £1,000,000; books, newspapers, and maps to the value of £1,492,000; grain to the value of £3,400,000; cattle to the value of £1,300,000. Wood formed the chief article of export, the value of this product being in 1897 £7,000,000; next came sugar, value £5,120,000; cattle to the value of £3,800,000. Among other exports of importance were grain to the value of £3,475,000; leather and leather

AUSTRIA

wares (including gloves), £2,242,000; hardware, £1,533,000; eggs, £3,660,000; coal and coke, £2,850,000; woolen manufactures, £1,542,000; glass and glassware, £1,867,000; paper and paperwares, £909,000; wool, £883,000; malt, £2,042,000; wooden goods, £1,600,000; hides, etc., £1,420,000. Nearly one half of the commerce of Austria is carried on with Germany, the next places being occupied by Great Britain, Italy, Russia, and the United States. Including fishing vessels and small craft, Austria-Hungary, in the beginning of 1897, had 12,447 vessels of all sizes, with a tonnage of 270,250, and employing 34,431 men. Of these 227 of 212,069 tons were sea-going vessels, the coasting vessels being 1,739 in number with a tonnage of 35,515. The principal ports of the empire are Trieste, Pola, and Fiume. In 1898 there were 20,445 miles of railway open for traffic in the empire, of which 10,598 were in Austria, and 9,847 in Hungary.

Money, Weights, and Measures.—On 1 Jan. 1900 a new monetary system went into effect, the coinage being changed from a silver to a gold basis, and the standard coin and money of account being the crown (equal to 20.3 cents in United States gold). Practically the chief medium of exchange is banknotes, of various denominations. The Austrian centner, the weight by which all large quantities are rated, is 123½ pounds avoirdupois. The metze (pl. metzen), the largest dry measure=17 of a bushel, or somewhat less than the fourth part of an English imperial quarter, nine metzen making two quarters nearly. The eimer, the most generally used liquid measure, is equal to 14.94 English wine gallons. The Vienna foot is equal to 12.45 inches English. The joch of land is 1.43 English acre.

Population—None of the European states, with the exception of Russia, exhibits such a diversity of race and language among their population as does the Austrian empire. The Slavs, who amount to above 19,000,000, or 45 per cent of the total population, are the chief of the component nationalities of the monarchy in point of numbers, forming the great mass of the population of Bohemia, Moravia, Carniola, Galicia, Dalmatia, the kingdom of Croatia and Slavonia, and Northern Hungary, and half the population of Silesia and Bukowina. This preponderance, however, is only apparent, as none of the other races are split up into so many branches differing so greatly from each other in language, religion, civilization, manners, and customs. These branches are the North Slavic Czechs, Moravians, and Slovaks, the Ruthenians and Poles, and the South Slavic Slovenians, Croats, Serbs, and Bulgarians. The Germans, about 10,570,000 in number, are scattered over the whole monarchy and form almost the sole population of the archduchy of Austria, Salzburg, the greatest portion of Styria and Carinthia, almost the whole of Tyrol and Vorarlberg, considerable portions of Bohemia and Moravia, the whole of the west of Silesia, etc.; and they are also numerous in Hungary and Transylvania. The Magyars or Hungarians (7,440,000 in number, or about 16 per cent of the total population) form the great bulk of the inhabitants of the kingdom of Hungary and of the eastern portion of Transylvania. To the Italic or Western Romanic stock belong the inhabitants of South Tyrol and parts of the coast lands and Dalmatia, numbering about 700,000 in all. A

considerable portion of the southeast of the empire is occupied by members of the Rumanian (or Eastern Romanic) stock, who number altogether about 2,800,000, and form more than half the population of Transylvania, besides being spread over the southeastern parts of Hungary, Bukowina, and part of Croatia and Slavonia. The number of Jews is also very considerable (above 1,000,000), especially in Galicia, Hungary, Bohemia, and Moravia. There are also several other races whose numbers are small, such as the Gypsies (95,000), who are most numerous in Hungary and Transylvania, and the Albanians in Dalmatia and neighboring regions. The population is thickest in Lower Austria, Bohemia, Silesia, and Moravia; thinnest in Salzburg. Generally speaking, it decreases in density from west to east.

Religion.—The state religion of Austria is the Roman Catholic, and next in numbers is the Greek Church. Calvinism and Lutheranism are also professed by a large body of the people; the former mostly in Hungary and Transylvania, the latter in the German provinces and in Galicia. The civil power exercises supreme control in all ecclesiastical matters, the emperor being, in everything but name, head of the Church; and as no sentence of excommunication, or other ecclesiastical edict, can be issued without the sanction of the Crown, the Pope's direct authority in Austria is somewhat limited. In 1890 there were in the Austrian portion of the monarchy 18,784,063 Roman Catholics, 2,797,089 Greek Catholics united to the Roman Church, 540,715 non-united, 430,849 Protestants, and 1,135,118 Jews. In Hungary and Transylvania there were 8,823,105 Roman Catholics, 1,670,283 Greek united and 2,633,491 non-united, 3,427,806 Protestants, and 724,588 Jews.

Education.—The intellectual culture of the people is at very different stages of advancement among the different races. It is highest in the German provinces and lowest in the east. In Upper and Lower Austria, Salzburg, Tyrol, Moravia, Silesia, and Bohemia, almost all the children of suitable age are in attendance on the public schools; while in Bukowina only about 34, and in Galicia about 59 per cent of them are at the schools. The educational system has been entirely remodeled in recent times. The elementary schools, or those in which the common branches are taught, are designated national schools or schools for the people (*Volksschulen*), and there children have to attend from the end of their 6th to the end of their 14th (in some provinces only their 12th) year. A higher class of elementary schools are known as town schools (*Burgerschulen*), in which a superior education may be obtained. For the training of instructors for the people's schools, there are 43 normal schools for male teachers and 26 for female. As secondary schools or institutions of a more advanced grade, there are the gymnasias and the "real-schools," as they are called. The gymnasias resemble the best sort of our grammar schools, being intended chiefly to prepare pupils for the universities, great attention being paid in them to the classical languages. In the real-schools a more practical end is kept in view, and modern languages and physical science form the groundwork of the educational course. A complete course in a gymnasium extends over four years, in a real-school either three or four. There

AUSTRIA

are also schools of an intermediate stamp known as "real-gymnasias." The higher education is provided for by the universities, the polytechnic institutes, and the various institutions in which particular subjects are taught. There are 11 universities in the monarchy, namely, in Vienna, Prague (two—a German and a Bohemian), Pesth, Gratz, Cracow, Lemberg, Innsbruck, Klausenburg, Agram, and Czernowitz. Most of these have four faculties—Catholic theology, law and politics, medicine, and philosophy. There are also several technical high schools in which mathematics, physics, and natural science are the chief objects of study. Besides these there are theological institutions; schools for jurisprudence and philosophy; schools of commerce, industrial arts, agriculture, arboriculture, and mining; military schools, naval schools, art schools, conservatories of music, etc. The principal libraries are the royal library at Vienna, with 450,000 volumes, 24,000 manuscripts, and 7,000 incunabula; and the university libraries of Vienna and Prague.

Constitution, Revenue.—As already mentioned, the Austrian dominions now consist of a German, or Slavo-Germanic, or Cisleithan empire, and a Transleithan or Hungarian kingdom, each with its own parliament, ministers, and government. The same hereditary sovereign rules over both, and they have a common army and navy, and a sort of common parliament known as the Delegations. The Delegations consist of 120 members, one half of whom are chosen by and represent the legislature of German Austria, and the other half that of Hungary, the upper house of each legislature returning 20 and the lower house 40 deputies. In all matters affecting the common affairs of the monarchy the Delegations have a decisive vote, and their resolutions do not require the confirmation of the representative assemblies in which they have their source. The Delegations meet alternately in Vienna and Budapest. Their ordinary mode of procedure is to sit and vote in two chambers, the 60 deputies of Cisleithan Austria forming the one, and the 60 of Hungary the other. But if no agreement can be arrived at in this manner, the two bodies must meet together and without further debate give their final vote, which is binding for the whole empire. The jurisdiction of the Delegations extends specially to all matters affecting foreign affairs, war, and finance. The constitution of German Austria was finally established in December 1867. The provinces have each a diet or legislature of their own for provincial affairs, these diets being 16 in number, one each for Bohemia, Dalmatia, Galicia, Upper Austria, Lower Austria, Salzburg, Styria, Carinthia, Carniola, Bukowina, Moravia, Silesia, Tyrol, Vorarlberg, Görz and Gradisca, and Istria, the municipal council of Trieste having similar functions. The provincial diets are composed of the archbishops and bishops, the rectors of the universities, the representatives of the great estates, of towns, of boards of commerce, of rural communes, etc. The laws passed in these diets have reference to provincial taxation, agricultural, educational, and other matters. The national parliament or legislature of German Austria, called the *Reichsrath* (or council of the realm), consists of an upper house or house of lords (*Herrnhäus*), and a lower house or house of deputies (*Abgeordnetenhaus*).

The former is composed of princes of the imperial family, of nobles whose families have a hereditary right to this dignity, of the archbishops, the bishops of princely rank, and of a certain number of life members nominated by the emperor. The lower houses consist of 353 members, elected by all citizens above 24 possessing a small property qualification. The rights belonging to the Reichsrath are: consent to all laws relating to military service; co-operation in the legislation on commercial matters, customs, railways, etc.; and examination of the estimates of the income and expenditure of the state, and other financial matters. The constitution of Hungary, including also Croatia, Slavonia, and Transylvania, dates from the foundation of the kingdom, or about 895 A.D. It rests upon a number of statutes published at long intervals, the principal of these being the *Bulla Aurea* or Golden Bull of Andrew II, granted in 1222, by which the government was defined as an aristocratic monarchy. The legislative power is vested in the king and the parliament (*Reichstag*) conjointly. The latter consists of an upper house or house of magnates, and of a lower house or house of representatives. The house of magnates consists of the archdukes of the imperial family who have attained their majority, 54 ecclesiastical dignitaries, 151 counts, and 36 barons as hereditary members, 84 life members nominated by the sovereign, or elected by the chamber, etc. The lower house (of 453 members) is composed of elected representatives. The Hungarian Reichstag corresponds to the Reichsrath of the Cisleithan provinces, and accordingly only deals with such matters as are common to the provinces belonging to the Hungarian crown. Transylvania is, so far as legislation and administration are concerned, entirely incorporated with Hungary. Croatia and Slavonia, however, have a Landtag or diet of their own, which, like the provincial diets of the Cisleithan portion of the empire, consists of only one chamber, and which is competent to deal with all matters belonging to the interior administration of the provinces, with religion and education, and with the administration of justice. Fiume, which was formerly associated with Croatia and Slavonia, and subject to the Landtag of these provinces, has, since August 1870, been put directly under the central Hungarian government.

There being three distinct parliaments in the empire, there are also three budgets, namely, that for the whole empire, that for Cisleithan, and that for Transleithan Austria. In the budget of the whole empire for 1902 the revenue and expenditure were each estimated at 365,181,966 crowns; in that for Cisleithan Austria the revenue was estimated at 1,685,966,357 crowns, and the expenditures at 1,685,117,944 crowns; and in that for Transleithan Austria the estimated revenue was 1,086,870,018 crowns, the estimated expenditure being a little less. A small portion of the imperial revenue of Austria is derived from customs and other sources, and the remainder is made up by the two divisions of the empire, 70 per cent thereof being contributed by the Cisleithan and 30 per cent by the Transleithan portion.

Recent Politics.—Austria to-day is what Metternich with less truth called Italy, little more than a geographical expression. Three bonds do indeed unite its discordant nationalities; but

AUSTRIA

for the hasty observer the country might well seem in the last stages of decomposition. There is nothing really Austrian in Austria—no Austrian interests, no Austrian language, or literature, or patriotism, no Austrian nationality, no Austrian standard of civilization; nothing except the emperor, and the army, and the cockpit of the Reichsrath that the races share in common. The Germans form a compact entity by themselves in Upper and Lower Austria and the Duchy of Salzburg. In Bohemia there is a respectable colony of them along the borders of Saxony and Bavaria, over 2,000,000 strong, but even so they are outnumbered by the Czechs in the ratio of 3 to 5. All together the German-speaking subjects are about a third of the total population of Austria—some 8,500,000 out of 24,000,000. The Czechs in Bohemia, Moravia, and Silesia number roughly 5,000,000. In Galicia some 4,000,000 Poles hold down a trifle over 3,000,000 Ruthenians. A couple of million Slovenes, Servians, and Croats are scattered over Carinthia and Carniola, while nearly 1,000,000 Italians inhabit the Tyrol. None of these races can alone be said to represent Austria, though all of them claim to; and their mutual wranglings, struggles to realize themselves, struggles to elbow out their neighbors and seize an incontestable ascendancy, are the background, and at times something more, of modern Austrian politics. But for the dashing tenacity of the Magyars, Hungary might be as heterogeneous as her partner in the dual monarchy. The Magyars are only 7,500,000 out of nearly 18,000,000, but they are a race with the fierce hardihood and determination of the Teutonic stock and a grace and fascination that are neither Latin nor Celtic, but distinctively their own. Since the two nations entered into a partnership agreement as coequal and sovereign states, the Magyars have devoted all their brilliant energies and the immense force of a concentrated one-idealness to making themselves paramount throughout the southern half of the realm. They revolted against being Germanized, but see no inconsistency in insisting that the Servians, Croats, Rumanians, and Slovenes shall be Magyarized; and they have set about the task with unsparing persistency just saved from relentlessness by their genius for wise compromise. A restricted suffrage, excluding nineteen twentieths of the people from the polls, keeps public affairs in their grasp. The schools have been a much more effective instrument in the development of a national feeling, and the Magyars have thoroughly worked them to that end. Like the Russians and Americans, but unlike the English, the Magyars recognize that where there is difference of speech there will be difference of sentiment, of heart, of interests, and at a pinch perhaps of loyalty, and have accordingly refused to make the preservation of dialects an object of government. Fifty years ago the Hungarian nobles spoke German and a bastard monkish Latin in their homes and diets. To-day the native tongue obtains, among all classes, and the absorption of all manner of outlanders,—German, Slovacks, Jews, Rumanians, and Croats,—by the irresistible and peaceful process of denationalization in the schoolroom, has gone on at such a pace that the Magyars increase nearly three times as quickly as any of the neighboring races. The struggle of the nationalities in Hungary has ended

in a more or less resigned acquiescence in Magyar rule.

In Austria, as in Spain, the factory is placed some distance behind the barracks as an element of national welfare, and a contemptuous bureaucracy shackles trade with a hundred entangling regulations. The Magyars, on the other hand, have been as attentive to commerce as to their racial position. Perhaps there is no country in which the state, as such, has done more for industrial development. The really vital domestic problems of Hungary are, indeed, no longer racial, and as freedom of worship is the law, they have never been acutely religious. But in the rise of what is called Agrarian Socialism, there is something that may test Magyar statesmanship severely. Meanwhile the Magyars are the backbone of the dual monarchy. Against the rising tides of Pan-Slavism they present a compact and unbending front. Together with the German empire they may be considered the outposts of Europe against Slav aggression; and even in the domestic affairs of the monarchy their unbreakable unity as a political force has made their influence well-nigh decisive. The *Ausgleich* of 1867,—the partnership agreement between the two halves of the realm,—prescribed that matters of common concern, such as foreign affairs, diplomatic representation, and naval and military matters, should be arranged by 60 delegates from each country, meeting twice a year. The Austrian delegation is made up of Germans, Czechs, Poles, Ruthenians, Italians, whose feuds make steady co-operation all but impossible. The Hungarian delegation, on the other hand, is composed of 55 Magyars and 5 Croatsians, working with the directness and harmony of a single man. The consequence is that in the long run the Hungarian view is fairly sure to carry the day. So far each renewal of the *Ausgleich* has brought substantial modifications in favor of Hungary, and the centre of gravity has, in fact, shifted from Vienna to Budapest. The emperor, when driven to it, might go against the German-speaking Austrians, but never against the Magyars; and the Magyars, fully realizing their power, have extorted concession after concession from their unhappy partner; have applied the screw so persistently, that it is becoming a question whether they are not as unpopular among Austrian statesmen as the very Czechs themselves. The troubles of the dual monarchy are due to the failure of the Germans to repeat in Austria the successes of the Magyars in Hungary. "You look after your hordes," said Count Beust to a Hungarian statesman when the Austrian empire became the dual monarchy, "and we'll look after ours." The Czechs of Bohemia have turned to ridicule the count's too valiant declaration. The Germans of Vienna, one must remember, are very different from the Germans of Berlin. Of all the sections of the Teutonic race they appear to have the least robustness of intellect or character and the laxest grip on practical affairs. Indolent, hypercritical, and self-satisfied, they are the emasculated editions of their northern kinsmen. From whatever cause, some paralyzing blight of lassitude and ineffectiveness seems to have eaten its way into their energies. Against their cultured fecklessness the Czechs oppose the elemental force of racial ambition, the driving power of a people that has the conscious-

AUSTRIA

ness of a great destiny before it and feels itself on the top of the rising wave.

The Germans protest that they have educated themselves beyond the point where race is everything and cannot at this time of day be expected to return to first principles. It is of course tenable that the variety of parties into which the Germans are split up argues an advanced and broad political intelligence. At the same time it makes a poor barrier against the impact of a race that subordinates everything to a single practical end; and unless the Germans are prepared to see a great part of their old ascendancy pass away, they must be ready to drop "theorizing," take up the issue that has been forced upon them, and meet their antagonists with weapons not necessarily of their own choosing. In other words, they need simplifying if they are to combat the Czechs successfully. As it is, the Czechs for the last 30 years have been slowly driving them to the wall. City after city has fallen into their hands; Prague and Pilsen, that only a quarter of a century ago were German in tongue and sentiment, are now Slavonized down to their very street names. And in politics and industry as well as music and literature and the lighter arts, the past hundred years have seen the Czechs advance in a quite wonderful fashion. They have long ceased to fear the Germans, and with the disappearance of fear comes naturally the claim to equality. Moreover, the Czechs have a strong historical case. Four hundred years ago what are now the crown-lands of Bohemia, Moravia, and Silesia formed the Czech kingdom of St. Václav; and what is now Hungary was then the kingdom of St. Stephen. The Czechs offered their crown in 1526 to the Hapsburgs, at the same time, for the same reasons, and on the same conditions as the Magyars; stipulating only that they should retain their old rights of self-government. This contract, together with the Pragmatic Sanction, was the legal basis of the Hungarian rebellion of 1848. The Czechs still use it to point the justice of their demands for a resurrection of St. Václav's kingdom, maintaining that their case is on all fours with that of Hungary, rests on the same documents, and is supported by the same coronation oaths. The Hapsburgs never quite lived up to their side of the agreement. They allowed the Turks to overrun Hungary at will, and when the Reformation came and the Czechs gathered round John Huss, they stamped out the heresy in blood and established a strong German colony along the northern borders of Bohemia for the protection of the faith and the suppression of the natives. The Czechs have kept their native tongue alive, and just across their borders are their kinsmen of the Russian empire. The card of Russian sympathy is often played, and after every fresh frustration of their national hopes follows the spectacle of 5,500,000 Czechs cautiously sounding the Czar's "racial instinct." It is this that lends color to the common charge that the Czechs are disloyal, but it is to be noticed that when the situation is reversed and the emperor makes even the shortest step toward Home Rule, the Germans at once adopt their opponents' tactics, throw themselves into the arms of their Prussian brethren, and vow that sooner than stay and be swamped by a hated and inferior race, they would willingly exchange the Hapsburgs for the

Hohenzollerns and enroll themselves among Kaiser Wilhelm's subjects. The suspicion cannot be avoided that these dramatics are at bottom intended for home consumption, and that the tune would be quickly changed if the czar or kaiser were to listen too seriously.

The whole history of the dual monarchy goes to show that real consolidation and unity can be effected only by the seemingly paradoxical method of allowing each nationality the widest possible freedom. Justice toward and equal treatment of all races is the only sure road to peace and permanency. It is a hard one for the Germans to tread, for it means the overthrow of an ascendancy once paramount in every corner of the realm; but unless universal suffrage brings to the front an entirely new set of problems, that it must be. The interplay of these racial ambitions has been complicated, sometimes retarded and sometimes acutely emphasized by a hundred differences of religious, economic, and purely political interests, all of which have representatives in the Reichsrath. They act upon one another under the shadow of the racial issues in a way that no foreigner can disentangle. The confusion of the country is worthily reproduced in the 15 distinct parties and the seven or eight languages that crop up in the Vienna parliament. Austria-Hungary is a polyglot chaos in which even Austrians do not profess to see more than a half light. The prophecies of disruption may therefore appear at least plausible. But it is one of the many paradoxes of the dual monarchy that it seems unable to break up. In part it is protected by the very diversity and number of the antagonisms it is obliged to house. A more visible bond of union is the army, in which all must serve, which is of all races and creeds, and therefore of none, and the atmosphere of which is broadly and impressively imperial. What its actual effectiveness will prove to be like, should it ever be tested, is one of the most interesting military problems of the day. The only force with which it can be compared in the excellence of its units and the variety of its nationalities and tongues is the allied army that rescued the Pekin legations; and the parallel is not altogether hopeful. A polyglot army must of necessity be to some extent a disorganized army, and while the forces of the dual monarchy use German as the language of military command, the rank and file and the bulk of the officers retain their own speech for general purposes. The heterogeneous character of its composition has had a steadying influence on the internal struggles of the dual monarchy, however much it may hamper its efficiency on the battlefield. The army has kept itself largely aloof from politics, and though the Czechs did once attempt to transfer the racial bitterness to the parade ground by answering the roll-call in their own tongue, a sharp rebuke from the emperor was enough to bring them to reason.

A second and equally powerful bond of union is the monarchy. Not only is it accepted everywhere, but the idea of upsetting it in favor of any other form of government has never yet been broached. Even the Kossuth irreconcilables, who would like to see the *Ausgleich* abolished and Hungary direct her own fiscal policy,—a quite possible development,—and manage her own foreign affairs, still do

AUSTRIA

not propose to sever the personal tie that binds the two countries. And not only is the monarchy secure in the affections of the people, but the dynasty is equally popular. So long as there is a throne it is not conceivable that any one but a Hapsburg should occupy it. This two-fold devotion to monarchy and to the dynasty has been greatly strengthened of late years, partly by the breakdown of parliamentary government and the weariness which has made the people look to the throne as an escape from the turmoil and wranglings of small groups, and partly through the patience and wisdom, the sterling fair-mindedness and competency of the present emperor, as well as the ghastly tragedies of his private life. But it is a curious delusion to argue that just because Francis Joseph is so adequate and well beloved, and comes so near to the ideal of what a constitutional monarch should be, therefore the empire must go to pieces when his moderating and persuasive influence is withdrawn. Such a reign as his is far more than a merely personal triumph; it is the consecration of a system; it exalts the monarchy as well as the monarch, and it smooths out the path for his successors by bequeathing to them an office made more illustrious by his example and memory, more powerful and more deeply based in the hearts of the people. So far from being a signal for dismemberment, the close of the present emperor's reign is more likely to witness a splendid rally round the house and throne of the Hapsburgs. The general peace of Europe would indeed be jeopardized in the event of a scramble for the fragments of the dual monarchy. But no such catastrophe is likely, for the reason that it is to no one's interest to bring it about. It is not for secession from, but for the fullest liberty within, the empire that "the numerous nationalities involved" are struggling. The only genuine secessionists are Herren Wolf and Schonerer and their followers, who wish to incorporate German-speaking Austria with the German empire. It is possible that their wishes may ultimately be gratified, but not in our time, not till after the next European war, if even then, and not till the clericalism of Austrian Germans has considerably toned down. What the Czechs and the other races want, is the same independence as the Magyars possess, and such independence is as inconsistent with Russian as with German domination. It is against their interests to break away from the Hapsburgs. The day of small states has gone by, and a lonely Czech kingdom could not exist for a year by the side of Russia.

Army—Military service is obligatory on all citizens capable of bearing arms who have attained the age of 20, and lasts up to the age of 42, either in the active army, in the landwehr, or the landsturm. The period of service in the active army is 12 years, of which three are passed in the line, seven in the reserve, and two in the landwehr. In 1900 the standing army numbered 361,693 men (including officers) on the peace footing, and 1,826,940 men and 45,238 officers on the war footing.

Navy—On account of the recent development of the Italian navy, Austria has found it necessary for her self-defense to have a fleet of her own, and the last ship of a new squadron was launched in 1904. The new ships are remarkable for their armament and speed, and

will compare favorably with any equal number and size of ship in the world. Leaving out the ships constructed prior to 1887, the new fleet is composed of two battleships, the *Erzherzog Friedrich* and the *Erzherzog Karl*, of 10,600 and 10,100 tons respectively, and 19.25 knots speed. Each will carry four 9.45-inch Skoda guns of 40 calibres and twelve 7.48-inch of 42 calibres. The first will have in addition fourteen 2.75-inch and the other 2 of the same calibre, each being furnished with a full complement of small bore quickfirs. The 7.48-inch guns will fire four rounds a minute.

The next division is composed of three ships of 8,300 tons each, named the *Habsburg*, *Babenberg* and *Arpad*. Their speed is 18.5 knots, and the armaments three 9.4-inch and twelve 6-inch guns each, besides the usual complement of small calibre quickfirs.

Then comes a division of three coast defence ships, the *Monarch*, *Wien* and *Budapest*, of 5,600 tons each and 17 knots speed. Their armament of four 9.4-inch and six 5.9-inch each, with fourteen smaller calibre quickfirs, is extremely formidable for their size, and it is well disposed and protected, entitling them to be reckoned as battleships.

The cruisers of the Austro-Hungarian navy are, in order of size, the *Kaiser Karl VI.*, of 6,250 tons; the *Maria Theresa*, of 5,370; and the *Kaiser Franz Joseph I* and *Kaiserin Elizabeth*, of 4,060 tons each. Each carries two 9.4-inch guns; the first two eight 6-inch quickfirs; and the last two six 6-inch quickfirs each, with numerous small calibre pieces. Their speed is between 19 and 20 knots, and they hold a place between armored and protected cruisers.

Two ships classed as battleships, launched in 1887, the *Erzherzog Rudolf* of 6,900 tons and the *Erzherzogin Stefanie*, of 5,100 tons, may be added to the effective squadron and would raise it to fourteen vessels. Their armament is sufficiently powerful, consisting of three and two 12-inch, six 4.7-inch and six 6-inch guns respectively, with two 2.75-inch pieces each. Their speed is 16 knots.

There are three small cruisers of 2,300 tons each, the *Zenta*, *Jaguar* and *Aspern*; and three torpedo cruisers, of 1,600 to 1,700 tons each, the *Panther*, *Leopard* and *Tiger*. The seven torpedo boat destroyers, range from 310 to 610 tons, of 21 knots speed, and there is a small torpedo boat flotilla, which is being increased. Experiments are also in progress with submarines.

The personnel of the Austro-Hungarian navy is excellent, and should the squadron it can turn out ever be called on to act alone or as part of the naval force of an alliance, it can be relied on to give a good account of itself.

Judiciary.—The courts of first instance comprise 940 *Bezirksgerichte*, county courts, and 71 *Landes und Kreisgerichte*, provincial and district courts; *Geschworenengerichte*, or jury courts being connected with the latter. These courts act as courts of inquiry and have summary jurisdiction. The courts of second instance, or courts of appeal from the lower courts, having the supervision of the criminal courts, comprise 9 *Oberlandesgerichte* or higher provincial courts. There are also special tribunals for military, revenue, shipping, and other matters, including four industrial courts and three commercial courts. The *Oberste Gerichts und Kassationshof*, Supreme Court of Justice and Court of

AUSTRIAN SUCCESSION — AUTOMATISM

Cassation, at Vienna, is the final court of appeal. The High Court of Administrative Affairs decides differences between private individuals and public officials, and the Reichsgericht, or Court of the Empire, the conflicts of law and jurisdiction between different authorities.

Austrian Succession. See SUCCESSION WARS.

Au'thors, British Society of, an association of authors formed in London in 1883, for social and business purposes. It has a governing committee of 30 members; maintains an attractive club-room and publishes a periodical called 'The Author.' The late Lord Tennyson was its president till his death.

Au'thors Club, an American organization founded in New York in 1882, and incorporated in 1887. It is governed by an executive committee without a president. Any person who is the author of a published book proper to literature, or of creditable literary work equivalent to such a book, is eligible to membership. The club holds meetings semi-monthly, and gives Saturday receptions for ladies in the winter season. It has a library consisting of the publications of its members and another devoted to literary biography.

Au'thors, French Society of, an organization founded in Paris in 1837, for the protection of authors in their rights, and open to any man of letters. It is governed by an elective committee of 24 members, and has a pension fund which provides for aid in work, for sickness and in old age. Besides publishing a journal, the 'Chronique,' the society has collected a large sum of money from pirating publishers.

Au'thors, American, Society of, an organization founded in New York in 1892, and incorporated in 1895, having for its objects the promotion of a professional spirit among authors and a better understanding between authors and their publishers, and, in general, the protection of literary property and the advancement of the interests of American authors and literature. All persons engaged in literary pursuits are eligible to membership. The society has a pension fund for members who may become needy.

Auto de fe, ow'tò dá fā (Spanish); **Auto da Fe** (Portuguese), lit. "act of faith." See INQUISITION.

Auto-intoxication, a poisoning of the body by its own products. In the complicated processes that make up the sum total of human metabolism many products are formed which if not modified in some manner would poison and kill the body. The simplest illustration of this is seen in the function of respiration, in which the carbon dioxide in the venous blood is oxidized in the lungs and thus eliminated. The urine

contains a number of bodies which if prevented from leaving the body would cause its death. Thus auto-intoxication may result from the normal products elaborated in the body if these are not modified, or are prevented an outlet. But the problem of auto-intoxication is much more complicated in many of its manifestations. Sick-headache, gout, diabetes, many neuralgias, Addison's disease, myxedema, acromegaly and many other obscure diseased conditions are known to be due to some form of perversion of the normal processes of metabolism and are instanced as forms of auto-intoxication. The general organs of defense in the constant play of these factors may be divided into two general groups, (1) those that have the function of transforming by chemical means many of the poisonous products of the normal metabolism of the body, and (2) those organs that are chiefly concerned in the elimination of these products. To the first group belong the liver, the mucous membranes, the thyroid, lymphnodes, the adrenal glands, the blood cells, the blood serum and the lymph. In the second group are the kidneys, the lungs, the skin, and the intestines.

Classification.—Auto-intoxication may result (1) from the failure of functions of certain organs having a definite chemical function. Pancreatic diabetes, bronze diabetes, pernicious anemia, myxedema, acromegaly, cachexia, strumipriva, Addison's disease, these all come in this class; (2) by a faulty metabolism whereby normal amounts of waste products are not thrown off. Gout, diabetes, oxaluria, are examples of this type; (3) through retention of the normal physiological products in the organs themselves. Carbon dioxide poisoning is a type; (4) by means of excessive production of physiological or pathological products. Diabetic coma, cystinuria, acetonuria, uremia are types of this form. Such a classification is necessarily very inadequate and will be found to be of service only as a general framework on which a more exact systematization of knowledge may take place. Consult: Herter, 'Chemical Pathology' (1902); Vaughan and Novy, 'Cellulartoxins' (1902). See ANIMAL ALKALOIDS; LEUCOMAIN; PTOMAIN; TOXOLOGY.

Au'to Suggest'ion. See HYPNOTISM.

Au'tocrat of the Breakfast Table, The, a noted work by Oliver Wendell Holmes, consisting of imaginary conversations around a board-ing-house table. The characters are introduced to the reader as the Autocrat, the Schoolmistress, the Old Gentleman Opposite, the Young Man Called John, The Landlady, the Landlady's Daughter, the Poor Relation, and the Divinity Student. It is the most popular of Dr. Holmes' books; and in none of them are his ease of style, his wit, his humor, his kindly sympathy and love of humanity, more clearly shown.

Autol'yus, an amusing thief who figures prominently in Shakespeare's 'Winter's Tale.'

Autom'atism, in animals the power of movement or of action without any stimulus independent of that arising in the protoplasm of cells and tissues. Thus Descartes regarded animals (other than man) as "automata," and declared that they act independently of any volition, or instinctive or intellectual power or faculty; in other words, that their so-called mental acts are involuntary and mechanical—that they

AUTOMATON—AUTOMOBILE

may be compared to machines. In physiology while automatism is apparently the result of the internal conditions of the living body, yet strictly speaking, says Loeb, no animal movements are exclusively determined by internal conditions. The co-ordinated character of automatic movements, he says, has often been explained by a "centre of co-ordination," which is supposed to keep a kind of police watch on the different elements and see that they move in the right order. "But," he adds, "observations on the lower animals show that the co-ordination of automatic movements is caused by the fact that the element which beats most quickly forces the others to beat in its own rhythm." The swarm-spores of algæ, which possess no ganglion cells, show spontaneity equal to that of animals having ganglion-cells, and he concludes that automatism is due to a chemical cause; that is, the pressure or absence of certain ions, or, in other words, to the chemical constitution of the protoplasm. Consult Loeb, 'Physiology of the Brain' (1901).

Automaton, a mechanical contrivance whose actions are arranged to correspond to those of a human being. Friar Bacon had the reputation of having constructed a brazen head which spoke, and Regiomontanus an iron fly, which, after making the tour of the room, returned to its master. Albertus Magnus is said to have spent 30 years in constructing a human figure which advanced to the door when anyone knocked, opened it, and saluted the visitor. In the water-clock presented to Charlemagne by Harun al-Rashid, 12 doors in the dial opened respectively at the hour which they represented; they continued open till noon, when 12 knights issued out on horseback, paraded round the dial, and then returning shut themselves in again. Camus constructed an ingenious toy for Louis XIV, consisting of a carriage drawn by two horses, containing a little figure of a lady with a coachman and attendants. The coachman cracked his whip, the horses moved their legs naturally, and when the carriage arrived opposite the king's seat it stopped; the page stepped down and opened the door; the lady alighted and presented a petition to Louis. The flute-players, the tambour-player, and the wonderful duck of Vaucanson are celebrated for the astonishing ingenuity displayed in their construction. Among the most remarkable automata are the whist-playing and other figures designed by Maskelyne.

Automobile. The word denotes primarily: A vehicle designed mainly for transportation of persons on highways or over unprepared ground, equipped with an internal combustion, hydrocarbon-vapor engine, which furnishes the motive power and forms a structural portion of the vehicle. Secondly, it is used as synonymous with "motor vehicle," denoting a vehicle moved by inanimate power of any description, generated or stored within it, and intended for the transportation of either goods or persons on common highways. As an adjective the word denotes broadly some relation to mechanically-driven vehicles. Even certain railway cars used on short feeder lines in France, Austria, Germany and Italy are known as "automobile railway cars" because they are driven by means of engines of types first used in motor vehicles, and, having passenger or

freight space, also form independent, self-contained transportation units.

The automobile, in the more distinctive primary sense of the word, consists of:

(1) Fuel tank; (2) Carburetter; (3) Engine, with 3a, the Mechanism of the Cooling System, and 3b, the Ignition System; (4) Clutch Mechanism; (5) Power Transmission Mechanism, with 5a, Change-Gear Mechanism, and 5b Differential Gear; (6) Vehicle Frame and Springs; (7) Running Gear; (8) Brake Mechanism; (9) Steering Mechanism; (10) Carriage Work; (11) Lubrication System, and (12) Operating System, including the devices by which the operation of the vehicle is brought under control of hand or foot motions of the driver. These various portions of the automobile form an organic whole, being more or less interdependent, and sharp lines distinguishing one portion from another cannot always be drawn. The classification serves convenience in description, however.

1. **Fuel Tank.**—The source of the power developed by the automobile motor is a liquid hydrocarbon fuel (see HYDROCARBONS), which may be benzene, benzol, gasoline, naphtha, kerosene, crude oil, alcohol (pure or mixed with other hydrocarbons, or water), a solid hydrocarbon, such as naphthalene, that can be liquefied at a low temperature (79° C.), or calcium carbide (see ACETYLENE), throwing off hydrocarbon gas (acetylene) when moistened. In order to be utilized, the liquid fuel must be transformed into vapor, the vapor mixed with oxygen or atmospheric air, and the mixture ignited. Aside from the process of generating an unstable gas by vaporizing the fuel, the principle of the automobile motor is identical with that of the gas engine operated with illuminating gas (see GAS ENGINE).

The fuel tank is usually made of sheet copper and is provided with internal bulkheads to obviate swashing of the liquid. It should have as few seams as practicable, the solder should contain no ingredient soluble in the liquid the tank is intended to contain, and it should be mounted on a rigid foundation to obviate torsion, from which leakage might result. In most gasoline tanks a small air vent in the screw cap by which the charging aperture is closed permits the liquid to be drawn off gradually by gravity through a pipe leading to the carburetter. But the same air vent, if left open, causes loss of fuel by evaporation. By a more modern arrangement a small quantity of exhaust gas is piped into the tank at each exhaust stroke, supplying sufficient pressure to feed the fuel, even if the tank is below the level of the carburetter.

2. **Carburetter.**—Early carburetters were spacious and situated at some distance from the motor, connected by a pipe often 12 to 18 inches long and containing a diaphragm of wire gauze to prevent a flame from accidentally striking back to the vapor and liquid contained in the carburetter. Air was let into the latter from the atmosphere and brought in contact with a considerable area of the liquid (then always benzene, gasoline or naphtha), from which vapor was absorbed either by simple surface evaporation, or by forcing the air through the liquid, or by passing the air at high velocity through a narrow channel containing a wick saturated with the liquid. In all cases the suc-

AUTOMOBILE

tion stroke of the motor piston caused the air current.

The composition of the mixture drawn into the cylinder, to be fired, was regulated by an additional air channel leading direct from the atmosphere to the induction pipe. In warm and dry weather the duct leading through the carburetter was contracted and the direct air admission opening was enlarged, while in cold and damp weather this adjustment was reversed. The object was to obtain an explosive charge of unvarying quantity and composition for a motor intended for constant speed and power development, all necessary changes in vehicle speed being effected through the power-transmission gearing. In raw weather ice (from atmospheric moisture precipitated on the metal cooled by the evaporation of the fuel)

FIG. 1.—SIMPLE MODERN CARBURETTER, WITH AUTOMATIC ADJUSTMENT ACCORDING TO THROTTLE OPENING.

A, Floating plunger. B, Inspection screw to T. C, Cap carrying float feed adjustment. EE', Lock nut to V. F, Gasoline admission pipe. J, Gasoline nozzle. was frequently formed in the carburetter and induction pipe, clogging them. By degrees the method of heating the air, by passing it around the exhaust pipe, was learned, and all pipes were shortened. Still, starting a "cold" motor was an uncertain operation, often requiring preliminary heating of the metal, as it still does (1904) when the heavier oils are used as fuel.

The evolution of the modern carburetter was brought about by the necessity of regulating the force of explosions by a throttling system, to relieve the operator of frequent mechanical gear changes. The steps in this evolution were many and irregular, the most important one consisting in the employment of a nozzle from which the liquid fuel is drawn off in a spray by air suction, to take the place of surface evaporation. Thus the quantity of fuel introduced in each explosive charge is regulated by a mechanical factor which is under control, namely, the air current created by the suction stroke, and not materially affected by temperature and atmospheric conditions. This system requires a modification, however, because an air current will suck liquid gasoline from a nozzle placed in its path in proportion to the square of the velocity of the current (approximately), while the power developed is in simple proportion to the velocity of the piston. An automatic device is therefore required for reducing the air current which draws the spray of fuel, while increasing the current of atmospheric air when the motor speed is being raised, and *vice versa*. The difference in devices serving this purpose constitutes the main difference in carburetters.

3. *Engine*.—In adapting the gas engine to the automobile the first requirement, after devising the carburetter, was the reduction of weight and bulk. The heavy foundation and heavy fly-wheel were undesirable. A small cylinder with a piston working at high speed was preferable to a larger cylinder working with low compression and small piston speed. When weight was cut down and compression of the explosive charge was increased, it was found that the rapid succession of explosions shook the engine and vehicle in a manner destructive to the mechanism and disagreeable to the occupants of the vehicle. By lightening reciprocating parts of the engine, distributing the weight of rotary parts equally with relation to the axis of revolution, by building engines with two, three or four cylinders instead of one, and balancing the explosions in one cylinder against those in an opposed cylinder, but most of all by learning to graduate the volume of the explosive charges according to the requirements for power, excessive shaking and vibration were in course of years considerably reduced.

Equally good results have been obtained with cylinders lying horizontally and standing vertically, the former being more readily "balanced," the latter more easily inspected and repaired. Automobile motor cylinders are made of cast iron, seldom of steel. The pistons are of the trunk pattern, fitting loosely in the cylinders. Circumferential grooves in the pistons contain split steel rings (usually two or three at the upper and one at the lower end) formed

FIG. 2.—COMPLICATED MODERN CARBURETTER, WITH AUTOMATIC ADJUSTMENT ACCORDING TO THROTTLE OPENING AND PISTON SPEED

I, inlet to induction pipe I to cylinder. F, throttle piston (to uncover aperture I more or less) actuated by rod H to governor. D, gasoline spray nozzle communicating through E with gasoline float chamber (not shown). A, air inlet. M, additional air ports more or less uncovered by piston K, held in normal position by spring N and diaphragm P, rigid, and Q, flexible. S, pinhole vent, moderating action of spring N.

and tempered to expand snugly against the cylinder wall. The high temperature produced in the cylinders by the successive explosions of

AUTOMOBILE

charges compressed 75 to 100 pounds per square inch before ignition preclude the use of packed fits.

Throttling of the explosive charge is accomplished by obstructing the induction pipe between the inlet valve and the carburetter nozzle by means of a butterfly valve, or in any other suitable manner. Excessive speed of the motor under light load or when running idle is obviated by a centrifugal governor acting usually upon the throttle valve, but in some instances upon the exhaust valve. In small motors the inlet valve is usually automatic, opened by the suction in the cylinder against the resistance of a helical spring as in a gas engine; in large motors the inlet valve is frequently actuated from the cam shaft, as is the exhaust valve when opening, and with this construction throttling of the motor is sometimes effected by shutting the inlet valve before the suction stroke is completed.

In four-cylinder motors reduction of the

Mufflers—When the burnt gases are exhausted from the cylinder they are still of high temperature and of high tension and their escape into the atmosphere is therefore accompanied by a report-like noise. To subdue this noise a muffler is employed, consisting of an expansion box through which the gases must pass and in which the current of the gas is partially obstructed and subdivided. One of the most efficient mufflers consists simply in a box filled with parallel plates turned edgewise against the current of gas.

3a. *The Ignition System*.—When the mixture of gasoline spray and air (usually heated by contact with the exhaust pipe) reaches the inlet valve of each cylinder, the fuel is partially or wholly vaporized and absorbed in the air current. Entering the cylinder, some recondensation takes place if the cylinder walls and piston are cold (as at the start), but the next piston stroke compresses the charge to a small volume (usually $\frac{1}{4}$ to $\frac{1}{5}$ of the whole cylinder volume),

FIG. 3.—LONGITUDINAL SECTION THROUGH FOUR-CYLINDER MOTOR AND FLYWHEEL CLUTCH.

power development was until 1902 commonly effected, when required, by preventing ignition in one or two of the cylinders, and also by shutting the exhaust valve before the exhaust stroke was completed, thereby setting up internal resistance and also reducing the volume of the next explosive charge, while changing its composition by mixing it with the remaining exhaust gases. These methods are now (1904) almost abandoned. The earliest means of reducing the effective power of the motor consisted in retarding the ignition, so that the combustion would not be finished when the exhaust valve was opened. This method is still generally used, but only as an auxiliary to the throttling of the explosive charge.

and thereby heats its and prepares it for ignition. The means employed for igniting the charge consisted at first altogether, and still occasionally, in a kerosene lamp (later pattern: an alcohol vapor lamp) over the flame of which (later: in the flame) a platinum tube was screwed into the upper end, or combustion chamber, of the cylinder. The outer end of the tube was closed and brought to red heat or incandescence by the flame.

By the compression stroke a small portion of the charge was forced into the tube and fired back into the cylinder when it reached the hot portion of the tube. The ignition took place at the highest compression or slightly earlier or later, varying according to the piston speed,

AUTOMOBILE

but the variation was insufficient to give the highest power at the highest piston speed and yet not too early for low speed, because the whole charge should be aflame and expanding with maximum force shortly after the power stroke has begun and, when the piston moves with high velocity, this cannot be accomplished unless the ignition begins long before the compression is at its maximum, the time required for spreading the flame being almost constant for a vapor mixture of given composition.

The method was also unadapted for a motor in which the new throttling system introduced

FIG. 4.—JUMP SPARK PLUG.

variations in compression, and the open flame of the lamp was a source of danger in case of gasoline leaks or road accidents. So, when the throttled fuel admission came in vogue, "hot tube" ignition, despite its reliability, was gradually abandoned in favor of the electric spark, produced internally in the cylinder head by (1) a dry battery; (2) an induction coil (see INDUCTION), causing a high-tension current; (3) an interrupter or "trembler," and (4) a switch turning the current off and on at the proper time, operated from the same camshaft from which the exhaust valve is opened. A "spark plug" contains the two terminal wires, insulated by porcelain, lava or pressed mica within a hollow metal screw plug, and is screwed into the cylinder head. The terminals are about 1-16 inch part, and this is the length of the "jump

FIG. 5.—DIAGRAM OF MAGNETO SYSTEM FOR IGNITING EXPLOSIVE VAPOR MIXTURE BY PRIMARY CURRENT JUMP SPARK.

A, permanent field magnets; B, armature of H-section; C, armature coil wound in two sections, D and E, connected in series; F, wire to one terminal of circuit breaker G, worked by cam H; I, grounding wire from other terminal of G to metal of armature and thence on to metal work of motor and vehicle; J, condenser in parallel with G; K, spark plug, wired from E's outer terminal.

spark." The metal mass of the vehicle frame serves to "ground" the current. The wiring throughout is insulated. Instead of a jump spark a "hammer spark" or a "wipe spark" may be used.

The main drawback to this arrangement arises from the fact that the life and potentiality

of dry batteries vary greatly, so that they often fail unexpectedly. Storage batteries are used in their place in many European automobiles, but these, too, eventually give out and must be recharged. A dynamo, however, driven by the vapor engine, furnishes a current for ignition so long as the mechanism remains in order, rendering the ignition an automatic function. While the other methods remain in extensive use, the dynamo driven by belt or gear from the motor shaft, is fitted to most high-powered automobiles, especially in the form known as the magneto.

3b *The Cooling System.*—Part of the heat generated by the explosions is transformed into the work of driving the piston, but a large portion is absorbed as heat in the piston, cylinder walls, valves, etc. These, unless artificially cooled, become so hot as to ignite the lubricating oil, and also the next explosive charge before the piston is in position to receive a new impulse. Such premature ignition drives the piston back in the direction opposite that desired and stops the motor. The burning of lubricating oil also leaves a deposit on walls and valves which soon interferes with piston travel, valve action and spark ignition. The means adopted to keep the motor sufficiently cool are in brief as follows:

Small cylinders (up to 2 horse-power) may be ribbed externally, thereby increasing the

FIG. 6.—HORIZONTAL, TWO-CYLINDER, AIR-COOLED AUTOMOBILE ENGINE.

metal surface, from which heat is lost by radiation and contact with the atmosphere. Rapid motion, constantly bringing fresh cool air to the heated metal, is essential to render this system efficacious. When the motor works at full charges while the vehicle is at rest or moving slowly, renewal of the air must be effected by a blow fan or equivalent means. A few automobiles are operated with air-cooled motors; some of them are now equipped with a fan, but until recently the motors were usually shut down when the cars were at rest, and the vehicles are not adapted for heavy, slow work. The smaller each cylinder, the more acceptable the air-cooling method, because a small cylinder has more radiation surface in proportion to the volume of vapor burned than a large cylinder.

Ordinarily the automobile cylinder is kept at the proper temperature by means of a "water jacket" surrounding cylinder and valve chamber, a water circulating pump (driven from the motor shaft) and a "radiator" consisting of a nest of coiled tubes. The latter are strung with metal fins, soldered on, to increase the radiation area. A water tank is connected with this system. The order of circulation is from water jacket through pump to radiator, thence to the tank and back to the water jacket. The pump

AUTOMOBILES.

GASOLINE TOURING CARS.

AUTOMOBILE

is usually of the centrifugal class, sometimes "rotary" (see PUMPS), and in a few automobiles is omitted, circulation in that case depending solely upon the difference in temperature between the water in the jacket and that in the radiator, the latter being unusually large.

By increasing the dimensions of the pump, to produce more rapid circulation, and reducing the diameter of radiating tubes while increasing their total radiation surface, the amount of water to be carried and the capacity of the tank, have been gradually diminished. With the so-called "honeycomb" coolers the water tank is almost dispensed with, consisting of only two small compartments framing a network of flattened tubes erected in front of the motor, through which air is drawn rapidly by means of an exhaust fan, usually forming the spokes of the engine fly-wheel. The air current in this case is defined within a closed motor hood. In other cases the hood is provided with slits. In the winter when water might freeze and burst water jacket, cylinder or radiator, calcium

FIG. 7.—LONGITUDINAL SECTION OF VERTICAL CYLINDER WITH CORRUGATED SHEET COPPER WATER JACKET.

Showing also Trunk Piston with piston rings, combustion and valve chamber with spark plug, inlet and exhaust valves with springs and exhaust pipe.

chloride or glycerine is admixed to lower the freezing point, or a special oil distilled from crude petroleum is used instead of water.

The water jackets were up to 1903 commonly cast integrally with the cylinders, cylinder heads and valve chambers, but the difficult cored castings were often faulty, especially when only cylinder heads and valve chambers were jacketed. More recently sheet copper has been secured to flanges on the cylinders, etc., so as to form a jacket between the copper and the plain cylinder casting, and weight reduc-

tion as well as some elasticity (affording security against accidental freezing of the water) have been gained thereby, while the quality of castings has been improved.

4. *Clutch Mechanism.*—A vapor engine, like the gas engine, must be started by hand power, or auxiliary power of some kind, as no power is stored in it while at rest. It cannot be started, therefore, under load without an inconvenient effort, and every automobile vapor engine (excluding those used on motor bicycles and motor boats) is arranged to be started running idle to be subsequently connected with its load by a clutch. Often there is a separate clutch for each rate of gear reduction. In earlier automobiles this was the rule, while now (1904) it is the exception. All the various forms of clutches used in other branches of mechanical engineering have been tried on automobiles, all being more or less perfectly adapted to the requirements: That they shall grip a motor shaft revolving at high velocity without sudden seizure; that they shall be automatically self-adjusting to wear within a considerable range and further adjustable by a screw or other convenient means; that the clutch surface shall be large enough and smooth enough to obviate injurious heating when slipping, and that the release shall be positive, without requiring much physical effort.

The clutch most commonly used in those automobiles having the motor shaft disposed longitudinally of the vehicle, consists of a male truncated cone (angle 10 to 12 degrees), engaging a corresponding female cone formed in or attached to the rim of the motor flywheel. The male cone is leather faced, and is secured, slidingly, to the transmission gear shaft, a strong helical spring pressing it forward (or, in later construction, drawing it back) into the female cone. To secure concentricity of the two cones the transmission gear shaft is usually journaled in the end of the motor shaft (carrying the flywheel) by a ball bearing, and end thrust at this point is obviated in modern design. The engagement of the clutch is effected by a clutch lever which releases the spring, permitting the cones to come together. The same action usually releases one set of brakes, which is intended to be used only when the motor is disengaged from the driving gear. After disengaging the clutch it requires a further movement of this lever to set these brakes.

5. *Power Transmission Mechanism.*—In starting a heavy car from a standstill by clutching a rapidly revolving motor shaft, there would be danger of breaking the connections between the clutch and the rear wheels (which are the driving wheels in nearly all automobiles, so far), or of stopping the motor by the resistance, unless the latter were reduced by gearing permitting the vehicle to move slowly while the motor shaft revolves at high velocity. As motor power is proportional to motor speed, under a given load, the necessity for at least one gear reduction between motor shaft and driving wheels remains, even with modern motors capable of being throttled to low speed, the power of the higher speed being frequently required for overcoming the inertia of the vehicle—on hills, for example.

As a matter of fact, most heavy automobiles have three geared driving connections and one

AUTOMOBILE

direct connection for going ahead, and one geared connection for driving backward, while lighter vehicles have one gear reduction for going ahead and one for reverse, besides the direct drive ahead. In all cases the motor speed alone determines the power available at the moment, and the motor speed in conjunction with the driving gear employed determines the vehicle speed. The art of driving an automobile consists largely in using the smallest gear reduction (the "highest gear") and the smallest motor speed that, combined, will produce the desired vehicle speed. Before motors could be throttled to give a wide range of power development, the art of driving consisted largely in the manipulation of the levers by which the gear reduction was changed. The development has been from gear control of the vehicle to throttle control of the motor; under both methods the brakes are freely used as an auxiliary, especially in congested traffic.

Hundreds of transmission systems have been, and are, in use, and are described in textbooks on the subject. The mechanical elements of which they are composed are mainly those well known in machine tool practice: the belt,

principle is the "expansion pulley" belt transmission system, which also takes the place of all change-gear mechanism. Only one belt is used, which has broad chamfered edges and transverse reinforcing strips sufficiently rigid to permit the belt to ride mainly on the edges over V-pulleys of changeable diameter. When the driving pulley is expanded the driven pulley is correspondingly contracted. The gear ratio may in this manner be altered by insensible graduations. See PULLEY.

Fig. 9 shows one pattern of power transmission in a vehicle with a transverse motor shaft. Fig. 10 shows the system of bevel-gear transmission, through change-gear mechanism, to a differential gear on a countershaft and sprocket-and-chain transmission from the ends of the latter to the rear wheels, the rear axle being fixed. Fig. 11 shows the system of bevel-gear transmission, through change-gear, to a differential gear on a divided rear axle which revolves and turns the wheels keyed to it. In modern construction of this type the rear driving axle is relieved of the support of all weight, being contained within a tubular supporting axle, brazed or bolted to the differential

AND UNIVERSAL JOINT (to the left) TO
BEVEL-GEAR SHAFT.

spur wheel, bevel gear and shaft, the countershaft, sprocket wheel and chain. From 1886 to 1902 belts were employed to transmit power from a transverse motor shaft to a parallel countershaft in automobiles evolved from the model first designed and built by Karl Benz, of Mannheim, Germany, in 1886. By a series of stepped pulleys, any pair of which could be clutched and keyed to the shafts, respectively, this belt system served also as engagement clutch and change-gear device. In commercial competition with toothed-gear transmission, patterned after the vehicle designed by Gottlieb Daimler, of Cannstatt, Germany, also in 1886, the belt system gradually lost favor, probably more by reason of the energy and ingenuity applied to the general improvement of vehicles equipped with tooth-gear transmission and change-gear devices, than owing to any intrinsic superiority of the gear drive. For the present (1904) belt transmission is practically abandoned. A surviving adaptation of the

gear casing, on the ends of which the wheels are mounted by ball or rolling bearings, while the driving-axle-ends are keyed to the external faces of the wheel hubs.

5a. *Change-Gear Mechanism.*—The primitive change-gear included a clutch or key for each gear ratio. With numerous variations, the general principle is as follows: To the transverse motor shaft, prolonged beyond the fly-wheel, are rigidly secured spur wheels of varying diameter. On a parallel countershaft are mounted other spur-wheels meshing pairwise with those on the motor shaft, but free to rotate around their own shaft, instead of with it, unless clutched. To a small spur wheel on the motor shaft corresponds a large one on the countershaft, and this combination produces, of course, the low countershaft speed which can be still further reduced by transmitting the motion from a small sprocket wheel at the end of the countershaft to a larger one on the rear wheel of the vehicle.

AUTOMOBILE

Suppose the speed is divided by five from motor to countershaft and further divided by three by the sprocket chain ratio, the total reduction is then from 15 to 1; the wheel revolves once for fifteen revolutions of the motor shaft. The vehicle speed will further depend upon the diameter of the rear wheels. If this is about 34 inches, making the circumference about 9 feet, and the motor shaft revolves 900 times per minute or 15 times per second, the rear wheels, revolving once per second, will advance the vehicle 9 feet per second or 540 feet per minute. In ten minutes the car will have traveled 5,400 feet, or somewhat more than a mile, corresponding to between 6 and 7 miles per hour. By throttling the vapor admission the motor speed may be reduced to 200 revolutions per minute, reducing the vehicle

time. Modern developments of this system are much simplified, mainly by the employment of epicyclic gears (see EPICYCLIC GEAR).

The change-gear system which was developed when the engine was placed in the front portion of the vehicle with the motor shaft in the plane of the lengthwise axis, was designed to reduce noise, wear and waste of power, by having only one pair of spur wheels in mesh at one time. It is known as the clash-gear or sliding-gear system (see Fig 8). The shaft carrying the cone clutch has a universal joint coupling it to a shaft in prolongation of it, the latter carrying spur wheels of different diameter rigidly secured. It is journaled in an oil-tight casing hung in the vehicle frame. Lower in the same casing is journaled a parallel squared shaft carrying a slidable sleeve with rigidly secured

speed to $1\frac{2}{3}$ miles per hour. In early automobiles, where throttling was not so effective, the brake served to reduce the motor speed by increasing the resistance.

While one pair of spur wheels drives, the several other pairs are, with this system, in mesh, but revolve idly. This accounted largely for the metallic noise of the earlier models. One of the pairs of spur wheels was not strictly in mesh but a small intermediate pinion on a rock shaft transmitted the motion to the spur wheel on the countershaft, thereby reversing its direction and causing the vehicle to be driven backwards when the clutch was applied to this purpose. Clutch levers and change-gear levers were identical, and were so interlocked that only one clutch could be set at one

spur wheels so disposed that, in one position of the sleeve, none of these spur wheels is in mesh with any of those in the fixed, upper shaft. But when a fulcrumed fork, acting against a flange of the sleeve causes the latter to slide a short distance, one pair of gears, say, the lowest gear, are engaged. A further motion in the same or the opposite direction, releases the low gear and engages the second gear. A still further motion releases the second and engages the third; and in the same manner the fourth and the reverse are engaged and released. A small pinion on a special rock shaft produces the reverse, as in the older system. The edges of the spur teeth are rounded to facilitate meshing, and the cone clutch is automatically released while a change of gear is made; yet it

AUTOMOBILE

requires rapid and resolute manipulation of the change-gear lever (or levers) to avoid burring of the spur wheels.

Ingenious arrangements are made in many cars to have consecutive motions of the gear lever produce a consecutive transition from the lower to the higher gear, and *vice versa*. In some cases the upper shaft is divided into two portions, the rear one of which, in its foremost position, grasps the front portion by a hollow square while all spur wheels are disengaged, thereby transmitting power direct from the motor shaft to the differential gear without speed reduction. The advantage is always bought at the cost of more gear complications for the lower speeds.

5b. *Differential Gear*.—This apportions motion between the two rear wheels, permitting one to revolve faster than the other, as at turns, where the outer wheel describes a longer curve than the inner one. The differential gear used in automobiles was at first the same as used in other mechanical constructions (see DIFFER-

machine portions of an automobile has been realized only by degrees. The small motors of early vehicles were mounted either in the wagon box at the rear of the seat (only one seat), with two radius rods running from the motor shaft to the rear axle (so as to keep the sprocket chain at even tension, or on a rigid frame of angle iron or steel tubes extending from the rear to the front axle. The latter method survived in a few instances up to 1900 and is now (1904) observed only in some heavy vehicles intended for slow hauling of goods, in which the absence of spring suspension for the motor mechanism is not so injurious as in fast-moving cars. Metal reaches between the two axles, serving merely to brace the construction, survived longer, but finally disappeared with the general adoption of a rigid steel frame supported by four semi-elliptical springs and carrying the entire mechanism as well as the vehicle body. Some notable American exceptions to this rule have inverted elliptical springs transversely in front instead of the two semi-elliptical springs,

ENTIAL GEAR), consisting of two bevel-gear plates, of equal diameters, mounted on the contiguous end portions of the divided shaft, designed to be revolved, and four bevel-gear pinions journaled radially between the two gear plates and meshing with them. Motion transmitted to the ring holding the outer ends of the pinion shafts, cause both bevel-gear plates to revolve equally, unless one resists more than the other, in which case the small pinions revolve and permit the plate which moves easier to move farther. In the United States a form of differential gear was developed in connection with automobiles, in which straight spur wheels and pinions took the place of bevel-gears.

6. *Vehicle Frame and Springs*.—The need of a special metal frame for supporting the

giving the front axle more freedom to oscillate, as required when traveling over rough ground. Many popular small American automobiles form another exception, having the entire frame secured by clips to the inactive middle portions of two side leaf-springs, whose bent-down rear and front portions are secured to the rear and front axles, respectively (see Fig. 9)

At first most frames were made of wood or drawn steel tubes brazed together (an adaptation from bicycle construction). Subsequently greater rigidity was attained by armoring the wood with steel flitch plates, or by the use of structural iron or steel in various shapes, bolted and riveted together. This was convenient for experimental work, changes being easily effected. When the types of vehicles became more defi-

AUTOMOBILE

nitely accepted, frames pressed in one piece from large blanks of sheet steel made their appearance. In a few cases pans of sheet steel joined the side reaches forming a protection underneath against mud and dust.

The springs used in automobiles are generally common carriage leaf springs calculated for such weights as they are intended to support. In course of time their length and weight have been gradually increased, with a view to combining strength with great flexibility. In case of side springs extending from axle to axle, as referred to above, this tendency influenced and modified the general design of the vehicles.

7. *Running Gear.*—In this division may be included axles, wheels and tires. Nearly all early automobiles (1890 to 1898) were equipped with wire-spoke wheels, the spokes laced tangentially to the hub on the suspension principle borrowed from bicycle construction. These wheels have given way to stout wood wheels, seldom more than 34 inches in diameter, built around a metal hub and enclosed in an iron ring to which a solid or inflated rubber tire is attached. The pneumatic or air-inflated rubber-covered canvas tire is used almost exclusively for pleas-

selves readily to traction from one motive centre, but front wheels are sometimes arranged to revolve in a slightly inclined (2°) plane, with a view to facilitating the steering operation by bringing the ground contact of the wheel directly under the pivot pin, a design of special value on rough ground where slanting impacts at the wheel rim would otherwise tend to turn the wheel or strain the steering gear.

The front axle of automobiles is stationary and frequently bowed down at the middle to permit a low position of the motor. To each end, just beyond the spring clips, is brazed a "knuckle" or fork, in which is journaled a pivot pin carrying at right angles, or slightly inclined, the rock shaft around which the front wheel revolves, usually on ball or roller bearings. The pivot pin is mounted in end-thrust ball bearings. Each pivot pin carries, besides the wheel shaft, a lever arm, projecting either forward and slightly outward, or rearward and slightly forward. The arms are connected by a rod, synchronizing the turning of the two wheels. The steering gear acts upon this rod or upon an additional arm on one of the pivot pins. The "fifth wheel" device has never been generally

FIG. 11.—SIDE ELEVATION OF AUTOMOBILE CHASSIS.

With bevel-gear driving shaft from change-gear to differential gear on special rear driving axle separate from the rear supporting axle of the vehicle.

ure automobiles, and its maintenance involves from 25 per cent to 50 per cent of the cost of operating a vehicle. On the other hand, air-tires afford a cushioning action, supplementary to that of the carriage springs, which protects machinery and wheels, especially against lateral shocks, in a manner for which no substitute has been found for vehicles intended for a speed above 15 or 20 miles per hour. At such and higher speeds the tire resiliency is characterized by the avoidance of vertical recoil.

Automobile wheels are also made of steel tubing, locked and brazed in a steel hub; elastic wheels with S-shaped spokes of tempered metal leaves have been tried, as well as composite wheels involving a cushioning medium between the felloe and the hub. So far (1904) the wheels have not been dished (to gain strength), as inclined or "set" axle ends do not lend them-

used in automobiles, being practical only when steadied with the leverage of a long pole, as in horse-drawn vehicles.

The bearings in automobile wheels were first plain "parallel bearings," then mostly ball bearings. Then followed a reaction favoring plain bearings. Lately ball bearings (in Europe) and roller bearings (in America) are usually fitted and, if well made and calculated for their loads, give satisfaction and reduce traction resistance, besides being more durable than parallel or coned shaft bearings.

Rear axles are either stationary (solid, tubular or H-shaped), carrying wheels revolved by sprocket wheels and chains, or rotary and divided near the middle by the differential gear, the wheels keyed to the axle ends and the bearings clipped to the vehicle springs. It was early found, however, that an axle supporting the

AUTOMOBILING

greater portion of the vehicle's weight should not be subjected to the alternating stresses resulting from rotation, unless it was made much stronger, theoretically, than a fixed axle. Gradually the divided and revolving axle was therefore modified until a design was developed separating motive power from support, as explained under Power Transmission.

(8) Brake and (9) Steering mechanism, and also (10) Carriage work are essentially constructed on the same principles in vapor engine automobiles as in motor vehicles in general and are referred to under MOTOR VEHICLES.

11. *Lubricating System*—The lubrication of vapor engines presents certain difficulties caused by the very high temperature of pistons and cylinder walls, and the liability of fouling valves and spark points if an excess of lubricant is used. A thin oil of high flash and ignition test is the chief requirement. The mercantile method of placing different oils on the market under the same name, and the same oil under different names (allowing agents to name it), has obscured lubricating problems and retarded uniformity in practice. With vertical cylinders it is customary to place a quantity of oil in the crank casing and depend upon lubricating the cylinder and con-

FIG. 12.—ELEVATION OF AUTOMOBILE FRONT AXLE WITH KNUCKLES, STEERING PIVOT PINS, AND INCLINED WHEEL SHAFTS.

A, Front Axle; BB, Knuckles, CC, Pivot pins; D, Rod connecting arms on pivot pins, E, connection from arms to steering gear (not shown).

necting rod by the oil splashed from the casing by the rotation of the crank. For horizontal cylinders sight feed drip lubricators regulated by hand have been extensively used, as they still are for steering gear, transmission gear and wheel bearings, but the most approved practice demands a force feed system operated from the cam shaft of the engine, so as to proportion the feed to the engine speed.

It is common practice to stuff the change-gear box with grease (vaseline and graphite is a popular mixture) and to use cylinder oil for all other bearings. Mechanical oilers distributing the oil from a central reservoir, often placed on the dashboard, through a system of canalization and by pressure derived from the engine exhaust gas, are generally employed.

12. *Operating System*.—The devices by which the operator of an automobile controls the motor, clutch or clutches, the change-gear, brakes, steering wheel and the lubrication system have undergone many changes and remain much diversified. The starting device is nearly always a detachable crank fitting the squared end of the motor shaft, either in front of the vehicle or at the side. The motor, when started, automatically releases the crank, the turning of

the shaft pushing the crank out of engagement by a screw action supported by a spring. In many automobiles a small lug prevents the insertion of the crank if the ignition device happens to be adjusted to give an early spark which would start the piston in the wrong direction, and whereby the crank might be thrown violently back, injuring the starter.

The spark-timing handle and the throttle handle are generally placed close to the steering wheel (or steering lever), while one band brake (usually acting on the circumferential ring of the differential gear), and the cone clutch are actuated by one or more pedals. The change-gear lever (sometimes two) and the brake lever (actuating band brakes contracting around, or expanding into, drums in the rear wheels) usually extend through slots in the footboards, or at the side of the vehicle within convenient reach of the operator's right hand. In a few cases the operating devices are at the left side, the operator's seat being there. Automobiles vary more, perhaps, in the arrangement of operating devices than in any other feature of construction, and a brief general description covering established practice is therefore impossible.

In the broadest definition of "automobile," which is sanctioned by common usage, the word may be applied to any mechanically propelled vehicle, whether the source of power is a vapor engine, or steam engine, an electric accumulator or storage battery, stored compressed air or any other form of primary or secondary generator, but historically the word was not coined or applied until (about 1888, it seems) the appearance in France of benzine vapor engine vehicles, while steam cars for common highways antedate locomotives, having been made, especially in England, before the railways were thought of. The development of electric vehicles also began independently of the vapor engine vehicle. If a distinction should be made between automobiles and motor vehicles—and the distinction would be a convenience in nomenclature—the latter term should be the broader one, including all forms of power, while "automobile" should be reserved for motor vehicles equipped with a vapor-explosion engine and driven by purely mechanical transmission of power from the engine shaft.

In accordance herewith, information in regard to steam and electric vehicles for common roads, as well as vehicles propelled through electric motors deriving their current from either a steam or a vapor engine, will be found under MOTOR VEHICLES.

MARIUS C. KRARUP,

Formerly Editor of 'The Automobile.'

Au'tomo'biling, recreative contests and not commercial value may be fairly credited with having given the automobile its first start in America, for by them it caught public attention. The sight of the horseless machines, with no visible means of propulsion, no rails, no overhead wire, no underground current; out of nothing apparently attaining a speed in the straight on the old Guttenberg Race Track, New Jersey, at the Three Counties Fair in 1893 of over 50 miles an hour, was enough to set tongues wagging, and newspaper reporters agape; and to call upon even the instantaneous photographer for his best efforts. This and similar exhibitions soon led to other and longer

AUTONOMY — AUTREFOIS CONVICT

contests on tracks, to 10-mile tests, to 20, and upward; and from thence to greater and greater distances on the public highways. These competitions eventually divided themselves into two classes; one set to settle the question as to which kind of power could cover the most miles in the shortest time; the other to test which of many could cover the same route under the same conditions, with the least number of mishaps, or stoppage, for any purpose whatever connected with the machine; that is, for repairs, for renewal of power, or from difficulties insurmountable by the particular model and motive power used. Naturally competitions on artificially made tracks with smooth surfaces have produced the most astonishing speed results. Henri Fournier in a gasoline automobile on the Ocean Parkway, Brooklyn, made a straightaway mile in 51½ seconds on 16 Nov. 1901; Foxhall Keene covered the same course in 54½ seconds, and A. C. Bostwick in 56½ seconds. At greater distances equally surprising results have been obtained: Alexander Winton, at Providence, R. I., 24 Sept. 1902, covered 5 miles in 5 minutes 29½ seconds, and at Cleveland, 16 Sept. 1902, 10 miles in 10 minutes and 50 seconds. Fournier covered 20 miles at Fort Erie, 26 Sept. 1901, in 25 minutes and 25½ seconds; and Winton in Chicago, in September 1900, 50 miles in 1 hour 17 minutes and 50 seconds. In road racing, taking the roads as they came, the distance from New Haven to New York, 82 miles, has been covered in 3 hours 10 minutes, and New York to Boston, 225 miles, in 15 hours 11 minutes. The most interesting and trustworthy contest for endurance was that arranged in October 1902 by the Automobile Club of America from New York to Boston and return, in which the speed was limited to 14 miles an hour to conform to the local laws. There were 75 starters, of which 68 completed the round trip. Seventeen received certificates of a perfect record, and 51 received certificates of a speed over 12 and less than 14 miles an hour all through the trip.

Autonomy, the self-government of a state. This power may reside within limited bodies of the same people, such as parishes, corporations, religious sects. These districts or communities may be autonomous, if not absolutely, yet within certain defined limits. They may be said to enjoy a partial, limited, or local autonomy. Autonomy is often used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. Recently the word is more specifically used of territories or provinces, which, while subject in some matter to a higher sovereignty, are autonomous in other respects. Thus the Treaty of Berlin made eastern Rumelia an autonomous province; though subject to the direct political and military authority of the Sultan, it was to have administrative autonomy in all its internal affairs. Egypt possesses a higher autonomy. The self-government enjoyed by the British colonies may be described as a modified form of autonomy.

Autoplasty, a term denoting a method of surgical treatment which consists in replacing a diseased part by means of healthy tissue from another part of the same body. The most

familiar instance is the rhinoplastic or taliacottian operation, for supplying a new nose from the skin of the forehead. It is more popularly known as skin-grafting.

Autoplate, a machine for making and finishing curved stereotype printing plates for use in printing newspapers, invented by H. A. Wise Wood of New York, and first put into use upon the New York *Herald*. This machine, after a flexible papier-maché matrix, made from a type page, is inserted therein, proceeds to cast printing plates, weighing about 50 pounds each, at the rate of four a minute, and to dress their edges and inner surfaces and prepare them for attachment to the printing cylinders, and this is done automatically—all within the compass of one machine. Previous to the advent of the autoplate such work had been invariably done by hand-worked devices, with which the fastest rate of production attainable was at the rate of slightly less than one plate per minute. So great a change did this invention make in the work of stereotyping upon the larger newspapers, that not only was the machine generally adopted, but in every case the hand apparatus were entirely dispensed with, and sole dependence placed upon the autoplate.

Au'topsy, eye-witnessing, a direct observation. The term is generally applied to a post-mortem examination, or the dissection of a dead body.

Au'totype, a method of phototyping. Tissue prepared with a liquid composed of gelatine, sugar, and bichromate of potash, is used for taking a collodion negative in the ordinary way, and is next applied under water with the face down to a plate of glass, metal, or other paper, coated with gelatine and chrome alum. Means are then taken to remove the parts not hardened by light, and, finally, by another elaborate process, the plate is made ready for the printing-press.

Autran, ô-trân', Joseph, French poet: b. Marseilles, June 1813; d. there, 6 March 1877. His verse is admired for its purity of form and refined sentiment. He attracted attention in 1832 with an ode to Lamartine, 'The Departure for the East.' His works include 'The Sea,' poems (1835); 'Milanah,' an epic (1842); 'Rural Life' (1856); and 'The Daughter of Æschylus,' drama (1848), which won a prize from the French Academy.

Autrefois Convict, ô'tr-fwa' kôn-ve', in criminal pleading, a plea made by a defendant indicted for a crime or misdemeanor, that he has formerly been tried and convicted of the same. This plea is similar in form as the plea of *autrefois acquit*, and is based upon the same general principle, to wit: that no man's life or liberty shall be twice put in jeopardy for the same offense. A plea of *autrefois convict*, which shows that the judgment on the former indictment has been reversed for error in the judgment, is not a good bar to another indictment for the same offense. But a prior conviction before a justice of the peace, and a performance of the sentence pursuant to the judgment, constitute a bar to an indictment for the same offense, although the complaint on which the judgment proceeded was so defective

AUTUMN—AVA

that his judgment might have been reversed for error. The New York Code of Criminal Procedure, § 9, expressly prohibits a second prosecution for the same crime. At common law it is necessary, according to the weight of authority in a majority of the United States, to specially plead former conviction or acquittal. In many of the States, however, by statute, the plea of *autrefois acquit* may be taken advantage of under the plea of not guilty. The statute adopted in New York is similar in its terms to that of many other States. It is provided by the New York Code of Criminal Procedure, § 322, that a plea of former judgment of conviction or acquittal of the crime charged may be pleaded with or without the plea of not guilty.

Autumn, the season of the year which follows summer and precedes winter. Astronomically, it is considered to extend from the autumnal equinox, 23 September, in which the sun enters Libra, to the winter solstice, 22 December, in which he enters Capricorn. In popular speech it includes the months of September, October, and November.

Autun, ô-tên, France (ancient *Bibracte*), a town in the department of Saône et Loire, of considerable interest both from its antiquities and from its modern edifices. Of the former the more remarkable are two Roman gates of exquisite workmanship and in good preservation, the ruins of an amphitheatre and of several temples; of the latter the most conspicuous is the cathedral of St. Lazare, a Gothic structure of the 11th century. Pop. (1896) 11,873.

Autunite, a beautiful canary-yellow mineral, occurring in thin, tabular crystals of orthorhombic symmetry, but closely approaching the tetragonal mineral torbernite in form. Both of these minerals are hydrous phosphates of uranium, but while calcium is an essential constituent of autunite, whose formula is $\text{Ca}(\text{UO}_2)_2\text{P}_2\text{O}_8 + 8\text{H}_2\text{O}$, it is replaced by copper in torbernite, which is further distinguished by its green color. Autunite has eminent basal cleavage, resulting in a pearly lustre on the basal plane, while on the edges of the crystal the lustre approaches adamantine. It has a hardness of 2 to 2.5 and a specific gravity of about 3.12. Some autunite is beautifully fluorescent. Its name is derived from its most noted locality, Autun, France, where it is found in closely aggregated masses of crystals. Other noteworthy occurrences are in Cornwall, England, in Saxony, North Carolina and South Dakota.

Auvergne, ôvâr'n'y, a province of central France, now included in the departments Cantal, Puy-de-Dôme, and Haute Loire. The mountains of Auvergne are the highest in the interior of France, the highest of them, Puy-de-Dôme, being 4,805 feet above the sea. It is entirely composed of volcanic matter, and has a regular crater 1,000 feet in circumference, and 300 feet deep. The whole of the cones present the same general character—well-defined craters enclosed by regular cones, on whose sides the lava currents may be traced as easily as on those of Vesuvius.

Auvergne, Mountains of, a branch of the Cevennes, chiefly situated in the depart-

ments of Puy-de-Dôme and Cantal (France). The most important peaks are Puy-de-Sancy (6,185 feet), Plomb du Cantal, and Puy-de-Dôme.

Auwers, Arthur, German astronomer: b. Gottingen 12 Sept. 1838. He became assistant in the observatory at Königsberg in 1859, and at Gotha in 1862; in 1866 was made a member of the Berlin Academy and astronomer to it. In his capacity of president of the Astronomical Society he was conspicuously identified with the preparation of the great co-operative catalogue of over 100,000 stars. For his services to astronomy he was made a foreign member of the Academy of Sciences at Washington, from which he also received the Watson gold medal. Among his works are 'Neue Reduktion der Bradleyschen Beobachtungen 1750-62' (1882-8), and 'Katalog von 9,789 Sternen' (1896).

Aux Cayes, ô-kā', a seaport town of Haiti, situated on the southwest coast of the island, about 85 miles west of Jacmel. It has an excellent harbor, a good export trade, and is the seat of an American consular agent. Pop. about 25,000.

Auxerre, ô-sār' (ancient *Antissiodurum*), a town in France, 96 miles southeast of Paris. It is finely situated on a height above the Yonne, which here becomes navigable, but is very poorly built. Its principal edifices are its cathedral of St. Stephen, a splendid Gothic structure, with a finely proportioned interior, and windows containing most beautiful stained glass; the church of St. Germain, with some curious crypts; and a magnificent old episcopal palace, now converted into the Hôtel de Prefecture. The manufactures consist of woollens, hats, wine casks, leather, red and yellow ochre, earthenware, and violin strings; and the trade is chiefly in wood and in the wines of the district. Of these wines the most famous is the white Chablis. Pop. (1896) 15,082.

Auxonne, ô-sün' (Latin *Asona* or *Aussona*), a town in France, 18 miles east-southeast of Dijon, on the left bank of the Saône, here crossed by a beautiful bridge of 23 arches. Auxonne is well built, the seat of a court of commerce, and has a communal college, and a public library containing 4,000 volumes; a castle, an arsenal, and a cannon foundry. Pop. (1896) 6,700.

Auzout, ô-zoo', **Adrian**, French mathematician: d. 1691, inventor of the micrometer, still in use among astronomers to measure the apparent diameter of celestial bodies. He was the first who thought of applying the telescope to the astronomical quadrant.

Ava, ā'va, or **Aungwa**, a town in Asia, the former capital of Ava or Birmah, on the Irrawaddy. It has a circuit of about five miles, and consists of an inner and an outer town, each surrounded by a brick wall. Pop. (1891) 39,477.

Ā'va, Arva, Yava, or Kava (*Piper methysticum*), a plant of the natural order *Piperaceae*, possessing narcotic properties. It is a shrubby plant, with heart-shaped acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South Sea Islands, where

AVADHUTA—AVALON

the inhabitants intoxicate themselves with a fermented liquor prepared from the upper portion of the root and the base of the stem. The rhizome is thick, woody, rugged, and aromatic. The intoxicating liquor is prepared by macerating it in water. The narcotic property is ascribed to an acrid resin, *hawine*, present in the root. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of *ava* causes a whitish scurf on the skin, which, among the heathen Tahitians, was reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it. *Ava* is, like cocaine, a local anæsthetic.

Avadhuta, a'va-d'-hoo'ta, a member of a mendicant sect in southern India addicted to self-torture.

Av'anche, a mass of snow or ice which slides down steep mountain slopes. On lofty mountains snow would accumulate indefinitely if the excess were not removed by sudden falls or by glaciers which bring it into the valleys, where it melts. Avalanches may occur at any season of the year, but they are most frequent in early spring after the snow has begun to melt from the sun's rays. The water which collects beneath the snow bank loosens it from the ground, and the whole mass may then be precipitated to the base of the mountain. Such avalanches occur regularly in the Alps, where they are known as *grundlawinen*. Another type (*staublawnen*) occurring in the winter season is characterized by the dry and finely divided condition of the snow, and results from the overloading of the snow-fields. A third class is the ice-avalanche, occurring along the course of glaciers. Avalanches are often very destructive, sweeping away trees, houses and everything in their path. Their destructive effects are greatly increased by the wind-blasts which accompany them. Those occurring in winter usually cause the greatest loss of life, as they develop suddenly and without warning; those that take place in spring generally follow a definite path and are more or less regular in their occurrence. The planting of forests on the high slopes sometimes affords protection from avalanches, but when this is not feasible, stone structures are employed.

Aval Islands. See **BAHREIN**.

Av'alón, Cal., a summer resort on Santa-Catalina Island, established for the purpose of supplying the comforts of life at a minimum cost. It is owned by a joint stock company, and was literally built to order when it was determined to build the town. The sight selected was a desert, with not a tree in sight and only a few shanties of fishermen along shore. Water was found in a neighboring cañon to the north and piped over the hills. The ground was leveled, the hollows filled, and small prominences cut down. The surveyor platted the tract, laid out streets, avenues, walks, and a central plaza or park with provision for fountains. This accomplished, the plumbers followed, and a system of sewerage and water pipes was introduced. The aid of the forester

was next called into play, and the streets and avenues were planted with small Australian eucalyptus trees. A wharf was built, a hotel or restaurant, several cottages for the superintendent, a number of tents erected, and what is known as the "tent city" was finished. The tent city is a feature peculiar all along the southern California coast, for the benefit of ranchers and others from the inland cities and towns who desire to escape the heat and enjoy life at the seashore at a minimum cost.

What is known as the "tent city" is more or less peculiar to California, and the local papers, from the heart of the Sierras to the sands of the ocean, during the summer months, all contain glowing advertisements of the "tent city." Such cities, with a population of several hundred, are found at many points on the Pacific coast. The equipment of the "tent city" constitutes a business in itself. At Avalon is a large circus tent which in winter contains furniture of every description. Here, in fact, the "tent city" was in winter quarters, everything being classified and arranged with order and system. In April or May a gang of workmen descends upon the winter quarters, and like magic the vacant lots are filled, and in a day a city is reared as though by the touching of the proverbial button. Each tent is neatly and well furnished, and can be rented for a nominal cost, the owners of the island giving the ground rent and free water, each lot being sewered and perfect in its sanitary arrangement. The visitor can rent a tent for sleeping, a parlor and kitchen, or he can rent a single room. In the centre of the "tent city" is a store where every description of food, carefully prepared and cooked, can be obtained. Near by the Y. M. C. A. has opened a reading room and library.

The questions of the physical and moral welfare of such a community would seem an important and difficult one to manage, but all this and even the amusements are included in the plan, and we have a city where every door is open and where probably the jail is used hardly once in the season. On the borders of the city is a large amusement hall, and in the neighboring grove is a band stand where the finest band in southern California gives an open-air concert from 7 until 9, seats being provided for 1,200 people. No smoking is allowed within the area of the seats. At the end of the concert the band adjourns to the "pavilion," and a ball is given free to the inhabitants of the "tent city" and others. No policeman is in evidence in the town, though guardians of the peace are present in citizen's clothes. In fact, here is a summer municipality of large size, conducted by a corporation that attends to everything; keeps the town clean, provides amusement, sustains a health officer, administers justice through a justice of the peace, provides the government with a post-office, and maintains two daily boats between the island and the mainland—an experiment in government worthy the attention of the pessimist who affects to believe that communities cannot be run by machinery, as this virtually is, so well arranged and systematized are the methods. It might be assumed that a series of stringent and excessive taxes would be imposed upon each resident, but investigation shows that each resident of the tent city of Avalon pays but \$2.75 per capita per season for the privileges, which is the

AVALON — AVELLANEDA

cost of round trip fare from Los Angeles to the island, a distance of 50 miles, more or less. This and the rent of tent constitute the sole tax. The winter population is generally less than 1,000, but in summer 75,000 persons are to be found at times living within the corporate limits.

Av'alon, the legendary elysium of King Arthur, being his abode after disappearing from the haunts of men; called also *Avilion*. The name is also identified with Glastonbury, and has been given to a peninsula of Newfoundland.

Avalos, á'vā-lōs', the name of a noble Neapolitan family, which included Ferdinand D' Avalos, Marquis de Pescara: b. Naples, 1490; d. 1525. He served with distinction in the army of Charles V., and was taken prisoner by the French at the battle of Ravenna in 1512. He beguiled the hours of captivity by writing a 'Dialogue of Love,' which he dedicated to his wife, the beautiful and accomplished Vittoria Colonna. He soon recovered his liberty, and subsequently displayed extraordinary ability in the wars of Charles V.

Avare, L', la-vār' (The Miser), the title of one of the most famous of Molière's prose comedies, first produced 9 Sept. 1668. It is founded on the 'Aulularia' of Plautus, and was paraphrased by Fielding in his comedy of 'The Miser.' Harpagon is a sexagenarian miser who incarnates the spirit of avarice and has determined to marry a young woman named Mariane, but ultimately prefers his gold to matrimony.

Ava'ris, a city of ancient Egypt, by some writers identified with Tanis, the modern Sān, and once the capital of the Shepherd Kings.

Avars, ä'vārz, or **Avares**, a nation of Mongolian or Turkish origin, who at an early period migrated to the regions around the Don, the Caspian Sea, and the Volga. They served in Justinian's army, and later made themselves masters of Dalmatia, pressed into Thuringia and Italy, where they fought with the Franks and Lombards, and extended their dominion over the Slavonians dwelling on the Danube and farther north, as well as over the Bulgarians on the Black Sea. They were at length overcome by Charlemagne, and after 827 disappear from history; but the valley of Erlav, a small tributary of the Danube in Lower Austria, was called, the "land of the Avars" as late as the 10th century.

The name is also borne by a tribe estimated to number upward of 100,000, now living in the Caucasus Mountains, noted for their struggle with Russia, in which they were led by Schamyl (q.v.). See also LESGHIAN.

Avatar, äv'a-tār', in Hindu mythology, an incarnation of the Deity. Ten avatars are peculiarly distinguished, and four of them are the subjects of *Purānas*, or sacred poems. These 10 are among the incarnations of Vishnu, the supreme God. The Matsya avatar was the descent of the Deity in the form of a fish; Kachyapa or Kūrma, in that of a tortoise; Varāha, as a boar; Nara-sinha, as a monster, half man, half lion; Vāmana, as a dwarf; Parasurama, as the son of Jamadagni. All these took place in the *Satya Yuga*, or golden age. The seventh

incarnation was in the form of the four sons of King Dasaratha, under the names of Rāma, Lakshmana, Bharata, and Satrugna, in order to destroy certain demons that infested the earth. The achievements of Rāma form the subject of the celebrated epic called the *Rāmāyana*. The eighth avatar of Vishnu, in the form of Krishna, is the best known of all, from the fact that it forms the subject of the great Sanskrit epic poem, the *Mahābhārata*. Its object was to relieve the earth from the Daityas, and the wicked men who oppressed it. The ninth was in the form of Buddha. The Kalki, or tenth avatar, is yet to come at the end of the *Kali Yuga*, or the iron age. See VISHNU.

Avatcha, a-vā'cha, a volcano and bay in Kamchatka. The volcano, 9,000 feet high, was last active in 1855. The town of Petropavlovsk is situated on the bay.

Ave Maria, a'vā mā-rē'a (Latin; hail Mary, from *avere*); among the Roman Catholics the beginning of a prayer to the Virgin, whence the whole prayer is called *Ave Maria*. It is the beginning of the salutation which the angel addressed to the Virgin, as he announced to her that she should be the mother of the Saviour (Luke i. 28; "Hail, highly favored, the Lord is with thee; blessed art thou among women"). See ROSARY.

Avebury, ä'ber-ī, Lord. See LUBBOCH, SIR JOHN.

Ave'bury, England, a village in Wiltshire, occupying the site of a so-called Druidical temple, which originally consisted of a large outer circle of 100 stones, from 15 to 17 feet high, and about 40 feet in circumference, surrounded by a broad ditch and lofty rampart, and enclosing two smaller circles. On the neighboring downs are numerous barrows or tumuli, one of which, called Silbury Hill, rises to the height of 130 feet, with a circumference of 2,027 feet at the base, covering an area of more than five acres.

Aveiro, a-vā'e-rō, a seaport town in Portugal, 35 miles south of Oporto. It is a bishop's see, and contains a cathedral. Aveiro has manufactures of earthenware, and salt is made in great quantities from the lagoons in the neighborhood. A thriving trade is carried on in oil, wine, and oranges. Pop. (1890) 10,000.

Avellaneda, a-vā'lya-nā'da, **Alfonso Fernandes de**, the pseudonym of the writer of a sequel to 'Don Quixote,' issued prior to the sequel by Cervantes. See DON QUIXOTE.

Avel'lane'da, Nicholas, Argentine statesman: b. Tucuman, 1 Oct. 1836; d. 26 Dec. 1885. He was professor of political economy in the University of Buenos Ayres; minister of public instruction in 1868-74, and president of the republic in 1874-1886. He published several historical and economical works.

Avellaneda y Arteaga, a-vā'lya-nā'da ē ār'tā-ā'ga, **Gertrudis Gomez de**, distinguished Spanish poet, dramatist and novelist: b. Puerto Principe, Cuba, 23 March 1814; d. Madrid, 2 Feb. 1873. Under the pseudonym Peregrina she contributed to Andalusian journals many 'Lyric Poems' (1851-54), and afterward wrote a series of spirited novels: 'Two Women,' 'The Baroness de Joux,' 'Dolores,' and others. She gained still higher distinction with the tragedies 'Alfonso Munio,' the hero

THE CURVING BEACH AT AVALON, SANTA CATALINA, CALIFORNIA.

AVELLINO—AVERNUS

of which was her own ancestor, and 'The Prince of Vianna.' Her later compositions had a tone of melancholy; among these are Biblical dramas, as 'Saul' and 'Balthasar'; the spiritual song, 'At the Cross,' and 'The Last Ascent of My Harp' (1850). In the later years of her life she composed 16 plays which still have a place on the Spanish stage.

Avellino, à'vèl-lè'nō, a town in Italy, 29 miles east of Naples. It has a square adorned with an obelisk, and possesses several agreeable promenades. Pop. (1901) 23,700

Ave'na. See OAT.

Avenarius, Richard, German philosopher: b. Paris 1843; d. Zurich 1896. He studied philosophy at the universities of Zurich, Berlin, and Leipzig, and from 1877 to his death was professor of philosophy at Zurich. He wrote on Spinoza's pantheism, published a theory of experience and contributed many papers to magazines and reviews, upon philosophical subjects.

Avenches, à-vànsh', Switzerland, a town in the canton of Vaud, seven miles northwest of Fribourg. It is the ancient Aventicum, capital of Helvetia under Roman rule, and is noted for its Roman relics, notably the ruins of an amphitheatre, and a Corinthian column belonging to a temple of Apollo. In Roman times it was a city of 20,000 inhabitants. The population now is about 2,000.

Av'ene!, Mary, a character appearing in Scott's novels, 'The Monastery' and 'The Abbot.'

Avenel, àv-nèl', **Paul**, a French poet and novelist: b. Chaumont 9 Oct. 1823. He was active in connection with several periodicals, and besides several vaudevilles, he wrote 'The Peasant Woman from the Abruzzi' (1861), a drama; 'The King of Paris' (1860), a historical romance; 'The Calicoes' (1866), scenes of real life. Among several collections of poems may be mentioned 'Alcove and Boudoir,' interdicted in 1855 and re-published in 1885.

Aven'ger of Blood, among primitive peoples the next of kin to a murdered man, upon whom was laid the duty of avenging the crime by killing the murderer. In this custom may be detected the source of the system of criminal law.

Av'entine, the southernmost of the seven hills of Rome, on the left bank of the Tiber, between the river and the Cælian hill. The Circus Maximus lay to the northeast of the Aventine, between it and the Palatine, and the baths of Caracalla were on the southeast.

Aven'turine. See QUARTZ; SUNSTONE.

Avenzoar, à'vèn-zō'ar, or more correctly, **Abu-Merwan-Mohammed - ben - Abdalmalec - ben-Zohar**, Arabian physician of the 12th century: b. Seville, Spain; d. Morocco, 1169. He became eminent in his profession, traveled much, and passed through many adventures, among which was a long imprisonment at Seville. He had the care of a hospital, and composed a work entitled 'Al Theiser,' containing a compendium of medical practice, and including many facts and observations not found in the preceding writers, which was probably the result of his own experience. The report of his having lived to the age of 135 is probably an error arising from his having been con-

founded with his son, of the same name and profession, who lived at Morocco, and was the author of a treatise on the regimen of health.

Av'rage, in maritime law, is general, particular or petty. General average (also called gross) consists of expense purposely incurred, sacrifice made, or damage sustained for the common safety of the vessel, freight and cargo, or the two of them, at risk, and is to be contributed for by the several interests in the proportion of their respective values exposed to the common danger, and ultimately surviving, including the amount of expense, sacrifice or damage so incurred in the contributory value. Indemnity for general average loss is ordinarily stipulated for in policies against the risks in navigation, subject, however, to divers modifications and conditions. Under maritime policies in the usual form, insurers are liable for the contributions, for loss by jettison of cargo, sacrifice of cables, anchors, sails, boats, delay for the purpose of refitting, voluntary stranding, etc. Average particular (also called partial loss) is a loss on the ship, cargo or freight, to be borne by the owner of the subject on which it happens, and is so called in distinction from general average, and, if not total, it is also called a partial loss. It is insured against in marine policies in the usual forms on ship, cargo or freight, when the action of peril is extraordinary, and the damage is not mere wear or tear, and on the ship covers loss by sails split or blown away, masts sprung, machinery of steamship disabled, planks started, change of shape by strain, loss of boat, breaking of sheathing or upper works or timbers, damage by collision or stranding, by lightning or fire, or in defense against pirates or enemies, or by hostile or piratical plunder. Petty average consists of small charges formerly assessed upon the cargo, to wit: anchorage, pilotage, beaconage, towage, quarantine, etc.

Av'rage Man, An, a society novel by Robert Grant. It is a story of manners rather than plot, concerning itself more with types than with individuals.

A'verell, William Woods, American military officer: b. Cameron, N. Y., 5 Nov. 1832; d. Bath, N. Y., 3 Feb. 1900. He was educated at West Point, and served on the frontier, and in several Indian campaigns till the beginning of the Civil War, when he was appointed colonel of the Third Pennsylvania Cavalry, and assigned to the command of the cavalry defenses of Washington. During the war he distinguished himself on numerous occasions as a cavalry raider and commander, and at its close was brevetted major-general of volunteers. He resigned from the regular army while holding the rank of captain, in 1865, and, under an act of Congress, was reappointed captain in August 1888, and was placed on the retired list in the same month. He was United States Consul-General at Montreal in 1866-9. He invented a system of asphalt pavement now quite generally adopted and the Averell insulating conduits for wires and conductors.

Avernus, a-vèr'nūs, a small circular lake, now called *Lago d'Averno*, in Naples, kingdom of Italy, between the ancient Cumæ and Puteoli. It is surrounded by hills of a moderate height, which used to be covered with immense woods,

AVERROES—AVESTA

while the atmosphere was charged with unhealthy mephitic effluvia, and occupies the crater of an extinct volcano. By ancient Greek writers, subsequent to Homer, it was fabled to be the entrance to the infernal regions, and to have been the place where Ulysses entered in his visit to the shades. It was also thought that the Cimmerians of Homer dwelt on the banks of this lake. The sibyl of Cumæ is said to have had her grotto here, and Virgil represents her as guiding Æneas when he made his descent ("*facilis descensus Averno*") to the infernal regions at this place.

Averroes, av-er-rōs' (corrupted from *Ebn* or *Ibn Roshd*), a renowned Arabian philosopher: b. Cordova, Spain, 1126; d. about 1198. He became a *cadi* or judge first in Seville and afterward in Cordova. He was accused of rejecting the established religion, and in consequence deprived of his offices, and fled to Fez. Here he was condemned by a spiritual court to recant and undergo a public penance. Upon this he went back to his own country, but was latterly restored to his dignities in Morocco. Averroes regarded Aristotle as the greatest of all philosophers, and explained his writings, with only a slight deviation from his views. Besides commentaries on Aristotle and other philosophical works he wrote also a compendium of physic, called '*Colliget*' (a corruption of the Arabic '*Kulliyat*,' or summary), and treatises on jurisprudence, astronomy, grammar, etc. His commentaries upon Aristotle, in a Latin translation, were repeatedly printed at Venice in the 15th and 16th centuries. His '*Colliget*' also was early translated into Latin, and several times printed. See Renan, '*Averroes et l'Averroïsme*' (1860); Muller, '*Philosophie und Theologie von Averroes*' (1875).

Aversa, a-vēr'sa, a town of Italy, nine miles north of Naples, on a plain covered with vines and orange trees. It is the seat of a bishop, and is famed for a kind of almond-cake, called *torrone*, in great demand at Naples. Pop. (1901) 23,477.

A'very, Benjamin Parke, American journalist and diplomatist: b. New York 1829; d. Peking, China, 8 Nov. 1875. He went to California in 1849 and became connected with several papers on the Pacific coast, among them the *San Francisco Bulletin*. In 1872 he was appointed editor of the '*Overland Monthly*.' From 1874 to 1875 he was United States minister to China. His chief work is '*Californian Pictures in Prose and Verse*' (1877).

A'very, Elroy McKendree, American writer: b. Erie, Mich., 1844. He served in the Federal army during the Civil War, and has since been prominent in educational matters. Among his many published works are textbooks in physics and chemistry, '*Words Correctly Spoken*' (1887); and '*A Popular History of the United States*,' now in progress of publication.

Avery, Otis, American dentist: b. Bridgewater, Oneida County, N. Y., 19 Aug. 1808; d. Honesdale, Pa., 1904. He then took up the study of dentistry, and began the practice of his profession at Honesdale, Pa., where he lived for the greater part of his life. For some years he was the only dentist between Honesdale and Utica, N. Y., and at the time of his death was the oldest practising dentist in the United States.

A'very, Samuel Putnam, American merchant: b. New York, 17 March 1822. He became a copper-plate and wood engraver, and subsequently an art publisher and dealer, and retired from business in 1888. He was a founder of the Metropolitan Museum of Art; life member of the American Museum of Natural History, American Geographical Society, American Historical Society, American Zoological Society; president of the Grolier Club, and first president of the Sculpture Society. In 1891, with his wife, he created and endowed the Avery Architectural Library, in Columbia University, as a memorial of his deceased son; and in May 1900 presented to the trustees of the New York Public Library a collection of etchings, lithographs, and photographs, numbering more than 17,500 pieces, together with a number of large volumes illustrated by the same arts.

A'very, Waitstill, American lawyer. b. Norwich, Ct.; d. North Carolina, 1821. He practised his profession successfully; was appointed in 1777 attorney-general of North Carolina, and was at the time of his death the patriarch of the bar of that State. He was prominent in the political affairs of the State, being a member of the State congress prior to the Revolution, and of the State legislature after the establishment of peace. In 1777 he was appointed one of a commission to treat with the Cherokee Indians.

A'very's Gores, the name of several tracts of land in Vermont, granted to Samuel Avery in 1791. One of them is in Addison County, nearly on the summit of the Green Mountains, now forming a part of Granville.

Aves, a'vās, or **Bird Islands**, a group of small islands belonging to Venezuela, valuable for their deposits of guano.

Aves, ā'vēz, the class of vertebrated animals which contains the birds. They have been defined by Dr. Gadow as "oviparous, warm-blooded, amniotic vertebrates, which have their anterior extremities transformed into wings." The metacarpus and fingers carry feathers or quills; there is an intertarsal joint, and the feet have not more than four toes, of which the first is the hallux. See **BIRDS**.

Aves'ta, or **Zend-Avesta**, the Bible of Zoroaster, the sacred book of ancient Iran, and holy scripture of the modern Parsis. The exact meaning of the name "*Avesta*" is not certain; it may perhaps signify "law," "text," or, more doubtfully, "wisdom," "revelation." The modern familiar designation of the book as *Zend-Avesta* is not strictly accurate; if used at all, it should rather be *Avesta-Zend*, like "*Bible and Commentary*," as *sand* signifies "explanation," "commentary," and *Avesta u Zand* is employed in some Persian allusions to the Zoroastrian scriptures as a designation denoting the text of the *Avesta* accompanied by the Pahlavi version or interpretation. The story of the recovery of the *Avesta*, or rather the discovery of the *Avesta*, by the enthusiastic young French scholar, Anquetil du Perron, who was the first to open to the western world the ancient records of Zoroastrianism, reads almost like a romance. Du Perron's own account of his departure for India in 1754, of his experiences with the *dasturs* (or priests) during a seven years' residence among them, of his various

AVESTA

difficulties and annoyances, setbacks, and successes, is entertainingly presented in the introductory volume of his work 'Zend-Avesta, *Ouvrage de Zoroastre*' (1771). This was the first translation of the ancient Persian books published in a European language. Its appearance formed one of those epochs which are marked by an addition to the literary, religious, or philosophical wealth of our time; a new contribution was added to the riches of the West from the treasures of the East. The field thus thrown open, although worked imperfectly at first, has yielded abundant harvests to the hands of later gleaners. With the growth of knowledge of the language of the sacred texts, we have now a clear idea also of the history of Zoroastrian literature, and of the changes and chances through which with varying fortunes the scriptures have passed. The original Zoroastrian Avesta, according to tradition, was in itself a literature of vast dimensions. Pliny, in his 'Natural History,' speaks of two million verses of Zoroaster; to which may be added the Persian assertion that the original copy of the scriptures was written upon twelve thousand parchments, with gold illuminated letters, and was deposited in the library at Persepolis. But what was the fate of this archetype? Parsi tradition has an answer. Alexander the Great,—“the accursed Iskander,” as he is called,—is responsible for its destruction. At the request of the beautiful Thais, as the story goes, he allowed the palace of Persepolis to be burned, and the precious treasure perished in the flames. Whatever view we may take of the different sides of this story, one thing cannot be denied: the invasion of Alexander and the subjugation of Iran was indirectly or directly the cause of a certain religious decadence which followed upon the disruption of the Persian empire, and was answerable for the fact that a great part of the scriptures was forgotten or fell into disuse. Persian tradition lays at the doors of the Greeks the loss of another copy of the original ancient texts, but does not explain in what manner this happened; nor has it any account to give of copies of the prophet's works which Semitic writers say were translated into nearly a dozen different languages. One of these versions was perhaps Greek, for it is generally acknowledged that in the 4th century B.C. the philosopher Theopompus spent much time in giving in his own tongue the contents of the sacred Magian books.

Tradition is unanimous on one point at least: it is that the original Avesta comprised 21 *Nasks*, or books, a statement which there is no good reason to doubt. The same tradition which was acquainted with the general character of those *Nasks* professes also to tell exactly how many of them survived the inroad of Alexander; for although the sacred text itself was destroyed, its contents were lost only in part, the priests preserving large portions of the precious scriptures. These met with many vicissitudes in the five centuries that intervened between the conquest of Alexander and the great restoration of Zoroastrianism in the 3d century of our era, under the Sassanian dynasty. At this period all obtainable Zoroastrian scriptures were collected, the compilation was codified, and a detailed notice made of the contents of each of the original *Nasks* compared with the portions then surviving. The

original Avesta was, it would appear, a sort of encyclopædic work; not of religion alone, but of useful knowledge relating to law, to the arts, science, the professions, and to every-day life. If we may judge from the existing table of contents of these *Nasks*, the zealous Sassanians, even in the time of the collecting (226–380 A.D.), were able to restore but a fragment of the archetype, perhaps a fourth part of the original Avesta. Nor was this remnant destined to escape misfortune. The Mohammedan invasion, in the 7th century of our era, added a final and crushing blow. Much of the religion that might otherwise have been handed down to us, despite “the accursed Iskander's” conquest, now perished through the sword and the Koran. Its loss, we must remember, is in part compensated by the Pahlavi religious literature of Sassanian days.

Fragmentary and disjointed as are the remnants of the Avesta, we are fortunate in possessing even this moiety of the Bible of Zoroaster, whose compass is about one tenth that of our own sacred book. A grouping of the existing texts is here presented: (1) *Yasna* (including *Gathas*); (2) *Visperad*; (3) *Yashts*; (4) *Minor Texts*; (5) *Vendidad*; (6) *Fragment*s.

Even these texts no single manuscript in our time contains complete. The present collection is made by combining various Avestan codexes. In spite of the great antiquity of the literature, all the existing manuscripts are comparatively young. None is older than the 13th century of our own era, while the direct history of only one or two can be followed back to about the 10th century. This mere external circumstance has of course no bearing on the actual early age of the Zoroastrian scriptures. It must be kept in mind that Zoroaster lived at least six centuries before the birth of Christ.

Among the six divisions of our present Avesta, the *Yasna*, *Visperad*, and *Vendidad* are closely connected. They are employed in the daily ritual, and they are also accompanied by a version or interpretation in the Pahlavi language, which serves at the same time as a sort of commentary. The three divisions are often found combined into a sort of prayer-book, called *Vendidad-Sadah* (*Vendidad Pure*); that is, Avesta text without the Pahlavi rendering. The chapters in this case are arranged with special reference to liturgical usage.

Some idea of the character of the Avesta as it now exists may be derived from the following sketch of its contents and from the illustrative selections presented:

1. *Yasna* (sacrifice, worship), the chief liturgical work of the sacred canon. It consists mainly of ascriptions of praise and of prayer, and corresponds nearly to our idea of a prayer-book. The *Yasna* comprises 72 chapters; these fall into three nearly equal parts.

The greater part of the *Yasna* book is of a liturgic or ritualistic nature, and need not here be further described. Special mention, however, must be made of the middle section made up by “the Five *Gathas*” (hymns, psalms), a division containing the 17 sacred psalms, sayings, sermons, or teachings of Zoroaster himself. These *Gathas* form the oldest part of the entire canon of the Avesta. In them the prophet of the new faith is speaking with the fervor of the Psalmist of the Bible. In them we feel

AVEYRON—AVIGNON

the thrill of ardor that characterizes a new and struggling religious band; we are warned by the burning zeal of the preacher of a Church militant. Now, however, comes a cry of despondency, a moment of faint-heartedness at the present triumph of evil, at the success of the wicked and the misery of the righteous; but this gives way to a clarion burst of hopefulness, the trumpet note of a prophet filled with the promise of ultimate victory, the triumph of good over evil. The end of the world cannot be far away; the final overthrow of Ahriman (Anra Mainyu) by Ormazd (Ahura Mazda) is assured; the establishment of a new order of things is certain; at the founding of this "kingdom" the resurrection of the dead will take place and the life eternal will be entered upon.

The *Visperad* (all the masters) is a short collection of prosaic invocations and laudations of sacred things. Its 24 sections form a supplement to the Yasna. Whatever interest this diversion of the Avesta possesses lies entirely on the side of the ritual, and not in the field of literature. In this respect it differs widely from the book of the Yashts, which is next to be mentioned.

Yashts (praises of worship) form a poetical book of 21 hymns, in which the angels of the religion, "the worshipful ones" (*Yasatas*, *Icads*), are glorified, and the heroes of former days. Much of the material of the Yashts is evidently drawn from pre-Zoroastrian sagas which have been remodeled and adopted, worked over, and modified, and incorporated into the canon of the new-founded religion. There is a mythological and legendary atmosphere about the Yashts, and Firdausi's 'Shah Nameh' serves to throw light on many of the events portrayed in them, or allusions that would otherwise be obscure. All the longer Yashts are in verse, and some of them have poetic merit. There are several translations of the Avesta. The best (except for the Gathas, where the translation is weak) is the French version by Darmesteter, 'Le Zend Avesta,' published in the 'Annales du Musée Guimet'. An English rendering by Darmesteter and Mills is contained in the 'Sacred Books of the East,' Vols. IV, XXIII., XXXI.

Aveyron, a'vā-rōn', a department in the south of France. It is extremely mountainous, and is traversed by five considerable rivers, the Aveyron, after which the department is named, the Viaur, the Truyère, the Lot, and the Tarn. Of these, the only one navigable within the department is the Lot. It is only in the west that plains of any considerable extent are found. Agriculture is in a very defective state, but considerable attention is paid to sheep-breeding. Cheese of an excellent quality is made and exported in large quantities. Aveyron possesses valuable coal, iron, and copper mines, besides other minerals. Pop. (1901) 377,559.

Aviary, a house or enclosure, larger than an ordinary cage, for living birds. Out-of-door aviaries are common in the warm countries of southeastern Europe and in Asia, and are also quite numerous in England. The freedom of motion possible for a bird in a good-sized aviary helps to keep them in good condition, and many species which are unable to bear the close confinement of a cage flourish in the larger en-

closures. In a climate like that of the United States, where the extremes of temperature are great, outdoor aviaries are uncommon except in zoological gardens. In the New York Zoological Park is an aviary built in 1900, measuring 153 feet long, 72 feet wide, and 55 feet high; at present this is the largest in the world. It is a wire cage, in the shape of a pointed arch, supported by steel frames. It stands among trees, and several are enclosed by it. Game birds, herons, and other large species live in this aviary, and many smaller species, which would suffer out of doors in winter, dwell there during the summer months. See **CAGE-BIRDS**.

Avicebron, a-ve'thā-brōn', **Solomon ben Jehuda ibn Gabriol**, Hebrew poet and philosopher. b. Cordova, about 1028; d. about 1058. Of his poetical works, 'The Royal Crown' is the most famous; of the philosophical, 'The Fountain of Life,' written in Arabic, but known only through a Latin translation (re-edited in Munster, in 1895).

Avicenna, Arabian philosopher and physician: b. near Bokhara, 980 A.D.; d. 1037. He completed his studies at the early age of 18, and began to practise as a physician. He settled subsequently at Hamadan, at first as physician to a noble lady, afterward as vizier of the emir. On the death of his patron his son and successor refused to recognize him as vizier, and accordingly he lived in retirement at Hamadan. Going in later life to Ispahan, he passed in quietness the last 14 years of his life, and composed the greater part of his works on medicine, logic, metaphysics, astronomy, and geometry. Avicenna left many writings, mostly commentaries on Aristotle. Of his medical works, the principal is called 'Canon of Medicine,' founded on the Greek writers, and in some parts of the East is still an authority. It has been printed in the original Arabic, and there have been many Latin translations of it. His other works have also appeared in translations.

Avicennia, or **White Mangrove**, a genus of *Verbenacea*, consists of trees or large shrubs resembling mangroves, and, like them, growing in tidal estuaries and salt marshes. Their creeping roots, often standing six feet above the mud in crowded pyramidal masses, and the naked asparagus-like suckers which they throw up, have a singular appearance. The bark of *A. tomentosa*, the white mangrove of Brazil, is much used for tanning. A green, resinous substance exuding from *A. resinifera* is eaten by the New Zealanders. The genus is named in memory of the Arabian physician, Avicenna (q.v.).

Avienus, **Rufus Festus**, Latin descriptive poet, who flourished about the end of the 4th century after Christ, and wrote 'Descriptio Orbis Terræ,' a general description of the earth; 'Ora Maritima,' an account of the Mediterranean coasts, etc.

Avignon, a've-nyōn' (ancient *Avenio*), a French city, capital of the department Vaucluse, on the left bank of the Rhone. It consists generally of large antique houses, in narrow, crooked, dirty streets. The principal objects of interest are the large and very ancient cathedral; the papal palace, with lofty massive walls and strong towers, and the chamber of the Inquisition. The silk manufacture is the

AVILA—AVON

principal source of employment at Avignon, and the rearing of silkworms is carried on extensively in the district. The city has also manufactories of velvet, woolen, and other goods, hats, jewelry, etc., with silk dye-works, paper-mills, tanneries, etc., and a trade in wine, brandy, iron, cotton, wool, grain, and other articles, of which it is the entrepôt for Lower Dauphiné, Provence, and all Languedoc. Here Petrarch lived several years; here he saw his Laura, who formed the subject of his most beautiful verses, and whose tomb is still to be found in the Franciscan Church. The fountain of Vaucluse is five leagues from Avignon. It belonged to the papal see from 1348 to 1791, and from March 1309 to September 1376 seven Popes in succession, from Clemens V to Gregory XI., were compelled to reside in this city. The Catholic historians commonly call this period the Babylonish captivity of the Popes. Near Avignon are found many Roman antiquities. Pop. (1896) 45,107.

Avila, a've-la, **Gil Gonzalez d'**, Spanish antiquary and biographer: b. 1577; d. 1658. He was made historiographer of Castile in 1612, and of the Indies in 1641. Most valuable works: 'Teatro de las Grandezas de Madrid' (1623); and 'Teatro Ecclesiastico' (1645-53).

Avila, Juan de, celebrated Spanish preacher, commonly called the "Apostle of Andalusia"; b. Almodavar del Campo, 1500; d. 1569. His missionary labors in Andalusia were prosecuted with untiring zeal and singular success, until he arrived at the age of 50, when, with a worn-out constitution, he was obliged to desist. His 'Spiritual Letters' have been translated into most European languages.

Avila y Zuniga, a've-lā e thoo'nye-ga, **Don Luis d'**, Spanish general, diplomatist, and historian; a favorite of Charles V.: b. about 1490; d. after 1552. His chief work, translated into five or six languages, was on the war of Charles V. in Germany.

Avila, a town of Spain, the capital of the province of Avila, a modern division of Old Castile. It is the see of the bishop suffragan of Santiago, with a fine cathedral, and was once one of the richest towns of Spain. Principal employment in the town is spinning; in the province, breeding sheep and cattle. Pop. (1897) 11,700.

Aviles, a've-lās', a town of northern Spain, 19 miles from Oviedo. It has a good harbor and a considerable trade in copper and wine. Pop. (1897) 12,100.

Avison, Oliver R., English physician: b. Yorkshire, 30 June 1860. He removed to Canada in youth, and became professor of materia medica, instructor of microscopy and demonstrator of materia medica in the University of Toronto. In 1893 he went to Korea as a medical missionary; the same year he was appointed to the charge of the Royal Korean Hospital, and in the following year became physician to the royal family.

Avitus, Marcus Mæcilius, an emperor of the West. He belonged to a Gaulish family in Auvergne, and gained the favor of Constantius, the colleague of Honorius, and of Theodoric, king of the Visigoths. He served with distinction under Ætius, became Prefect of Gaul, and concluded a favorable treaty with the Goths.

He afterward retired into private life until the invasion of Attila, when he induced the Goths to join the Romans against the common enemy. Avitus was proclaimed emperor in 455, took for his colleague Marcianus, and died the year following.

Aviz, a vesh, **Order of**, a Portuguese order of knighthood, created in 1147 by Alphonso I. The knights were then called Knights of Evora, but took their present title, in 1287, from their gallant defense of the fortress of Aviz against the Moors. The order was changed from an ecclesiastical to a civil institution in 1789. The king of Portugal is the grand master of the order.

Avlona, av-lō'na, a seaport in Albania, protected by the island of Sasseno, the ancient Saso. It is one of the stations of the Austrian Lloyd steamers, and carries on considerable trade with Brindisi, etc. The Christian inhabitants, chiefly Italians, are engaged in commerce, exporting oil, wool, salt, pitch, and especially some 40,000 tortoise shells yearly. The Turks are employed in the manufacture of weapons and woolen fabrics. Valonia, a material imported to England for tanning, is the pericarp of an acorn grown in the neighborhood. Up to 1691 the town belonged to the Venetians. Pop. about 6,000.

Avoca, or **Ovoca**, a beautiful valley and river of Ireland, near Glendalough, in the county of Wicklow, and celebrated as being the scene which gave rise to one of the finest of Moore's 'Irish Melodies'. Avoca is also the name of a village in the town of Bath, Steuben County, N. Y.

Avocado (äv'ō-kā'dō) **Pear**, a tropical fruit. See ALLIGATOR PEAR.

Avocet, a shore-bird of the limicoline genus *Recurvirostra*, remarkable for its very slender beak, which curves upward toward the end like a cobbler's awl. It is a near relative of the stilt sandpiper, and various species occur throughout the world. The North American species, *Recurvirostra americana*, is found in summer throughout the temperate parts of the country, migrating to the tropics in winter. It is about 17 inches in length, brownish-black above and white below, with the head, neck, and chest light cinnamon. Its general habits are those of sandpipers.

Avoga'dro's Law, a rule laid down by Amedeo Avogadro, an Italian physicist: b. Turin 1776; d. 1856. See ATOMIC THEORY.

Avoidupois, äv'er-dū-pois' (French *avoir du poids*, to have weight), a system of weights and measures in which a pound contains 7,000 grains or 16 ounces, while a pound troy contains 1,760 grains or 12 ounces. All larger and coarser commodities are weighed by avoidupois weight. The avoidupois ounce is less than the troy ounce in the proportion of 72 to 79.

Avola, ä'vō-la, a seaport on the east of Sicily, 20 miles southwest of Syracuse, with a trade in almonds, sugar, etc. Pop. (1901) 16,264.

Avon, ä'vön, the name of several rivers in England, the most important of which are the following: (1) The Upper Avon, rising in Leicestershire, runs southwest, and falls into the Severn at Tewkesbury. Stratford-on-Avon,

AVONDALE — AXE

a town on this river, is the birthplace of Shakespeare; (2) the Lower Avon, which rises near Tetbury, in Gloucestershire, and falls into the Severn northwest of Bristol, being navigable as far as Bath; (3) in Monmouthshire; (4) in Wiltshire and Hampshire, enters the English Channel at Christchurch Bay, in the latter county.

Avondale, a parish of Scotland, in the county of Lanark. At the battle of Drumclog, fought near this place 1 June 1679, Grahame of Claverhouse, the famous Viscount Dundee, was defeated by the forces of the Scottish Covenant. A graphic description of this battle is found in Sir Walter Scott's 'Old Mortality.'

Avranches, a-vrānsh' (ancient *Abrincæ*), a town in France, about 3 miles from the Atlantic, and 30 miles east of St. Malo. It is pleasantly situated at the end of a long ride, the summit of which was crowned by a magnificent cathedral; built in the 11th century, and destroyed at the revolution. In this cathedral Henry II. did penance before two of the Pope's legates for the murder of Thomas à Becket. One of its bishops was the celebrated Huet, author of the 'Demonstratio Evangelica.' The manufactures are chiefly lace, white thread, and wax candles, and there is some trade in agricultural produce. Pop. (1896) 7,600.

Avulsion (Latin, *avulsion*, a tearing off), a term denoting the sudden transfer by natural causes of a portion of one man's land to that of another, as when the course of a river is suddenly changed and former boundaries altered. It differs from accretion, which describes a gradual addition to the property of a riparian owner by the action of the water. See ALLUVION.

Awaji, a-wa'jē, one of the islands of Japan, situated between the main island and Sikokee. Its area is 218 square miles. Pop. 170,000.

Award is the judgment or decision of arbitrators or referees, on a matter submitted to them. The award should be consonant with and follow the submission, to be binding. It must be final and certain. It must be possible to be performed, and must not direct anything illegal to be done. At common law an award could be oral or written, but in some of the States an award to be valid must be in writing. The New York Code Civil Procedure provides that an award to be valid must be in writing. See ARBITRATION AND AWARD.

Awata (a-wā'ta) **Ware**, a yellow faience called "egg-ware" by the Japanese, manufactured in the village of Awata, a suburb of Kioto, and largely purchased in the United States.

Awe, â, a narrow Scottish lake in Argyshire, about 28 miles long, and communicating by the Awe with Loch Etive. It is of great depth, has sloping and well-cultivated shores, terminated by ranges of lofty mountains, among which that of Ben Cruachan, rising to a height of 3,670 feet, at its northern extremity, is most conspicuous. A number of islets are scattered over its surface, and on two of them are some beautiful ruins.

Axayacatl, äx'a-yä-kät, or **Axayacatl**, a Mexican fly, the eggs of which, deposited abundantly on rushes and flags, are collected and sold as a species of *caviare*. The use of

these as an article of diet was learned by the Spanish settlers from their predecessors, the native Indian Mexicans, who called the dish *ahuauhti*.

Axayacatl, ä'cha-yä-kä't'l, a Mexican emperor: d. about 1477. He was the father of Montezuma, whom Cortez conquered, and reigned 14 years. He was already famous as a warrior when he became emperor of the Aztecs, and inaugurated his reign by a successful expedition against Tehauntepec, and in 1467, conquered anew the cities of Cotasta and Tochtepec. A little later he repelled the tribes who strove to get possession of the Mexican capital, and maintained a vigorous warfare against his neighbors. The palace of Axayacatl, a gigantic pile of stone buildings, became the barracks of the Spaniards. His treasures were discovered by Cortez, within a concealed door, and the chronicler of the conquest exclaims that "it seemed as if all the riches in the world were in that room." They consisted of gold and silver in bars and in the ore, many jewels of value, and numerous rich and beautiful articles of curious workmanship, as imitations of birds, insects, or flowers.

Axe (apparently an original Aryan word), a long-handled tool for wood-cutting. Its essential feature is the helve, though a certain shape is imposed by the nature of its service. The chipped flint of the oldest Stone Age was a tool of all work, to crush, dig, or cut (rather, bruise off), as occasion demanded, and was too heavy and shapeless to be used except by hand. As soon as one was shaped and sharpened to admit of tying a handle to it for a heavier stroke, the axe came into being, and was probably the earliest implement thus differentiated. So natural a device was separately invented by each race early in its history, and made of the material at hand: flint in England and America; whinstone or granite in Ireland, and by the lake dwellers of the Continent; bone by the American Indians and Eskimos; while stone axes are still used by some of the South Sea Islanders. In all these cases and until the use of metal, the handle was secured with a thong, as piercing with an eye was impracticable. The first copper and bronze "celts" were made in the same way. But when casting had become familiar, it was seen that there was no difficulty in casting a hole to thrust the handle in, making a much surer and heavier stroke; and with this "eye" the modern axe appeared. The bronze axe was lightened and better shaped, and in its turn displaced by iron, for which with the progress of invention has been substituted an iron butt-inset with a steel cutting part. The old hand forges have for some generations been replaced by immense establishments with developed machinery. The American process consists of cutting the butt from a piece of white-hot iron, punching the eye, then reheating and shaping it by pressure between concave dies; again heating, cutting in the edge a groove, into which the arched steel edge-piece is set, then welding the two and drawing out the axe to a proper edge by trip-hammers at a white heat. The next process is hammering off the implement by a combination of hand and machine work, and restoring the shape lost in drawing out. It is then ground to symmetry, hung on a revolving table in a furnace, and heated over a small

AXEL — AXOLOTL

coal fire, at a peculiar red heat, determined by the eye; cooled in brine and then in fresh water, and removed to another furnace, where it receives the last temper. It is next polished to a finish that shows every flaw, and enables it to resist rust and enter wood easily; then stamped, the head painted to prevent rust, weighed, labeled, and packed for sale. The leading axe establishment of the world is the Collins Company, of Collinsville, Conn., whose processes are largely special inventions for the company. It manufactures 5,000 axes and other edge tools daily, besides other miscellaneous goods; and consumes annually 3,500 tons of iron and 1,200 of steel, and 10,000 tons of coal. Nearly 700 men are employed; 13 water-wheels and four steam engines supply the motive power.

Ax'el, or **Absalon**, Danish prelate, archbishop of Lund: b near Soroe, Zealand, 1128; d. 1201. His family name was Axel. In 1157 he was chosen bishop of Roskilde or Røthchild. In that age warlike pursuits were not deemed inconsistent with the clerical office, and Absalon was a renowned warrior by sea and land, as well as a zealous ecclesiastic, his avowed principle being that "both swords, the spiritual and the temporal, were intrusted to the clergy." To his exertions as statesman and soldier Waldemar was largely indebted for the independence and consolidation of his kingdom.

Ax'elsen, a powerful Danish family who flourished in the latter half of the 15th century, and the members of which figured in the wars of Christian I. and John IV. of Denmark, and Karl Knutsen and Eric the Pomeranian, kings of Sweden. **PETER AXELSEN** was the head of the family. Of his nine sons, the eldest, **OLAF**, made himself master of Gothland; the second, **IVER**, retained that possession, and became a corsair; the third, **ERIC**, was governor of Stockholm; and the fourth **AAGE**, became a Danish counselor of state.

Axholme, an island in Lincolnshire, England, formed by the rivers Trent, Don, Idle, and Vicardyke. Epworth, the home of the Wesleys, is the principal parish. Its area is 47,000 acres. The soil is exceedingly fertile.

Ax'il, in botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow out from the stem in axils of leaves, and this position is naturally termed axillary. In anatomical terminology, the axilla is the armpit.

Axim, a-shēng', or äx'im, an important station and port on the African Gold Coast, near the mouth of the Ancobrah River. Inland from Axim, in the basin of that river, and in the district between it and the Prah, gold-mining operations have been carried on on a large scale. It was ceded to the English by the Dutch in 1872.

Ax'inite (Greek, "like an axe"), a mineral usually occurring in broad, acute-edged triclinic crystals, suggestive, in shape, of an axe. It has a glassy lustré, brown or yellow in color, and is translucent and strongly pleochroic. It has a hardness of 6.5 to 7, and a specific gravity of about 3.28. Its exact composition is still doubtful, but it may be described as a calcium and aluminum borosilicate, containing also varying amounts of manganese and iron. Its most

important occurrences are in Dauphiné, France, Mount Skopi, Switzerland, in Japan and at Franklin Furnace, N. J.

Axin'oman'cy, a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe poised upon a stake was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of axinoman'cy was by watching the movements of an agate placed upon a red-hot axe.

Ax'iom (an assumption), a universal proposition, which the understanding must perceive to be true as soon as it perceives the meaning of the words, though it cannot be proved. It is, therefore, called a self-evident truth. In mathematics, axioms are those propositions which are assumed without proof, as being in themselves independent of proof, and which are made the basis of all the subsequent reasoning. Euclid has assumed 15 axioms as the basis of geometry. Among these are "The whole is greater than its part"; "Things that are equal to the same thing are equal to one another"; "Magnitudes which coincide, that is, which exactly fill the same space, are equal to one another in every respect." Bacon calls axiom a general principle, obtained by experiment and observation, from which we may safely proceed to reason in all other instances; and Newton gives the name of axiom to the laws of motion, which, of course, are ascertained by the investigation of nature; he also terms axioms those general experimental truths or facts which form the groundwork of the science of optics.

Ax'is (in crystallography). See **CRYSTAL**.

Ax'is (Latin, of unknown origin), a white-spotted deer (*Axis axis*) of India and the East Indies, known locally among the Hindus as "chitra," among the English as the "hog-deer." It resembles the European fallow deer in size and color, and as it is easily domesticated, is a favorite in European parks. The slender, sharp-pointed horns are not palmated and only a little branched, while the female is hornless. It is timid and usually goes in small herds, in which females largely predominate. It lives in thick jungles near water, and usually feeds in the night. Colored plates, illustrating its varieties, are given in Lydekker's 'Deer of All Lands' (1898).

Ax'minster, a market town in Devonshire, England, 24 miles east of Exeter, on the side of a hill that rises above the River Axe. The only public building worthy of notice is the parish church, a very ancient edifice, containing some interesting antique monuments. Axminster was at one time celebrated for its woolen cloth, and carpet manufactures, and gave name to a special make of carpet having a thick, soft pile. Brushes are now made here, and there are flour and other mills. Pop. (1901) 4,100.

Axolotl, äx'ô-löfl (Mex., "play in the water"), a larval salamander regarded as edible. They are numerous in the lakes about the City of Mexico, are 6 to 10 inches long, and are prepared by either roasting or boiling, and eaten with vinegar or cayenne pepper. The

most extraordinary thing about them, however, is the fact that they are the young of a species of terrestrial salamander (*Amblystoma tigrinum*), well known over all the warmer parts of the United States and Mexico, which in these lakes never transform into adults, but remain permanently in the larval condition, yet become sexually mature when about six months old, so that they are able to breed. This astonishing fact was long unknown. The axolotl has bushy, external gills similar to those which permanently characterize the mud-puppy. It was regarded as a distinct animal, and named *Siredon lichenoides*. The discovery of the truth was made accidentally in Paris in 1865, when some axolotls in an aquarium in the Jardin des Plantes lost their gills and were transformed into perfected amblystomas. A lady, studying in the University of Freiburg, Fräulein Marie von Chauvin, then undertook a series of careful experiments with other captives, and worked out the complete history of metamorphosis, which is dependent (at least in Europe) on a very narrow set of favorable circumstances, but differs in no essential degree from that of other salamanders (q.v.). Why the change never takes place in the Mexican lakes is unexplained. The theories in regard to it, and the detailed history of the observations above mentioned, are given by Gadow in 'Amphibia and Reptiles' (1901), with many references to other books and periodicals.

Axon, that part of the nerve cell that carries the nervous impulses, the axis cylinder process, or the nerve fibre proper. See NERVE CELL; NERVE FIBRE.

Axum, *ax-oom'*, a town in Abyssinia, once the capital of a powerful kingdom, and at one time the great depot of the ivory trade in the Red Sea. The importance of this city and its kings was first made known to us by a stone (*Axumitic marble*) with a Greek inscription, first explained by Salt, who discovered it, and afterward by Buttmann and Niebuhr. The interest in this inscription was increased by the explanation which it afforded of the second half of the Adulian marble. Axum, the place where it was found, still exhibits many remains of its former greatness. Among its ruins are shown the royal throne, and groups of obelisks, originally 55 in number, one of which Salt declared to be the most beautiful that he had seen. Pop. 5,000. See Bent, 'The Sacred City of the Ethiopians' (1893).

Ayacuchco, *ä'ya-koo'chō*, the name of a department of Peru and also of its capital. The department has an area of about 24,000 square miles, and is traversed by both chains of the Cordilleras and watered by numerous rivers. It produces coffee, sugar, cotton, etc. The capital, situated on the main road from Lima to Cuzco, has a cathedral and a university. It was founded by Pizarro in 1539, and long known as Huamanga. A battle took place here, one of the most celebrated in the history of South America, having been decisive of the independence of upper and lower Peru. See AYACUCHO, BATTLE OF. Pop. of town 22,000.

Ayacuchco, *ä'ya-koo'chō*, **The Battle of**, a decisive engagement in the South American struggle for liberty; was fought on 9 Dec. 1824, at and near the Peruvian town of that name. On the one side was the Spanish viceroy of

Peru with nearly all that remained of the Spanish power in its last stronghold upon the continent; on the other Gen. Sucre, second in command to Bolívar (the latter not being present), with Colombian troops, and Peruvians led by Gen. Lamar. The viceroy was taken prisoner; the utter defeat of his army made possible the independence of Bolivia (realized the following year), and strengthened the republican governments in all the neighboring states.

Ayala, *a-yà'la*, **Adelardo Lopez de**, a Spanish dramatist. b. Gaudalcanal, Badajoz, March 1820; d. 30 Dec. 1879. After studying law in Seville, he went to Madrid, where he devoted himself entirely to poetry and speedily won national fame. His first drama, 'A Statesman' (1851), met with immediate success, and was followed in the same year by 'The Two Noblemen' and 'Penalty and Pardon'. To the modern comedy of manners, his specific domain, he first contributed 'The Glass Roof,' and in 1861 attained to wide reputation with 'Percentage.' Of his other works the most noteworthy are 'The Modern Don Juan' (1863); and 'Consuelo' (1878), a drama.

Ayala, *Lopez de*, Spanish historian and poet. b. 1332; d. 1407. He was a prominent statesman and warrior during the reigns of the Castilian kings Pedro the Cruel, Henry II, John I, and Henry III, and is known as the author of a 'Chronicle of the Kings of Castille' (his contemporaries), in which the crimes of Pedro the Cruel are detailed and drawn in colors said to be sometimes overcharged.

Ayamonte, *a'ya-mōn'tā*, a seaport town in Spain, near the mouth of the Guadiana, which here forms the boundary between Spain and Portugal.

Aycock, **Charles Brantley**, American politician. b. Mahunta, now Fremont, Wayne County, N. C., 1 Nov. 1859. He was educated at the University of North Carolina, studied law and began the practice of his profession at Goldsboro, N. C. in 1881. In 1893 he was appointed United States district attorney for the eastern district, and in 1900 was elected governor of North Carolina by a majority which was the largest ever given to a gubernatorial candidate in that State.

Aye-Aye, *äi'äi'* (native Malagasy name; from its cry), a lemur (*Daubentonia madagascarensis*), about the size of a rabbit, and with teeth like a bat. It is small and brownish, with a long bushy tail. Arboreal and nocturnal in habit, it lives in bamboo jungles feeding on vegetables and the larvae of certain borers. Its feet, as well as its hands, have opposable thumbs, and exceedingly long, naked, flexible-fingers armed with pointed nails, suitable for extracting grubs out of deep crevices.

Ayeen, *ä-yēn'*, or **Akbery**, a valuable statistical description of the Mogul empire as it was in the reign of Akbar. It was compiled by Abul Fazi, the vizier of the Emperor Akbar. There is an English translation of it by Gladwin.

Ayesha, *a-yē'shā*, the daughter of Abubekr, the favorite wife of Mohammed: b. 610 or 611; d. 677 or 678. After Mohammed's death she opposed the succession of Ali, raised an army against him, and was taken prisoner, but dismissed with that spirit of chivalry which had already arisen among the Arabians.

AYLESBURY — AYR

Aylesbury, ălz'bēr-ī, a market town in Buckinghamshire, England, 38 miles northwest of London, in the centre of the fertile valley of Aylesbury. There are many old houses, irregularly but picturesquely built. The parish church of St. Mary is a fine early English edifice, and there are various other places of worship; a county-hall, market-house, clock tower, and corn exchange. There are also baths, a large county hospital, and the only convict prison for women in England. The chief industries are printing, making condensed milk, and poultry-raising for the London market, Aylesbury ducks being widely known, and there are several breweries and flour-mills. Pop. (1901) 9,244

Aylesbury Duck. See DUCKS.

Aylesford, ălz'ferd, a town in Kent, England, three miles from Maidstone. In its vicinity is the remarkable monument called Kit's Coty House, a kind of Druidical cromlech.

Ayllon, i-lŷon, **Lucas Vasquez de**, Spanish adventurer: b. about 1475; d. 1526, who, in 1509, occupied the position of counsel at the supreme court of St. Domingo, and was subsequently employed by Fernando Cortes, on a mission to Velasquez. In 1520, he joined an expedition to Florida, treacherously captured a great number of natives, and proposed to found a new colony, but was unsuccessful, and is supposed to have lost his life while engaged in a second expedition to Florida.

Aylmer, ăl'mēr, **John**, English prelate: b. Norfolk 1521; d. 1594. He was tutor to Lady Jane Grey. On the accession of Mary, he was forced to leave his country, but when Queen Elizabeth came to the throne he returned to England; and in 1576 was made bishop of London.

Ayl'mer, Matthew, Canadian military officer: b. Melbourne, P. Q., 28 March 1842. He entered the British army in 1864; retired from the imperial service and entered the Canadian volunteer militia in 1870; and became adjutant-general of the Dominion militia, the highest military office in Canada next to that of the major-general commanding, in 1896.

Ayl'mer-Gowing, Emilia, English poet and reciter: b. Bath, October 1846. She was educated partly in Brighton, partly in Paris, where she received the attention of Lamartine. After a short career on the stage she successfully produced two dramas, 'A Life Race,' and 'A Crown for Love.' Her 'Ballads and Poems,' and 'The Cithern' have become popular, as well as two novels, 'The Jewel Reputation,' and 'An Unruly Spirit.' In 1891 she published 'Ballads of the Tower and Other Poems.'

Ayl'mer, Lake. (1) A Canadian lake, lying 80 miles north of Great Slave Lake on the margin of the forest area. (2) A Canadian lake in Quebec, about 70 miles south of the city of Quebec.

Ayl'offe, ă'lōf, **Sir Joseph**, an English antiquary: b. about 1708; d. 1781. He was one of the first council of the Society of Antiquaries, a commissioner for the preservation of state papers, and author and editor of several works, of which the best known is his 'Calendars of the Auntient Charters,' etc.

Aymaras, i'mā-răz', an Indian race of Bolivia and Peru, speaking a language akin to the Quichua. They are physically characterized by great chest development, caused by the rarefied air of the region they inhabit.

Aymon, ă'môn, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud, sons of Aymon or Haimon, Count of Oordogne, who figure among the most illustrious heroes of the chivalric poetry of the Middle Ages; but their historic existence must be considered problematical. Their career furnished rich material to the romantic narratives of Italy in the 15th and 16th centuries. A novel, entitled 'The Four Aymon Brothers,' by Huon de Villeneuve, a French poet of the age of Philip Augustus, details very minutely their exploits, and Ariosto conferred a poetical immortality on the family by the publication of his 'Roland,' in which Renaud, the bravest of the four brothers, plays continually the most distinguished part.

Ay'oubites, or **Ayyubites**, the Saracenic dynasty founded by Saladin, which in Egypt supplanted the Fatimite caliphs, about 1171 A.D. Several of the descendants of Saladin, known as Ayoubites, afterward ruled in Egypt, Syria, Armenia, and Arabia Felix. In the 13th century their power was destroyed by the Mamelukes.

Ayr, ăr, a town in Scotland, on the river Ayr, and 34 miles south-southwest of Glasgow. The principal streets of modern Ayr are spacious and well paved, and many of the buildings handsome. The most important edifices are several churches of the various denominations, the town-hall and connected offices, in great part completed in 1881, surmounted by a fine spire of older date, 226 feet high; the county buildings; the academy, a celebrated educational institute, the buildings of which are handsome and commodious; the Wallace tower, 115 feet high on the site of a more ancient tower; the free library; the railway station and hotel; a hospital; etc. There is a handsome esplanade along the sea front 1,500 yards long. Two bridges connect Ayr with Newton and Wallacetown, incorporated in the burgh. One of these, opened in 1879, occupies the place of the "New Brig" of Burns' 'Brigs of Ayr,' the "Auld Brig" (built 1252) being still serviceable for foot traffic. There is now also a third bridge farther up the river, besides the railway bridge. Ayr exports manufactured goods, iron, coal, whetstones, etc.; and imports iron-ore, grain, timber, slates, bricks, etc. The harbor lies within the mouth of the river, and is enclosed and protected by a north and a south pier and a breakwater; there being also a wet dock and a slip dock. Shipbuilding is carried on, also tanning, boot and shoe making, the manufacture of carpets, lace curtains, etc. The poet Burns, as is well known, was born in a house which stands within one and one half miles of the town, between it and the church of Alloway ("Alloway's auld haunted kirk"), and a monument has been erected to his memory on a height between the church and the bridge over the Doon. Pop. (1901) 28,624.

Ayr, a river of Ayrshire, Scotland, which after a course westward of 18 miles, finally loses itself in the Frith of Clyde below the town of Ayr.

AYRER—AYUNTAMIENTO

Ayrer, i'rer, Jacob, German dramatist: b. Nuremberg about 1560; d. there, 26 March 1605. Between 1595 and 1605 he wrote more than 100 plays, of which the 'Opus Theatricum' (Nuremberg 1618) contains 30 tragedies and comedies, and 36 Shrovetide plays and vaudevilles. In his dramas the influence of the English stage is apparent.

Ayres, ārz, Alfred. See OSMUN, THOMAS ERMBLEY.

Ayres, Anne, American author: b. England, 1816; d. February 1896. She was the first member of an American sisterhood in the Protestant Episcopal Church. She wrote 'Evangelical Sisterhood' (1867); and 'Life of Augustus Muhlenberg.'

Ayres, Romeyn Beck, American soldier: b. East Creek, N. Y., 20 Dec. 1825; d. New York 4 Dec. 1888. He served in the Federal army during the Civil War, and at its close was brevetted brigadier-general and major-general in the volunteer and regular service.

Ayr'shire, an extensive maritime county of Scotland, about 60 miles in length, with a breadth varying from 10 to 26 miles. Its coast line is about 75 miles in length, has several excellent harbors. The singular rock off the coast, known by the name of Ailsa Craig, belongs to the county, as also do one or two other islets. The surface has no great elevations, the highest summits varying from about 1,200 to 1,900 feet. The principal streams are the Ayr, Stinchar, Girvan, Doon, Irvine, and Garnock.

The mineral riches are very considerable. Coal is abundant, especially in the middle and northern parts of the county, and there are over 100 collieries. Extensive seams also of black-band ironstone exist, and are now being actively worked. Ayrshire having become the great seat of the iron manufactures of Scotland next to Lanarkshire. Plumbago is found in some localities; and lead, antimony, and copper are also met with. Limestone and freestone abound. Millstones, of coarse granite, much esteemed for their hardness and durability, are quarried near the north coast, in the district of Cunninghamham.

The native sheep are bred in great numbers; their wool is coarse and scanty, but the flesh is excellent. The horses of Ayrshire are of superior breed, being hardy, strong, and of large size. The woollen manufactures are extensive, particularly carpets, bonnets, and worsted shawls, which are produced in great quantities. On the coast is the ancient castle of Turnberry, in which Robert Bruce, king of Scotland, is said to have been born, and where he is known to have spent many of his youthful years. It was here that a fire, accidentally kindled, was mistaken by Bruce for an appointed signal, and caused him to cross the sea from the island of Arran opposite to attempt the deliverance of his country. Of the ecclesiastical ruins the most interesting is the abbey of Crossraguel, founded in 1244. The chief towns are Ayr, Kilmarnock, Irvine, Troon, Saltcoats, Largs, and Ardrossan. Pop. (1901) 254,436.

Ayrton, ār-tōn, William Edward, English electrician and inventor: b. London 1847. He entered the Indian telegraph service, having studied electrical engineering with Prof. William Thomson; became electrical superintendent and introduced throughout India the system of de-

termining the position of a fault by electrically testing one end of a line. In 1873-9 he was professor of natural philosophy and telegraphy at the Imperial College of Engineering in Japan; in 1879 became professor of applied physics in London Technical College, and, in 1884, chief professor of physics at the Central Institute, South Kensington. He was elected president of the Institute of Electrical Engineering in 1892. With Prof. Perry, he invented the ammeter, voltmeter, electric power meter, ohmmeter, and dispersion-photometer; and, with Profs. Jenkin and Perry, the system of telerphage. He has been a voluminous writer and is widely known for his 'Practical Electricity.'

Aytoun, ā'toon, Sir Robert, Scottish poet: b. 1570; d. London, March 1630, and studied at St. Andrews. He addressed an elegant panegyric in Latin verse to King James on his accession to the crown of England, which had, no doubt, some influence in securing to the author the favor of that monarch. He was at a later period of his life honored with the appointment of secretary to Henrietta Maria, queen of Charles I. During his residence abroad, as well as at the court of England, he lived in intimacy with, and secured the esteem of, the most eminent persons of his time. The poems of Sir Robert Aytoun, for the first time published together in the Miscellany of the Bannatyne Club, are few in number, but are distinguished by their elegance of diction. Several of his Latin poems are preserved in the work called 'Delitizæ Poetarum Scotorum' (1637).

Ay'toun, William Edmondstoun, Scottish poet and prose writer: b. Edinburgh, 1813, d. Blackhills, Elgin, 4 Aug. 1865. He studied at the University of Edinburgh, and passed as advocate in 1840. His first independent work was the 'Life and Times of Richard I' (1840). In 1848 he published a collection of ballads entitled 'Lays of the Scottish Cavaliers,' which has continued to be the most popular of all his works, and has passed through numerous editions. It was followed in 1854 by 'Firmilian, a Spasmodic Tragedy'; in 1856 by the poem of 'Bothwell'; and in subsequent years by the novel called 'Norman Sinclair,' and various other original works. In 1858 he issued a critical and annotated edition of the 'Ballads of Scotland.' The translation of the poems and ballads of Goethe which he undertook in conjunction with Theodore Martin was less successful than some of his other works. In 1845 he was appointed professor of rhetoric and English literature in the University of Edinburgh—a position which he held till his death. In 1854 he became editor of 'Blackwood's Magazine.'

Ayuntamiento, a-yoon'ta-myān'tō, the name given in Spain to municipal councils. Firmly established during the struggles with the Moors, the ayuntamientos acquired great influence and political power, the nobility being admitted to them without their class privileges. The Cortes, in 1812, adopted the leading features of the former system. On the return of Ferdinand VII., the ayuntamientos were abolished, but restored in 1837. The ayuntamientos were empowered to make up the lists of electors and jurors, to organize the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and

AZALEA — AZIMUTH

to manage the funds of the commune. The municipal law of 1870 deprived them of all political authority, and regulated them as administrative bodies, subject in certain respects to the authorities of the provinces, the law courts, and the Cortes.

Aza'lea, a genus of about 25 species of shrubs of the natural order *Ericaceæ*, natives of the northern hemisphere, principally of eastern Asia and North America. By some botanists the genus is united with *rhododendron* (q.v.), as may be seen below. The species have deciduous or evergreen leaves and showy, often fragrant flowers, usually in terminal umbel-like racemes. They are commonly divided into two groups: the Indian azaleas and the hardy deciduous azaleas, including the Ghent hybrid forms. The Indian azaleas, mostly imported from Holland and forced in greenhouses, are propagated by grafts or cuttings, rarely by seeds. They are planted in loose, moderately fertile soil; sheltered from the sun and watered freely during the summer; repotted in early autumn; and, by special attention, brought into flower as desired from late autumn until early summer. The leading species of the group is *A. indica* (*R. indicum*), of which two varieties, *amara* and *kamoferi* are fairly hardy as far north as New Jersey. The members of the hardy group need some protection in the north and in exposed situations to prevent injury to the flower-buds due to sudden variations of temperature. Named varieties are usually propagated by grafts or by cuttings. Seedlings are often grown for their own merits, but are generally used for stocks upon which to graft choicer varieties. The following are among the best known species of this group: *A. vaseyi* (*R. vaseyi*), an excellent North Carolina species with spotted flowers which appear in early May; *A. nudiflora* (*R. nudiflorum*) pinxter-flower, found from Canada to the Gulf of Mexico, has pink, white, or sometimes purple flowers in mid-spring; *A. calendulacea* (*R. calendulaceum*), found from Pennsylvania to Georgia, has large orange- or flame-colored, particularly handsome blossoms in late spring; *A. occidentalis* (*R. occidentale*), a California species, bears fragrant, white, pinkish flowers in early summer; *A. arborescens* (*R. arborescens*), found in the Alleghany Mountains, has fragrant white or pink flowers in June; *A. viscosa* (*R. viscosum*), clammy azalea or white swamp honeysuckle, is found in swamps from maritime Canada to Florida and westward to Arkansas, and bears fragrant white or pink flowers in June or July. Among the Asiatic members of this group the best known are probably: *A. mollis* (*R. molle*); *A. rhombica* (*R. rhombicum*); and *A. pontica* (*R. ponticum*). Consult: Halliday, 'Treatise on the Propagation and Cultivation of Azalea Indica'; Van Geert, 'Iconographie des Azalées'; Bailey and Miller, 'Cyclopedia of American Horticulture.'

Azari'as, Brother (PATRICK FRANCIS MULLANY), b. 29 June 1847, near Killenaule, County of Tipperary, Ireland; d. 20 Aug. 1893, Plattsburgh, N. Y. (Cliff Haven). His father emigrated to the United States in 1851, leaving Patrick, his eldest son, in Ireland a few years on account of his health. Deerfield, N. Y., a place near Utica, was the new home, where he at-

tended the public school and later the Christian Brothers' academy in Utica. At the early age of fourteen he decided to become a Brother, and on June 29, 1862, Patrick Francis Mullany received the black habit and white collar of a Christian Brother, and henceforth became known to the world as Brother Azarias. At the age of seventeen he was put in charge of a large class; and at the age of nineteen he was professor of mathematics in Rock Hill College, near Baltimore, Md. Ten years later, he was made head of the college. His first book, 'An Essay Contributing to a Philosophy of Literature' (1874), won him the respect of scholars. His philosophical articles on literature, published in various magazines, were well received, and he was soon in demand as a lecturer before educational bodies, Catholic and non-Catholic. When in the 80's he went to Europe, he found friends everywhere; scholars who had read his books, men like Cardinal Newman greeted him as a friend. He was a promoter of the Catholic Summer School of America, and of several other educational movements. After finishing his course of lectures at the Catholic Summer School at Cliff Haven, 1893, he was too ill to go home or to any of the other meetings where he was expected. His last days were spent in 'Blue Point Hotel,' near the Summer School grounds. His published works are: 'Aristotle and the Christian Church'; 'Books and Readings'; 'Culture of Spiritual Sense'; 'Development of English Literature'; 'Development of Old English Thought'; 'Essays Educational'; 'Essays Miscellaneous'; 'Essays Philosophical'; 'Mary, Queen of May'; 'Mary, Queen of May and Essays'; 'Phases of Thought and Criticism'; 'Philosophy of Literature'; 'Psychological Aspects of Education.'

Azeglio, ad-zá'lyō, **Massimo Taparelli, Marquis d'**, Italian author, artist, diplomatist, and statesman. b. Turin, 1801; d. 16 Jan. 1866. In 1816 he accompanied his father to Rome, and there occupied his time principally with painting and music. He was already favorably known as a painter, when, in 1830, he went to Milan, married the daughter of Manzoni, the great novelist, and wrote several romances. The earliest of these, 'Ettore Fieramosca,' was received with great enthusiasm. His next romance, 'Niccolò de Lapi,' became equally popular, and is esteemed by Italian critics the best historical novel in any language. Deeply imbued with the spirit of Italian nationality, in 1842 Azeglio made a tour through the provinces of Italy, awakening the revolutionary spirit which troubled the last years of Gregory XVI. After the revolution of 1848 he supported the cause of the king of Piedmont, and, at the head of the papal troops, fought against the Austrians at Vicenza, where he was wounded. In 1849 Victor Emmanuel appointed him president of the cabinet of ministers, an office which he resigned in 1852 to his political adversary, Count Cavour. In 1859, after the peace of Villafranca, he undertook a confidential mission as ambassador extraordinary to England; and was afterward appointed governor of the city of Milan.

Az'imuth, in astronomy, the arc of the horizon comprehended between the meridian of the observer and the vertical circle passing through the star. It is easterly if the star is

AZOBENZENE — AZOV

observed before, westerly if after, and zero if at the time of culmination. It is usual to connect with the quadrant a graduated, horizontal circle, called the *azimuth circle*.

Azio, Greece, a village on the gulf of Arta, in the district and promontory of the same name. A German archæologist, Dr. Erlinger, succeeded, in 1857, after several years' investigation, in ascertaining the position of the camps of Antony and Augustus, precisely as it was on the eve of the battle of Actium. He found the camp of the latter surrounded by a cincture of redoubts about $5\frac{1}{2}$ miles in extent, which were constructed in stone, and protected by a ditch. In advance of the camp were external works, consisting of several small forts of observation, one of them serving as a telegraph for communicating with the fleet. In the ruins of one of these forts was discovered a tablet in steel, on which signals are traced, resembling somewhat those of the aerial telegraphs.

Azkar Tuarik, an African tribe of the Tuariks, who inhabit the desert country between Ghat on the north and the tracts of the Kelowi Tuariks on the south, between lat 21° and 26° N. They were first visited and made known to the European world by the British central African expedition of Barth, Overweg, and Richardson. The country in the north is a barren plain, with scarcely any vegetation, and with isolated granite peaks, and few or no animals. The southern portion, bordering on the Kelowi Tuariks, is the uninhabited central region of the great desert. The inhabitants of Azkar, like the rest of the Tuariks, belong to the Berber and not to the negro race. They are fanatical Mohammedans in religion, hating both Pagan and Christian. They are monogamists. They are a warlike aristocracy, divided into 5 *tyusi*, or clans, and subdivided into 30 divisions or *fayas*, each of which has a separate chief.

Azmari, the name applied to a set of vagrant beggars in Abyssinia, part of whom form the music bands of the Abyssinian army, while the rest exercise their musical voices in the street, especially on religious holidays.

Azo, or **Azzo**, or **Azzolinus**, **Portius**, an Italian lawyer, d. in 1200. He professed jurisprudence at Bologna with such éclat that the college could not contain all his auditors, so that he had to take to the public square.

Azoben'zene. See **BENZENE**.

Az'o Colors. See **COAL TAR COLORS**.

Azo'ic, the name given to the earliest geological period, before the appearance of life on the earth. It includes the oldest rocks, mostly granites, gneisses, and schists, in which there are no traces of organic remains. The term is practically synonymous with *Archæan*.

Azores, or **Western Islands**, a Portuguese archipelago, in the mid-Atlantic, between lat $36^{\circ} 55'$ and $39^{\circ} 55'$ N. and between lon $25^{\circ} 10'$ and $31^{\circ} 16'$ W. Stretching over a distance of 400 miles, their nine islands are divided into three distinct groups—Sta Maria and São Miguel in the southeast; Terceira, São Jorge, Pico, Graciosa, and Fayal in the middle; and Flores and Corvo in the northwest. Of these, Flores lies 1,176 miles west of Cape Rocca in Portugal, 1,484 miles southwest of Falmouth, and 1,708 miles east-southeast of Halifax. In 1431–53 the Azores were taken possession of by the Portuguese. They were at that time unin-

habited; but that they had been visited by the Carthaginians is proved by Punic coins found on Corvo. They seem to have been known to the Arabian geographer Edrisi in the 12th century; and they are marked distinctly on a map of 1351. The Portuguese colonists called the whole group Azores, from *azor* or *azor*, a hawk; and they named two individual islands, Corvo and São Jorge, from Corvi Marini and San Zorze, which, according to a map of 1375, had been previously seen in the western ocean. In 1466 Alfonso V. made a life grant of the island of Fayal to his aunt, the duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders.

The total area of the group is 919 square miles, and the population (1890) 255,594. The area, population, and the maximum altitude of the different islands are as follows: Sta Maria (38 square miles; 5,880; 1,889 feet); São Miguel (299 square miles; 107,000; 3,854 feet); Terceira (164 square miles; 45,391; 3,435 feet); Graciosa (24 square miles; 8,718); São Jorge (91 square miles; 18,000); Pico (173 square miles; 27,904; 7,613 feet); Fayal (69 square miles; 26,264); Flores (54 square miles; 10,700; 3,087 feet); Corvo (7 square miles; 1,000). The capital is Angra, in Terceira; but Ponta Delgada, in São Miguel, is a larger town. The Azores are of volcanic origin, and with the exception of Corvo, Flores, and Graciosa, are still liable to eruptions and violent earthquakes, the worst of 21 shocks since 1444 having been those of 1591, 1638, 1719, and 1841. Hot mineral springs are numerous; and the baths of Furnas, in São Miguel, are much resorted to by invalids. The coast is generally steep and rugged; the interior abounds in ravines and mountains. Perhaps the greatest want of the group is a good harbor. The Azores are regarded as a province, not a colony, of Portugal, and as belonging to Europe.

Az'ote, a name formerly given to nitrogen; hence substances containing nitrogen and forming a part of the structure of plants and animals are known as azotized bodies. Such are albumen, fibrine, casein, gelatine, urea, kreatine, etc.

Az'otine, a substance procured by decomposing wool by the action of steam at 150° C. under a pressure of five atmospheres; the product, afterward dried by evaporation, contains nitrogen completely soluble in water. Azotine is mixed with dried blood for a fertilizer.

Azov, a-zōf', a town in the south of Russia, on the Don, seven miles from its mouth. The sand and mud deposited by the river have choked up the port, so that its trade and shipping have dwindled away, and the inhabitants depend mostly on fish-curing. Azov was built nine miles from the site of the ancient Greek colony of Tanais; and when, in the 13th century, it was taken possession of by the Genoese, they altered its name to Tana. They were driven out of it by Timur (Tamerlane) in 1392. In 1471 it was taken by the Turks, and in 1696 by Peter the Great; and it was finally ceded to Russia in 1774. Pop. (1897) 27,500.

Azov', Sea of (ancient *Palus Mæotis*), an arm of the Black Sea, with which it is united by the Straits of Kertch. Its length, southwest to northeast, is about 168, its breadth about

AZPEITIA — AZTEC CONFEDERACY

80 miles; greatest depth, near its north side, not more than 8 fathoms. The western part, called the Putrid Sea, bordering on the Crimea, is separated from the main expanse by a long sandy belt, called Arabat, along which a military road has been formed. The sea teems with fish. Of the islands it contains, Benesch, the largest, has an area of 65 square miles.

Azpeitia, ath-pā'e-tya, a town in Spain, 18 miles southwest of San Sebastian. A mile from it is the famous convent of Loyola, now converted into a museum and built by the Roman architect, Fontana, in 1683. It includes the tower of the Santa Casa, in which St. Ignatius of Loyola, the founder of the Society of Jesus, was born in 1491. Here every year in July a great festival is held in his honor, to which pilgrims flock from all quarters. Pop. about 7,000.

Azrael, āz'rā-ēl, in Mohammedan mythology, the angel of death.

Az'rek, the principal stream of Abyssinia, which, after a winding course through Abyssinia and Sennaar, falls into the Nile above Gerra.

Az'tec Club, an organization formed to preserve the memories of the war in Mexico, established in Mexico in 1847.

Az'tec Confederacy. The name Aztecs (properly Aztecas) is currently used for all the Nahuatl (q.v.) tribes in Mexico at the time of the Spanish conquest. It belongs at most only to the seven more closely cognate tribes which occupied the valley of Mexico, and is by some restricted to the one tribe which built Tenochtitlan, or Mexico City, and is so used for convenience here. The name is from the unidentified place (generally assumed as northward) whence they came, Aztlan, variously interpreted as "heron place," "heron-clan place," "white place," and "seacoast"; the best opinion makes it Jalisco or Michoacan, on the west coast of Mexico. Apparently some time from the 9th to the 11th century they invaded the plateau of Anahuac ("waterside," lake district), where tribes of the same stock were already living, and took possession of several commanding points; the chief pueblo being that of the Aztecs or Toltecs at Tollan (now Tula), some 40 miles north of Mexico City, a leading pass from the north into the valley of Mexico. Driven from this by the warfare of the other natives the Aztecs moved south into the valley, and established themselves in the salt marshes where the outlet of lakes Chalco and Xochimilco flows into Lake Tezcuco, amid which in 1325 (the first absolutely sure date in their history) they built Tenochtitlan, now the city of Mexico. They converted it by dikes and causeways into an island, and gradually made it another Venice, a stone town intersected with canals, the strongest position in Mexico. For more than a century, however, they were tributary to the great pueblo of Azcaputzalco, near them on the western shore of the lake. Gradually they formed a stable military organization and more stable civil society; in 1375 they elected their first "chief of men," war chief and priest in one—Acamapichtli, often styled in books "the founder of the Mexican empire"; and under the fourth chief, Izcoatzin, allied themselves with Tezcuco on the eastern lake

shore. The two destroyed Azcaputzalco about 1430 and deported the surviving inhabitants to Tlacopan, near Mexico, which was made tributary to the latter. Tenochtitlan, Tezcuco, and Tlacopan then formed a league (the Aztec Confederacy, formerly termed the "Aztec empire"), purely for plunder and tribute, not at all for government or incorporation. The tribute was not only of food and similar supplies, a certain amount of land being cultivated for the benefit of the confederacy, but what was still more coveted, human victims for their gods, to be afterward eaten by themselves; sometimes of warriors for raids on others. The spoil was divided into five parts, Tenochtitlan and Tezcuco each taking two and Tlacopan one. In its less than a century of life, this league made some 30 pueblo towns tributary, principally to the east toward the gulf and south-east toward the Isthmus of Tehuantepec—a range of 8,000 or 10,000 square miles out of the 750,000 in the present Mexico. Even this was in no sense a military occupation of the country, much less the foundation of a state. Within a few dozen miles were great independent pueblos such as Cholula and Tlascala, the latter a strong and warlike settlement of some 30,000 people, who waged war to the knife with the Aztec confederacy, defeated their plundering assaults again and again, and aided other pueblos in resistance. Montezuma (q.v.), who acceded 1502, was heavily defeated by them and by the towns in Michoacan, but won success on the gulf coast; and when the Spaniards came, the southern Mexican peninsula was a mass of seething savage hatreds and feuds, no two tribes of the natives having any community of feeling or interest that could prompt them to unite with one another rather than with the foreigner. See CORTES; MEXICO; MONTEZUMA.

The Aztec tribe was divided into 20 clans or *calpulis*, each clan occupying several contiguous communal houses, each of which held several hundred persons; besides a clan office building where assemblies were held and strangers entertained. It was governed by an elected council, with a civil and a military head as in Rome, the latter being also constable. Each clan had its special rites, priests, and temple. It was divided into four phratries, each having among other duties that of exacting compensation for murders, and each ward had its own precinct, constituting four wards or quarters of the town, its arsenal, and its captain. These captains were called "darthouse-man," "man-slasher," "bloodshedder," and "chief of the eagle and cactus," the latter being chief executioner, and not eligible for the chieftainship of the tribe. The supreme government of the Aztecs was by a council of 20, one from each clan, who must not be a sachem, but a member of the clan council; he was called the "speaker," and the tribal council the "speech-place" (parliament, literally). It met every 10 days at least, and oftener if called together. Once in 80 days there was a special session attended by all the leading clan and phratry officials and priests, to reconsider unpopular decisions. The tribe, too, had a dual executive, civil and religious: a sachem who was civil magistrate and chief judge; and a war chief called "chief of men," and also some priestly functions, though there was a high priest also.

AZTEC TREASURE-HOUSE — AZZUBEYDI

He was originally chief only of the Aztecs; but about 1430 (probably on occasion of the destruction of Azcapotzalco), was made chief of the confederate army. He was elected by the tribal council and the clan war chiefs and leading priests, and could be deposed by them. His official residence was in the tribal office. From the time of the first chief, Acamapichtli, the office remained in a single family, like the old Aryan kingship.

The social and religious organization was a peculiar mixture of the lowest barbarism and the beginnings of civilization. There was no private property in land or dwellings; each man could keep a garden plot for his use, but it was his no longer than he used it. Family life had emerged from savage promiscuity: descent was reckoned in the male line, marital infidelity was punished, and remaining unmarried was not permitted except by special dispensation,—contumacy being punished by being made an outcast, a serf if a man and a prostitute if a woman. Slavery had thus begun in a small way; but the habitual use of prisoners of war as slaves had not, it being preferable to sacrifice and eat them. Agriculture was still primitive; but irrigation was practised to some extent, and horticulture was beginning to develop. The roads were only narrow trails; but they facilitated collection of tribute, and served military and trading purposes as well. The houses were generally of adobe brick, but many of the great pueblos were of stone, so that the towns looked like castellated cities. There were tessellated marble floors, finely worked and colored tapestries, and beautiful feather-work, vases, goblets, and censers of fine marbles and precious metals exquisitely wrought. There were regular weekly markets, which, though trade was by barter, indicated a large development of personal property and of superfluity above subsistence. There were elaborate pleasure-grounds, menageries, and aviaries, baths and fountains, and pleasure performances of dramas and singers, acrobats and jugglers. Yet the people were cannibals, and their religion was of the most hideous character, albeit with regularly organized priesthood and temples and altars. On one side the society touched the South Sea Islands, on the other it almost rose to ancient Egypt and was above Homeric Greece.

Aztec Treasure-House, The, a romance by Thomas A Janvier. It purports to be a narration of the thrilling adventures of a certain Prof. Thomas Palgrave, Ph.D.; an archaeologist who goes to Mexico to discover, if possible, remains of the early Aztec civilization.

Azuay, ā-thoo-ī', a province of Ecuador, with an area of about 11,150 square miles. The cinchona tree is found here in abundance. Pop. (1890) 132,400.

Azulai, a'zoo-li, **Hayim David**, 18th century Jewish bibliographer: b. Jerusalem. His life was mainly spent at Leghorn. Of his numerous works, the best known is 'Shem-ha-Gedolim' (the names of the great), a bibliography containing the names of over 1,300 Jewish authors and more than 2,200 of their works.

Azuni, ad-zoo'ne, **Domenico Alberto**, Italian jurist: b. Sassari, Sardinia, 1749; d. 23 Jan. 1827. He became judge of the tribunal

of commerce at Nice, and in 1795 published a work in which he endeavored to reduce maritime laws to fixed principles, and which appeared in French in 1805, under the title of 'Droit Maritime de l'Europe.' Napoleon appointed him one of the commissioners for compiling the new commercial code.

Azure, the heraldic term for the color blue, represented in engraving by horizontal lines.

Azurine, a European cockroach, blue in color.

Azurite, one of the commonest ores of copper, a basic copper carbonate, having the formula $2\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$. Its hardness is 3.5 to 4 and specific gravity about 3.8. It is a mineral of rare beauty, its usual color being a rich Prussian to azure blue, from which fact its name is derived. Its color is, however, often so dark as to appear nearly black, this frequently being true of its crystallized forms. These are very varied and complex, and belong to the monoclinic system. They are often transparent and have a most brilliant vitreous to adamantine lustre, and are beautifully striated, while their frequent association with bright green malachite adds much to the beauty of the specimens. These two minerals sometimes occur in stalactitic forms, the one encircling the other. Such specimens have been extensively cut and polished in cross sections and worked up for various ornamental purposes. The finest material of this kind comes from Morenci, Arizona, this locality also yielding exceptionally fine crystallized specimens rivaling those from its other most celebrated localities, Bisbee, Ariz., and Chessy, France. Its occurrence at the latter locality, which has been famous for many years, has led to the frequent use of the name "chessylite" for azurite, especially in Europe. Many other localities yield choice specimens, the copper mines of the western portion of the United States being especially celebrated. In New Mexico curious pseudomorphs of native copper after azurite "balls" occur in large numbers, while pseudomorphs of malachite after azurite are very common.

Azymites (Lat. *azymus*, unleavened), a term applied by the Eastern to the Western Church because the latter used unleavened bread in the administration of the Eucharist. In the Western Church the point has never been regarded as of vital importance. The matter was considered at the Council of Florence (1439). The Western Church, called the Greek schismatics Prozymites.

Azzarkal, az'ar-kāl', Arabian mathematician and astronomer: b. Cordova in the first half of the 11th century. He was royal astronomer of Al-Mamoun, king of Toledo. He invented divers instruments for making observations, constructed a water-clock of extraordinary dimensions, as well as a planisphere and an astrolabe, upon new principles.

Azzubeydi, a'zoo-bi'dē, **Mohammed Ibn el Hasan**, Arabian lexicographer: b. Seville, 927; d. 982. He was cadi of Seville and preceptor of Hiscam, son and heir of the Sultan. He wrote an abridgment of the great biography of the Spanish grammarians, by Khalil; a treatise on grammar, and a work upon the character of the syntax of the Arabic language.

B

B the second character in our alphabet, holds the same relative place in the alphabet of all European languages except the Russian and two or three others, as Servian and Bulgarian: in these alphabets the symbol B holds the third place, yet it stands not for our mute B but for a labial (not denti-labial) V or W; while in the second place stands a modified form of B with the same phonetic value as our B. The Russian alphabet is derived from the scheme of the monk Cyril, one of the first evangelists of Bulgaria, who translated into the language of the Sclavonians parts of the Bible. To do this it was necessary to contrive new characters for designation of sounds alien to the Greek language, and to modify existing Greek characters. But as in his time,—the 9th century,—and at a much earlier date, the current phonetic value of B was, as it still is, labial V, Cyril retained the symbol B as representing that V sound, while for the mute labial B he devised the symbol Б. With this exception the character B has from immemorial time held the second place in the alphabets of all the Aryan languages of Europe, as well as in Hebrew and Aramaic, Phœnician, Arabic, and Coptic. The most ancient form of this symbol, both in Greek and Latin, was **β** with two angular loops, which were afterward rounded. The most ancient form of the symbol B among the Phœnicians was not unlike the Arabic figure 9, namely, ٩. The Greeks not only added a second loop but they reversed the position of the loop by setting it on the right of the upright stem; and they similarly transposed the loop of the Phœnician sign ٩ which they made P (rho, our R). The difference between the two labials B and P is that P is an absolute mute, in pronouncing which the voice is completely obstructed before the lips are drawn apart, while B is sonant, though the lips be still compressed: in the effort to pronounce B the voice is heard even before the lips are parted; but in pronouncing P no sound is heard while the lips are compressed; and when they are opened there is emission of breath but no voice. B and P substitute each other in words common to two or more languages and in transmutations of words within one language. Examples: Latin *pila* is English and German *ball*. *Bretzel* is commonly pronounced *pretzel*; but it is of the same origin as the English word *bracelet*, from Latin *brachiale*, an armlet, bracelet; and *bretzel* means also handcuffs. B is nearly allied also to F, Th, V, and W; thus beech (German *buche*)

is represented in Greek by *phegos* and in Latin by *fagus*; whale is from the same source as Greek *phalaina* and Latin *balaena*; *habere* in Latin becomes in French *avoir*; *caballus*, Latin, is French *cheval*; German *liebe*, English *love*; Latin *labium*, French *lèvre*. V and B are little discriminated in Spanish and we have in one of the epigrams of Martial proof that in his day natives of Vasconia (Navarre) pronounced B as V and *vice versa* when he wittingly scores the bibulous habits of that people by saying that for them not without reason *vivere* (to live) is *bibere* (to drink): so that one of that nature might say *vivimus ut bibamus*, and the meaning would be either, we live to drink or we drink to live. In the Roman catacombs in sepulchral inscriptions of the 2d and 3d centuries of our era, *vixit* (lived), is in very many instances written *bixit*; and the name of a virgin martyr of that age is written *Bibiana*, and that form is retained in the Roman martyrology instead of the correct form *Viviana*.

B. A. C., the abbreviation used by astronomers in referring to 'The Catalogue of Stars of the British Association for the Advancement of Science,' by Francis Baily, London, 1845.

Baader, *bā'der*, **Benedict Franz, Xaver von**, German philosopher and speculative Roman Catholic theologian: b. Munich, 1765; d. 1841. He studied engineering, became superintendent of mines, and was ennobled for his services. He was deeply interested in the religious speculations of Eckhart, St. Martin, and Bohme, and in 1826 was appointed professor of philosophy and speculative theology in the University of Munich. During the last three years of his life he was interdicted from lecturing on account of his opposition to the interference of the Roman Catholic Church in civil matters.

Baal, *bā'āl*, a Semitic word denoting lord or ruler, and used to designate the Supreme Deity, by the Phœnicians and Chaldeans, and most of the Oriental nations, in the time of the Exodus. Baal seems to have been the sun-deity and was worshipped generally on high eminences, either natural or artificial. Fires were kindled on altars constructed for the purpose, and human sacrifices consumed in them. Baal was the same as Bel or Belus of the Babylonians and Assyrians, whose language was cognate to the Syriac and Phœnician. Collateral with these, may be placed the Osiris and Isis of Egypt, and the Gad and Meni, so frequently mentioned in the Scriptures, whom the Jews worshipped in the days of Jeremiah, having incorporated them into their own cultus from that of the Phœnicians or Carthaginians.

BAAL-ZEBUB — BABBAGE

The Scriptures give us an account of the facility with which the Jews embraced, and the tenacity with which they retained, the worship of Baal, who was identical with Moloch. Manasseh, the 16th king of Judah, set up altars to Baal in groves and high places, prepared for the purpose, and made his children pass through the fire to that god. Israel also was no less involved in this departure from the monotheism of the Mosaic system, to the duo-theism of Chaldaea. In Samaria, the capital of Israel, after the revolt of the 10 tribes, Baal was extensively worshipped, until the time of Jehu, who destroyed the altars of Baal, and tore down the high places of his worship. When the Jews were reproved by the prophet for their idolatry, they insisted that ever since they had left off sacrificing to the queen of heaven, they had been consumed by sword and famine. As early as the times of the Judges, the whole Jewish people served Baal and Ashtoreth, and the vocabulary of Palestine geography attests the domestication of Baal-worship among the inhabitants, in the frequency with which the word Baal appears as a component part of the names of towns and cities, as Baalath, Baalmeon, Baal-peor, and Baal-tamar. Remnants of Baal-worship have descended either through the Jews or the Gentiles even to our own time, and exist to-day in nearly all Christian countries. In Sir John Sinclair's statistical account of Scotland, he describes a ceremony which used to be celebrated in Scotland on 1 May (O. S.), in which the inhabitants of a district, having assembled in a field, dug out a square trench in which they built a fire and baked a cake, and cutting it into as many pieces as there were persons, and blacking one piece over with charcoal, threw them into some convenient receptacle, when each one, blindfolded, drew a piece. He who drew the black piece was sacrificed to Baal, to propitiate his favor for the coming year. The same ceremony was long observed in some parts of Scotland and Ireland, except that the person who drew the black piece was made to leap three times through the flames, instead of being sacrificed, a similar substitution to that instituted by Manasseh, who "made his sons pass through the fire to Moloch." This ceremony is known by the name of Beltane, or Baal-tine.

Baal-zebub, bā-āl'ze-būb. See BEELZEBUB.

Baalbek, bal'bēk, a locality in Syria, in a fertile valley at the foot of Antilibanus, 40 miles from Damascus, famous for its magnificent ruins. Of these, the chief is the temple of the Sun, built either by Antoninus Pius or by Septimius Severus; a rectangular building 290 by 160 feet. Some of the blocks used in its construction are 60 feet long by 12 thick; and its 54 columns, of which 6 are still standing, were 72 feet high and 22 in circumference. Near it is a temple of Jupiter, of smaller size, though still larger than the Parthenon at Athens, and there are other structures of an elaborately ornate type. Originally a centre of the sun-worship, it became a Roman colony under Julius Cæsar, was garrisoned by Augustus, and under Trajan acquired renown as the seat of an oracle. Under Constantine its temples became churches, but after being sacked by the Arabs in 748, and more completely pillaged by Tamerlane in 1401, it sank into hopeless decay. The work of de-

struction was completed by an earthquake in 1759. See Franberger, 'Die Akropolis von Baalbek' (1892); Baedeker, 'Syria and Palestine' (1894).

Baanites, bā-ā-nīts. See PAULICIANS.

Baar, bār, a plateau in Germany, in the province of Baden and Wurtemberg, formerly constituting a county of the Furstenberg principality. It contains the sources of the Danube.

Bab Ballads, *The*, a collection of humorous verses by W. S. Gilbert (q.v.) published in 1868. They form the source of several of the librettos of the Gilbert and Sullivan operas.

Bab-el-Mandeb, bab'el-man'dēb (Arabic, the gate of tears, so called from the danger arising to small vessels from strong currents), the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 20 miles distant stands the wall-like coast of Africa, rising in Rās es Sean to the height of over 400 feet. Within the strait, but nearer to Arabia, lies the bare, rocky Island of Perim, since 1857 occupied by the British as a fort; its guns commanded the entrance to the Red Sea. The strait on the east side of this island is called the Little Strait, and that on the west the Great Strait.

Baba, ba'ba (the old), in Slavonic mythology, a thunder-witch (the devil's grandmother), represented as a little, ugly old woman, with a monstrous nose, long teeth, and disheveled hair, flying through the sky in an iron mortar. By the Czechs she is called now the iron, now the golden, Baba. It is also a Turkish word, signifying father, originating, like our word papa, in the first efforts of children to speak. In Persia and Turkey it is prefixed as a title of honor to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba. A cape near the northwest point of Asia Minor is known as Baba.

Bāba Būdan, ba'ba boo'dān, a spur of the West Ghāts, Mysore, India, extending east for 15 miles, leaving a narrow opening at its west end for the passage of the Bhadra, and then south in an unbroken line for 20 miles, enclosing between itself and the main chain of the Ghāts a rich, but unhealthy valley. To this spur belong three peaks above 6,000 feet high, among these Mulaina-giri, 6,317 feet, the highest in the West Ghāts. On the slopes of Kalhatti, one of these peaks, is a hill station, a resort of Europeans during the heat. Coffee was first planted in India on another part of this spur toward the close of the 17th century, by a Mohammedan saint named Bāba Būdan.

Bab'bage, Charles, English mathematician and inventor of a calculating machine: b. near Teignmouth, England, 26 Dec. 1792; d. 18 Oct. 1871. He was educated first at the Totnes Grammar School, and Peterhouse College, Cambridge, where he became closely associated with Herschel (afterward Sir John) and Mr. Peacock, then tutor of Trinity College. Being in possession of an independent fortune, Babbage was in a position to devote all his time and

BABBITT — BABCOCK

energies to his favorite studies—mathematics and mechanics. In 1822 we find him broaching the idea of a difference engine, by which intricate arithmetical calculations could be correctly and rapidly performed. Through the recommendation of the Royal Society he received, in 1823, a grant from the government of £1,500 for the construction of such a machine. After a series of experiments lasting eight years, and an expenditure of £17,000 (£4,000 of which was sunk by the originator of the scheme, the balance voted by the government), Babbage abandoned the undertaking in favor of a much more complicated work, an analytical engine, worked with cards like the jacquard loom. The government, alarmed at the probable demands, refused to support Babbage in his new adventure, and as a quarrel ensued with his engineer, who withdrew his tools, the pet project was never completed. The machine, along with some 400 or 500 plans, was presented in 1843 to the King's College Museum, London. Among the many treatises he published on subjects connected with mathematics and mechanics, the most valuable and interesting are: 'On the Economy of Machinery and Manufactures'; 'The Decline of Science'; and an autobiographic sketch, 'Passages in the Life of a Philosopher.' In 1828 he was appointed Lucasian professor of mathematics in his university, an office he held for 11 years. In 1832 and 1834 he stood for Finsbury in the Radical interest, but was unsuccessful. He was one of the founders of the Royal Astronomical Society, and a Fellow of the Royal Society.

Babbitt, Isaac, American inventor: b. Taunton, Mass., 26 July 1799; d. 26 May 1862. He learned the goldsmith's trade; early became interested in the production of alloys; and in 1824 manufactured the first britannia ware in the United States. In 1839, he discovered the well-known anti-friction metal which bears his name, Babbitt metal (q.v.). For this discovery, the Massachusetts Charitable Mechanics' Association awarded him a gold medal in 1841, and subsequently Congress voted him \$20,000.

Babbitt Metal, an alloy of copper, tin and antimony, invented and patented in 1839, by Isaac Babbitt (q.v.) of Boston. It is soft and nearly white, and is widely used as an anti-friction metal. The proportions of the constituent metals vary considerably in modern practice. Babbitt's original alloy contained 24 parts of tin, 4 parts of copper, and 8 parts of antimony. Many engineers prefer a larger proportion of tin, and the following mixture is recommended as giving a tough and very serviceable metal: Tin, 96 parts; copper, 4 parts; antimony, 8 parts. Lead is also added, in many cases, on account of its cheapness. In small amounts it is not usually objectionable, but the Babbitt metal that is sold in the market, ready-mixed, usually contains a considerably larger proportion of lead than its price would indicate. The alloy is usually melted and run, while fluid, directly into the bearings on which it is to be used, a space from an eighth to half an inch thick being left for it between the box and the shaft that is to be supported.

Babcock, Earle Jay, American educator: b. St. Charles, Minn., 11 June 1865. After working extensively with the United States Geological Survey he was appointed in 1902 director of the State School of Mines of North Dakota,

and professor of chemistry and geology in the State University. He is the author of many special scientific articles and of geological reports.

Babcock, James Francis, American chemist: b. Boston, 23 Feb. 1844; d. Dorchester, Mass., 20 July 1897. He studied at Lawrence Scientific School, and became an analytical chemist and chemical expert. He was State assayer and inspector of liquors in Massachusetts, 1875-85, and city inspector of milk in Boston, 1885-89. While state assayer he brought about the insertion in the liquor statutes of the definition of the term "intoxicating liquor," known as the 3-per-cent limit. He is the inventor of the fire extinguisher which bears his name; a popular lecturer on scientific subjects; and has appeared as an expert chemical witness in important trials. He has published several reports on sanitation and the chemistry of food.

Babcock, Maltbie Davenport, American Presbyterian clergyman: b. Syracuse, N. Y., 3 Aug. 1858; d. Naples, Italy, 18 May 1901. He was graduated from Syracuse University in 1879, and Auburn Theological Seminary in 1883. He filled most successful and popular pastorates at Lockport, N. Y., Baltimore, Md., and at the Brick Presbyterian Church in New York. While on a visit to the Levant in 1901 he was seized with the Mediterranean fever and died in the International Hospital at Naples. A posthumous volume of his prose and verse, edited by his wife, appeared in 1901, entitled 'Thoughts for Every-Day Living.'

Babcock, Orville E., American military officer: b. Franklin, Vt., 25 Dec. 1835; d. 2 June 1884. He served with distinction in the Civil War, was a member of Gen. Grant's staff, and was made a brigadier-general of the regular army at the close of the war. When Grant was elected President, Babcock became his private secretary, and the superintending engineer of several important public works. He was indicted in 1876 for taking part in revenue frauds, but on his trial was acquitted.

Babcock, Stephen Moulton, American educator: b. Bridgewater, N. Y., 22 Oct. 1843. He was educated at Tufts College, Cornell University, and at Göttingen, Germany; and was graduated from Tufts College in 1866. He gave special attention to the chemistry of milk and its products, and was the inventor of the Babcock milk-tester. He was instructor of chemistry at Cornell University in 1875-6; professor of agricultural chemistry at the University of Wisconsin; and chemist to the New York State Experimental Station in 1888-1900. He is the author of numerous articles on the composition of milk and butter, and joint author with G. C. Caldwell of 'A Manual of Qualitative Chemical Analysis.'

Babcock, Washington Irving, American shipbuilder: b. Stonington, Ct., 21 Sept. 1858. He was graduated at the Brooklyn Polytechnic Institute in 1876, and at Rensselaer Polytechnic Institute in 1878. He was employed at the Roach Shipyard, Chester, Pa., in 1878-85, and with the Providence and Stonington Steamship Co., New York, in 1885-7; was superintendent of the Union Dry Dock Co., Buffalo, N. Y., in 1887-9; manager of the Chicago Shipbuilding Co., in 1889-99, becoming president of the latter in 1900.

BABEL — BABIRUSSA

Ba'bel, Tower of, the name of a structure in the Plain of Shinar, Mesopotamia. According to the 11th chapter of Genesis, it was begun by the descendants of Noah subsequent to the deluge, but not allowed to proceed to completion. It has commonly been identified with the great temple of Belus or Bel, one of the chief edifices in Babylon, and the huge mound called Birs Nimrud is generally regarded as its site, though another mound, which to this day bears the name of Babil, has been assigned by some as its site. Babel means literally "gate of God." The meaning "confusion" assigned to it in the Bible really belongs to a word of similar form. See **BABYLON**.

Babenberg, bā'bēn-bērg, a princely Franconian family, whose castle occupied the site of the later Bamberg Cathedral. They were most prominent in the wars of the 10th century. The Austrian dynasty of 976-1246 was formerly believed to be sprung from them.

Baber, bā'bēr (or "The Tiger"), the historical surname of Zehir-ed-din-Mohammed, the conqueror of Hindustan and founder of the so-called Mogul dynasty: b. 14 Feb. 1483; d. 26 Dec. 1530. Baber was of mixed Turkish and Mongol origin, but in feeling, as in personal characteristics, he was a Tartar (Turk), and often in his memoirs speaks most contemptuously of Mongols or Moguls. Yet Hindu ignorance has designated the throne which he established in India as that of the Great Mogul. At the age of 12, on his father's death, he ascended the insecure throne of Ferghana in Turkestan; soon after he was attacked on all sides by his uncles and other neighboring princes, which obliged him, in his turn, to assume the aggressive. Accordingly, at the age of 15, Baber seized on Samarcand, the capital of Timour, but, while thus engaged, a revolution at home deprived him of his sovereignty. After many years of an adventurous and romantic career, he raised an army, entered Hindustan, and was met by Ibrahim, the ruling Sultan of that country. The two armies fought the battle of Paniput, which decided the fate of India, on 21 April 1525. Baber, with his army of 12,000 men, completely overthrew that of Ibrahim, numbering 100,000, and entered Delhi in triumph. Difficulties and fresh foes had still to be encountered and mastered, but in the battle of Sakri, in February 1527, Baber utterly defeated the opposing Hindu princes, and then proclaimed himself Padishah, or emperor of Hindustan.

Babeuf, bā-bēf', or **Babœuf**, François Noel, French communist, who called himself Caius Gracchus: b. Saint-Quentin, 1760; d. 28 May 1797. He founded in Paris a journal called the 'Tribune of the People' (1794), in which he advocated his system of communism, known as Babœuvism, and contemplating absolute equality and community of property. His followers were called Babœuvists. Betrayed in a conspiracy against the directory, aiming to put his theories into practice he was guillotined in Paris. His principal works were 'Perpetual Register of the Survey of Lands' (1780), and 'Of the System of Population' (1794). See Advielle, 'Histoire de Babeuf et du Babouvisme' (1884).

Bābi, bā'be, the name of a modern Persian sect, derived from the title, Bāb-ed-Din (gate of the faith), assumed by its founder, Mirza Ali

Mohammed, a native of Shiraz, who, in 1843 undertook to establish a new religion from a mixture of Mohammedan, Christian, Jewish, and Parsee elements. His controversies with the *mollahs* shortly led to his confinement to his own house, where he formulated his doctrines, privately instructed his disciples, and increased his pretensions. The sect soon became numerous; but on the accession of Nasir-ed-Din in 1848, apprehending persecution, they took up arms, proclaiming the advent of the Bāb as universal sovereign. The insurgents were reduced by famine, and most of them executed (1849-50). The Bāb had held aloof from the revolt, but was arrested and put to death, after a long imprisonment, in 1850. His successor was recognized in the youthful son of the governor of Teheran, who retired to Bagdad, where he afterward lived quietly. An attempt of three believers to assassinate the Shah, in 1852, led to a persecution of the sect; numbers were tortured and burned, among them Gurrud-ul-Ain. Bābism is at present widely diffused in Persia; its members live in apparent conformity to orthodox Mohammedanism, but privately holding the Bāb's doctrines, which are contained in an Arabic treatise, 'Biyan' (the exposition), written by the founder himself. They form essentially a system of Pantheism, with Gnostic and Buddhist additions. All beings are emanations from the Deity, by whom they will ultimately be reabsorbed. Bābism enjoins few prayers, and those only on fixed occasions; encourages hospitality and charity; prohibits polygamy, concubinage, and divorce; discourages asceticism and mendicancy; and directs women to discard the veil, and share as equals in the intercourse of social life. See Andreas, 'Die Babis in Persien' (1896); Browne, 'A Traveler's Narrative Written to Illustrate the Episode of the Bāb' (1892).

Bab'ington, Anthony, English Roman Catholic gentleman: b. Dettick, Derbyshire, 1561; d. 20 Sept. 1586. He associated with others of his own persuasion to deliver Mary, Queen of Scots, but the plot being discovered, the conspirators were executed.

Bab'ington, Churchill, English philologist: b. Leicestershire, 1821; d. 13 Jan. 1880. He was educated at St. John's College, Cambridge, and was Disney professor of archæology there in 1865-80. He was a voluminous writer on ornithology, botany, archæology, numismatics, etc.; and a contributor to Smith's 'Dictionary of Christian Antiquities.'

Bab'ingtonite, a native, anhydrous silicate of calcium, iron and manganese, associated with an iron silicate having the composition $\text{Fe}_2(\text{SiO}_3)_3$. It is greenish-black in color, with a vitreous lustre, and crystallizes in the triclinic system. It occurs in Norway, Italy, and the British Isles, and in the United States has been found at Gouverneur, N. Y., and perhaps also at Athol, Mass. Its hardness varies from 5.5 to 6, and it has a specific gravity of about 3.36. The mineral was named for Dr. William Babington.

Babirussa, bāb'i-roo'sa, a wild hog of the East Indies, remarkable for the long, exposed, canine teeth of the male. The upper tusks, instead of growing downward in the usual way, turn and grow upward through the skin on each side of the snout and curve backward until, in old animals, they may be 8 or 10 inches long,

BABOONS

1. Bearded Ape (*Cynocephalus silenus*)

4. Hamadryad (*Cynocephalus hamadryas*)

and reach nearly to the eye. These hogs, which inhabit Celebes and Bouru, are almost hairless, long-legged, and active, and feed upon fallen fruits instead of rooting in the ground. One cannot see that the great tusks are of any present use, but Wallace suggests that they were useful to the ancestors of these pigs under different conditions, and were then kept worn down by service.

Babism, bab'izm. See BABI.

Babo, ba'bó, Josef Marius von, German poet: b. Ehrenbreitstein, 14 Jan. 1756; d. 5 Feb. 1822. He was professor of fine arts at Munich in 1778, and of æsthetics at Mannheim, and later became director in the Munich Military Academy, and superintendent of the theatre. He was the author of 'Otto of Wittelsbach,' a tragedy (1781); 'Oda' (1782); 'Dagobert, the Frankish King' (1787); 'The Pulse,' a comedy (1804), etc.

Baboo, bā'boo, or Babu, a Hindu title of respect equivalent to Sir or Mr. It is usually given to wealthy and educated native gentlemen, especially when of the mercantile class.

Baboon, bāb-oon', a large, long-haired, terrestrial monkey of Africa or Arabia, belonging to the genus *Cynocephalus*, of the family *Cercopithecidae*. All are of large size, have elongated, blunt muzzles, with nostrils at the extreme end, and great canine teeth which together give the face, when seen in profile, a dog-like aspect. The naked parts of the face, as well as the great callosities upon the buttocks, are often brilliantly colored. Some also have shaggy manes, and all add to their repulsive appearance a fierceness of disposition which makes them more feared than perhaps is necessary, for they rarely, if ever, have attacked human beings. All of the species go about in troops under the guidance and protection of several old males. They are rare in wooded regions, preferring rocky and bushy districts, like those in northern Africa, in Arabia, and in southeastern Africa. As their fore and hind limbs are of nearly equal length, and very stout, they go mostly on all fours, galloping swiftly and climbing rocks with agility. Their food is principally vegetable — fruits, berries, young sprouts, etc; but they also eat insects, worms, snails, and such young birds or small animals as they are able to catch. They do great damage to the plantations of the native Africans, ruthlessly spoiling much more than they are able to eat. The ancient Egyptians seem to have trained them to pick fruits, but within recent times their confinement in menageries, where they live and breed well, is the extent of their domestication. There is nothing attractive about any of them, either in appearance or disposition.

Among the best known is the great Arabian or sacred baboon, or *hamadryad* (*Cynocephalus hamadryas*), the one represented upon Egyptian monuments, and venerated by the primitive Egyptians. It is supposed that their habits of noisy activity at sunrise, as though adoring the sun-god, is the basis of this very ancient form of worship. Mummies of baboons are commonly found in tombs in the Nile valley; and the species itself is still abundant from the Sudan to southern Arabia. It is ashy gray in color, and has a heavy mane. The great baboon of South Africa, common in the wilder mountains of Cape

Colony, is the chacma (*Cynocephalus porcaurus*), which is dark-brown and has long hair but no mane, and a tail about half the length of the body, terminated by long, black tufts. This is the one most commonly seen in menageries. The mandril (*Cynocephalus mormon*) is still larger, exceeding a mastiff in size. It has short legs, a mere stump of a tail, and an enormous head, with a crest of greenish hair upon the forehead, and a beard which is orange-yellow; while the naked parts of the face consist mainly of a huge nose, light-blue in color, the skin of which is folded into ridges. The naked buttocks are bright scarlet. This ugly brute is one of the most ferocious and justly dreaded animals of the Congo forests. In the same region lives a second similar species called the drill (*Cynocephalus leucophaeus*), which differs mainly in lacking the bright colors and ribs of the nose of the mandril. Several other baboons live in West Africa, but are not well known, although one reddish-brown species, the Guinea baboon (*Cynocephalus sphinx*), is commonly seen in the hands of showmen. A large monkey of southern Abyssinia, looking like a black, clipped French poodle, is substantially a true baboon, although it belongs to another genus; it is the gelada (*Theropithecus gelada*). Consult 'Cassell's Natural History,' Vol. I. (1885).

Ba'brius, a Greek fabulist whose fables in verse are variously referred to the time immediately preceding the Augustan age, and to the 3d century of our era; his name also shows variants, as Babrias, Gabrius. Till 1842 only a few fragments of Babrius were known to be extant; but in that year, in the Laura of Mount Athos was discovered a manuscript containing 123 of his fables. In 1846 Sir George Cornewall Lewis published them together with the pre-existing fragments, and in 1859 or 1860 appeared a good English version by James Davies. The fables have also been edited by W. G. Rutherford (1883) and by Crusius (1897).

Babuyanes, ba'boo-yan'ez, or Madjicosima Islands, a number of islands lying about 30 miles north of Luzon, and generally considered the most northern of the Philippines. The chief islands are Kamiguin, area 54 square miles; Babuyan Claro, 36 square miles; Calayan, 37 square miles; Fuga, 21 square miles; and Dalupiri, 20 square miles. They are subject to the Loo-Choo Islands; aggregate population about 12,000.

Bab'ylans or Babylus, Saint, a bishop of Antioch between 237 and 250. He declined to admit to public worship the Emperor Philip, who had murdered his brother Gordianus in order to gain the throne. In the Roman calendar his day is celebrated on 24 January; in the Greek on 4 September.

Bab'ylon, See BABYLONIA.

Babylon, N. Y., village in Suffolk County, Long Island, 37 miles east of New York; popular as a summer resort on account of its fine beach, and as a rendezvous for sportsmen by reason of its opportunities for fishing. Pop. (1900) 2,157.

Babylonia. Discoveries of the recent decades seem to confirm the idea that Babylonia is the cradle of civilization. The country, which is nearly enclosed by the Tigris and Euphrates from Bagdad to the Persian Gulf, is bounded on the north by Mesopotamia; on the east by the

BABYLONIA

plain of Elam; on the south by the Persian Gulf; and on the west by the Arabian desert. It constitutes the largest portion of the country now known as "Irâq el Arabi." A considerable part of this alluvial plain has been made through deposits by the river. This land-making process continues at the present time at the rate of about 70 feet per year.

At one time the plain was covered with a perfect network of canals which carried agricultural prosperity to every part of the land. The neglect of these has changed the conditions of the country so completely that instead of a fertility which was once the wonder of the ancient world, a cheerless waste now presents itself. Some months of the year the country is partially covered with swamps and marshes, while the remaining portion is a desolate plain.

Here and there throughout the land are to be seen mounds of débris, every one of which covers the remains of a long-forgotten civilization. About the middle of the last century a number of English explorers, Loftus, Layard, and Taylor, visited the ruins of some of the important cities. Through their tentative investigations Nuffar (Nippur or Calneh), Warka (Uruk or Erech), Senkera (Larsa), Muqayyar (Ur), Abu Shahrain (Eridu), besides Babylon, Borsippa, and other cities were located. A few decades later Rassam, also an Englishman, discovered that the ruins known as Abu-Habba represented the ancient Sippara; and decided definitely also that Tell-Ibrahim was Kutha (Cutha). The ancient names of most of these cities were known through the Old Testament.

The first methodical and extensive excavations in the country were begun by the French, under De Sarzec, at Tello (Shir-pur-la), in 1876. These were followed in 1889 by those of the Americans, representing the University of Pennsylvania, under Peters, for about six months, followed by Hilprecht and Haynes. For a few months in 1894 Scheil, a Frenchman, in the interest of the Turkish government, excavated at the ruins of Abu-Habba (Sippara). The Germans under Koldewey and Moritz devoted several months to the exploration of two sites known as El-Hibba and Surghul; but in 1900 Koldewey began systematic excavations among the mounds of ancient Babylon. It is expected that the Germans at Babylon, the French at Tello, and the Americans at Nuffar will continue their operations for many years.

The excavations at Tello and Nuffar have been exceptionally fruitful in important results, especially those conducted at the latter place by the University of Pennsylvania. At Tello were uncovered the remains of an ancient civilization of the 3d and 4th millenniums B.C., representing the Sumerian people. The Nippur excavations yielded antiquities of the Semitic race as well as the Sumerian. At this city the excavators were able to examine the remains of the longest period of occupation known up to the present time. The lowest stratum of débris yielded antiquities which belong to the 7th millennium B.C., while the city continued to be inhabited until about 1000 A.D.

The earliest inhabitants of the country, which was known in the early period as Shumer (Biblical Shinar), are called Sumerians. By the aid of the statues and inscriptions discovered, the physiognomy and customs of this people become comparatively well known. The remains

of their civilization as regards sculpture, engraving, etc., are of an exceptionally highly developed character as revealed by the antiquities, some of which are remarkable for their beauty and the fineness of their execution. They show that the flower of art in this country belongs to about the 4th millennium B.C. Their writing also, instead of being primitive, is so far removed from the original hieroglyphs that in many instances the pictorial outline can no longer be recognized. These things demonstrate the fact that back of that which is now known as the earliest there must be a long period of development covering many centuries.

The Sumerians spoke an agglutinative tongue which belongs to that great unclassifiable group of languages known as Turanian. Clay was principally used as their writing material. The impression made by the stylus upon the soft clay has the appearance of a wedge, for which the Latin word *cuneus* is used; hence cuneiform writing. The characters, having ideographic and phonetic values, are made up from one to a dozen or more wedges. There are over 500 characters, some of which have many values. For the different characters and combinations of two or more, about 20,000 values are already known.

It has not been ascertained whence the Sumerians or Semites came. In 4500 B.C. the latter had already entered the land. They gradually conquered their predecessors, the Sumerian people, and adopted their script for their own language. Side by side these two people lived in the country until the amalgamation known to us as Babylonian was more or less complete; at least the Semitic population succeeded in superseding the Sumerian, whose identity seems to be practically lost in the later period. The Sumerian language, however, continued to be used by the Babylonians until the close of their history, especially for official, legal and liturgical purposes.

The number of inscriptions, small and large, discovered in Babylonia up to the present time, number fully 150,000. At Tello, De Sarzec unearthed a library containing about 30,000 tablets belonging to the time of Gudea 3000 B.C. The temple library at Nippur, although only one twelfth part excavated, has yielded to Prof. Hilprecht over 20,000 tablets belonging to the 3d millennium B.C. It contained mathematical, astronomical, medical, historical, linguistic, religious, etc., texts, arranged and classified according to subjects. Besides the clay tablets, cylinders, and prisms, most important documents in stone have been found, which have furnished the data upon which the knowledge of the early period is largely based.

Through other sources, particularly the Babylonian duplicates found in Ashurbanapal's library at Nineveh, considerable is known concerning the literature of this people. Notably might be mentioned the Creation and Nimrod epics, the Deluge story, which greatly resemble the Biblical accounts; Ishtar's descent into Hades; the Etana legend; Adapa and the South Wind, etc. Here properly should be mentioned also the codes of laws upon which the decisions of the kings and judges were made, particularly the code of Hammurabi (Amraphel, Gen. xiv.), discovered by the French, in Susa, under De Morgan. It consists of 282 laws written on a stela which stands over seven feet high. This had been carried away by the old national enemy

BABYLON.

BABYLONIA

of Babylonia, the Elamites. Very extensive also is the knowledge of the customs and manners of the people gained through the thousands of contract tablets dated in the reigns of kings of all periods. Practically every kind of legal and domestic contract imaginable, mortgages, deeds of sale, promissory notes, guarantees, etc., the archives of business firms, notably the Egibi House of Babylon, and the Murashu Sons of Nippur have been found. Most valuable for the decipherment of the inscriptions have been the syllabaries, or sign lists, in which the different values of characters are given. Commentaries; lists of gods, names, places, temples, animals, stones, etc.; incantations, hymns, penitential psalms, prayers, etc., are included among the tablets discovered.

The earliest inscriptions reveal a polytheism in a developed state. Most of the gods have Sumerian as well as Semitic names. Until the religion of the Sumerians, or of the Semites, prior to their occupation of this country is known, it will be impossible to ascertain with which people the different gods and religious conceptions originated. The pantheon, which was practically different in every period of Babylonian history, is exceedingly large. Some of the gods mentioned most frequently in the inscriptions are: Anu, Bêl, and Ea, the important triad of the early period; Merodach, Shamash, Sin, Ishtar, Nergal, Nebo, Nusku, Ninib, Gula, etc.

Each city had its temple, which was dedicated to some particular god; for example, Ekur, at Nippur, was sacred to Bêl; Esagil, in Babylon, to Merodach. In addition to the patron deity, shrines to other gods were found in each sanctuary. At Nippur, besides Bêl, 24 other gods were worshipped, for whom shrines were set up within the temple precincts. Through the researches of Prof. Hilprecht in the trenches at Nippur, and in connection with the inscriptions discovered, the real conception of a Babylonian temple and its tower is made known for the first time. The temple had an inner and outer court, both of which were nearly square, the latter being somewhat smaller than the former. The prominent feature of the temple architecture was the *ziggurat*, or storied-tower, which occupied nearly one third of the area of the inner court. In close proximity to the tower stood the temple proper, where the sacrifices were offered. The *ziggurat* consisted of quadrangular platforms, one superimposed upon the other, on the top of which was to be found the shrine. The number of platforms varied according to the period and ability of the builder. In the 3d millennium B.C. the number generally appears to have been three. The *ziggurat* had its origin in the earliest pre-Semitic period, when it was regarded as the tomb of the god. At that time it was the central feature of a fire necropole, or cemetery. The Sumerians cremated their dead. In an early stratum at Nippur one of their crematoriums was found. The remains of the incineration were placed in jars, thousands of which were found buried around the *ziggurat*. It is not known what the Semites did with their dead, but when they became the dominant people of the land the conception of the temple and *ziggurat* seems to have been changed, for thereafter no burials are found within the courts of the temple.

In their cosmology the Semitic Babylonian conception of the earth was a mountain over which the god Bêl ruled. This they believed extended down into Ea's region (subterranean waters), and also that it reached up unto that of Anu (Heaven). They regarded the *ziggurat* as symbolical of the earth, the dominion of Bêl. In their inscriptions, therefore, concerning the building or restorations of these towers, the following expression is repeatedly found: "I laid the foundations of the *ziggurat* in the breast of the earth and built it up that its head was in the heavens" (compare the story of Babel, Gen. xi), thus showing that the *ziggurat* was a representation of Bêl's kingdom, the earth.

In connection with the temple library at Nippur a school or department of instruction was found. Within its rooms were discovered textbooks, and exercises of the students. At Sippara a school similar in character was also found. The complete excavation of all important Babylonian cities will doubtless bring to light a temple, a library, and a school in each.

Recent investigations show that in a general way the Babylonian chronology coincides fairly well with the Hebrew from about the time of Abraham. A great many rulers prior to Hammurabi (Abraham's co-temporary, about 2200 B.C.) are known through their inscriptions. King Nabonidus, the historian and archaeologist (556-538) stated that Naram-Sin had founded the temple of Shamash at Sippara 3,200 years before his time. This in round numbers would make his father, Sargon's date 3800 B.C. Sargon was a powerful ruler; having conquered all the city kingdoms of his land, he extended his conquests as far as the Mediterranean. Many pre-Sargonic rulers are also known, of whom notably may be mentioned Lugalzaggisi, about 4500 B.C., who conquered the ancient world from the Persian Gulf to the shores of the Mediterranean. A number of important rulers of Tello also belonging to this period are known. Between Sargon and Hammurabi several dynasties are more or less completely filled out. Among the important rulers whose names are known should be mentioned Gudea about 3000 B.C., who held sway over the whole of Babylonia; Ur-Gur about 2700 B.C., who erected temples in Ur, Nippur, Erech, and other cities; and also his son Dungi, who extended his rule over parts of Elam and Syria. Hammurabi about 2200 B.C. inherited a throne which was subject to Larsa, but this mighty sovereign overthrew its king and also Elam's, and succeeded not only in uniting the petty principalities under one rule, but he reorganized them in such a way that the kingdom had an uninterrupted history for several centuries. Hammurabi was the sixth king of the first dynasty of Babylon. This was followed by the so-called second dynasty of Babylon; the foreign dynasty of Cassite rulers; 1580-1180 B.C., the dynasty of Pashi 1177-1043, and other rulers. During the period which followed, Babylonia was subject to Assyria until the powerful Neo-Babylonian rule began with the Chaldean Nabopolassar, 626-605, and his son Nebuchadnezzar II. 605-562. These were succeeded by Evil-Merodach, 562-560; Neriglissar, 560-556; Labo-soarchod, 556; and Nabonidus, 555-538. With the overthrow of the latter and his son Belshazzar, the Achæmenian rule began, which continued until the time of Alexander the Great. This

BABYLONIAN EXILE ; BACACAY

great conqueror was followed by the Seleucid and Arsacid kings. Under the Parthians all that remained of Babylonian culture died out, when the knowledge of the language and writing was entirely lost. Jews continued to live on some of the mounds of Babylonia until about 1000 A.D., when finally the country was given up to the Bedouin and the Arab.

Bab'ylo'nian Exile, or Captivity. It seems to have been part of the statecraft of the ancient Assyrians to remove the people of conquered nations and plant them in unoccupied parts of the dominion, as far distant as possible from the home country of the victims. This custom grew out of civil and geographical conditions. The degree of national intercourse requisite for maintaining a proper ascendancy over the subjugated nation could not be maintained if they were allowed to remain in their own land. Consequently, deportation was necessary—a process which has come to be designated in our language by the word captivity. Anciently, deported nations were not treated with that cruelty we are in the habit of associating with the captive. The captivity of the Jews, who are more especially to be treated in this article, demand the preceding remarks in order to aid in a proper understanding of the frequent notices we find in the Scriptures of the consequence to which these people attained in their foreign residences. There are two Babylonish captivities of the Jews, having their beginnings at different times, although their endings were synchronous. In the civil dissensions following the death of Saul, and culminating at the death of Solomon, the tribes north of the mountains of Ephraim, and those east of Jordan, separated from the rest, leaving Judah and Benjamin in the naturally fortified province of the south. To the north of the revolted tribes lay the kingdom of Syria, then powerful and extensive. Syria had an old feud with Israel, ever since David had made Damascus, the Syrian capital, tributary to himself. Rezon had regained the city under Solomon, but was "an adversary to Israel all the days of Solomon." The attention of Syria was now turned to the defenseless condition of the revolted tribes. They had no longer the fortifications and fastnesses from which David had sallied forth to the northern plains at the foot of the Anti-Lebanon. Judah had,

meanwhile, made a treaty, in the reign of Asa her third king, with the Syrian power, who, by his counsel and stratagem, had been induced to break a former league with Israel (1 Kings xv.). Judah also, fearing inroads from the north, had built two new fortifications in the passes of Benjamin (Geba and Mizpeh), and used all her arts to keep herself in favor with Syria, and on the other hand turned her pampered ally against the revolted and unprotected tribes at the north. Israel, tired at length of the continual exposures to Syrian invasion, and exasperated at the immunity and prosperity of the rival Judah, formed a conspiracy with Syria (during the reign of Pekah in Israel and Ahaz in Judah) against her southern antagonist. In the emergency Judah appealed to the Assyrian power, and Tiglath Pileser came against Israel, carried captive a portion of its inhabitants, and then marched upon Syria, slew its king, subdued its capital, and absorbed it into the Assyrian empire, from which it reappears only in the time of Alexander the Great. The successor of Pileser, exasperated by an attempted conspiracy of Hoshea with the king of Egypt, took Samaria, and subdued Israel to a tributary relation, taking away to Babylon the people whom Pileser had left in the first deportation. Thus was accomplished the first captivity of the numerically most powerful branch of the divided house of Israel (721 B.C.). They were first in the subjugation to foreign power from purely geographical considerations. A little more than a hundred years after, Judah, from her mountain fastnesses, followed Israel into the Assyrian empire, in the second great Babylonish captivity. Disregarding some chronological differences, Judah seems to have been progressively carried into captivity, like Israel, by at least two, and perhaps three successive deportations. The first was 598 B.C., and was probably made with the direct object of colonizing the city of Nineveh, which the Assyrian monarch was then endeavoring to restore. The second was in the reign of Zedekiah. Judah had for three successive reigns been heavily tributary to Assyria. Zedekiah rebelled against the tribute, and, like Israel, further exasperated her master by calling upon Egypt in her extremity. In revenge, Nebuchadnezzar burnt the temple and city, put out the eyes of Zedekiah, and led away the people to Babylon, and so ended the Jewish kingdom (588 B.C.), never again to be restored to a national existence; for when, 70 years after the second captivity, the permission to return was given, only a very small part of the Jewish people were in a condition to desire a removal, having become thoroughly naturalized in their foreign dwellings; and even if they had desired it, it would have been only a return to a Medo-Persian satrapy, not to the glory of their ancient kingdom and temple-worship. They remained by the rivers of Babylon and wept. See DANIEL; EZEKIEL; EZRA; JEWS.

The term "Babylonish Captivity" is frequently applied by writers of Church history to the residence of the Popes at Avignon for nearly 70 years.

BACALAO — BACCHUS

Bacalao, bāk'ka-lā'ō. See **CON**.

Bacara, ba-kar'ra, Philippines, a town of Luzon in the province of Ilocos Norte. Pop. 13,735.

Baccanarists. See **JESUITS**.

Baccarat, ba-ka-ra', a town of France, in the department of Meurthe-et-Moselle, having the most important plate glass works in France. Pop. (1900) 6,772.

Baccarat, a game of Italian origin played with ordinary playing cards; very simple in details and freer from complications than most games at cards. Any number of players may participate, and as many packs of cards may be used as necessary, the number being increased to correspond with the number of players. The member of the party selected to act as banker deals out the cards from a box, after they have been shuffled. The face cards each count 10, and the others according to the numbers of their spots. After the bets have been made, the banker deals two cards to each of the players, including himself, but the other players must receive their cards before the banker is served. The aim of the players is to make the numbers 9, 19, 29, or as nearly those as possible, as 8, 18, and 28. Any player is at liberty either to "stand" or to be "content" with the two cards at first dealt, or to call for more, at the risk of exceeding 29, when his stake is forfeited to the dealer. If, after the first distribution of two cards to each, any player has a "natural,"—that is, a sum making 9, or next in value, 19,—he declares it wins, and the banker pays all who hold superior hands to his own, and claims from those holding inferior hands. The players stake their money separately, there being, in fact, as many separate games in progress as there are players, and the spectators may wager their money on any one of them, all of which must be accepted by the banker. Prior to the banker making a start, he names the amount of the bank. Any one sitting down at the table has the right to call the whole of the bank, selecting the left or the right on which to pick up the cards. Previous to the banker dealing the cards, it is the duty of two croupiers, one on the right and the other on the left, to count up the stakes deposited on either side, and then make up the bank. Thus the banker knows, to the smallest coin, the exact amount of his liabilities.

Bacchanalia, bāk'ka-nā'li-a, feasts in honor of Bacchus, or Dionysos, characterized by licentiousness and revelry, and celebrated in ancient Athens. In the processions were bands of Bacchantes of both sexes, who wandered about rioting and dancing. They were clothed in fawn skins, crowned with ivy, and bore in their hands *thyrsi*, that is, spears entwined with ivy, or having a pine cone stuck on the point. These feasts passed from the Greeks to the Romans, who celebrated them with still greater dissoluteness till the Senate abolished them, 187 B.C.

Bacchante, bāk-kān'tē, a person taking part in revels in honor of Bacchus.

Bacchiglione, bāk'ke-lyō'ne, a river of northern Italy. It rises in the Alps, passes through the towns of Vicenza and Padua, and enters the Adriatic near Chioggia, after a course of about 90 miles.

Bacchus, bāk'kūs, or **Dionysos**, the god of wine. His history is one of the most perplexing in the Greek mythology. Semele was pregnant with him by Zeus, but became a victim of the craft of Hera. Zeus hastened to save the unborn fruit of his embrace, and concealed it till mature in his own thigh. He afterward committed the infant to Hermes, who carried him to the nymphs of Nysa in India, where he grew and prospered. His teacher was Silenus, afterward his constant companion.

In the vales of Nysa Bacchus invented the preparation of a beverage from grapes, and taught the planting of vines. To spread the knowledge of his invention he traveled over almost the whole known world, and received in every quarter divine honors. Drawn by lions he began his march, which resembled a triumphal pomp, with a great suite of men and women, Sileni, Satyrs, and Mænades. Inspired by the presence of the god, rejoicing, brandishing the *thyrsus*, and crowned with vines and ivy, they danced around him, shouting, "*Evoc! Eleus!*" over hill and valley, accompanied by the tones of Phrygian flutes and timbrels. The Thebans would not acknowledge his divinity, and Pentheus armed himself against him. Bacchus resolved to punish the crime, and inspired the women with a fury which drove them from their dwellings to wander on Mount Cithæron. Pentheus himself was torn in pieces by his own mother and her sisters, to whom he appeared a wild beast. Bacchus punished the daughters of Mynias, who derided his feasts, with frenzy and transformation. At Naxos some Tuscan sailors attempted to carry him off to Italy, supposing him from his purple robe to be the son of a king. They fettered him; but the fetters fell off, vines and ivy entwined the vessel, and kept it fixed in the midst of the sea: the god transformed himself to a lion, and the seamen, seized with madness, leaped into the waves, where they were changed into dolphins. On the other hand, he rewarded such as received him hospitably and rendered him worship, as, for instance, Midas, who restored to him the faithful Silenus.

His love was shared by several; but Ariadne, whom he found deserted upon Naxos, alone was elevated to the dignity of a wife, and became a sharer of his immortality. To confer the same favor on his mother, Semele, he descended into the realms of Pluto, and conducted her to Olympus, where she was henceforth called Thyone. In the dreadful war with the giants he fought heroically, and saved the gods from impending ruin. During the rejoicing for victory Zeus joyfully cried to him, "*Evan, evoc!*" (Well done, my son!), with which words Bacchus was afterward usually saluted. We find him represented with the round, soft, and graceful form of a maiden rather than with that of a young man. An ornament peculiar to him is the tiara. His long waving hair is gathered behind in a knot, and wreathed with sprigs of ivy and vine leaves. He is usually naked; sometimes he has an ample mantle hung negligently round his shoulders; sometimes a fawn skin hangs across his breast. The earlier bearded Bacchus is properly of Indian or Egyptian origin. His head is sometimes shown with small horns (the symbol of invincible force). In his hand is borne a *thyrsus*, or a drinking cup. The bull, panther, ass, and goat were symbolically associated with this god.

BACCHYLIDES — BACH

The feasts consecrated to Bacchus were termed *Bacchanalia*, *Dionysia*, or in general *Orgia*. They were celebrated with peculiar solemnity in Athens, where the years were universally reckoned by them, and during their continuance the least violence toward a citizen was a capital crime. The great Dionysia were celebrated in spring. The most important part of the celebration was a procession representing the triumph of Bacchus. This was composed of a train of Bacchantes of both sexes, who were masked, clothed in fawn skins, crowned with ivy, and bore in their hands drinking cups and rods entwined with ivy (*thyrsi*). Amidst this mad crowd marched in beautiful order the delegated bodies of the *phratia* (corporations of citizens). They bore upon their heads consecrated baskets, which contained first-fruits of every kind, cakes of different shape, and various mysterious symbols. This procession was usually in the night-time. The day was devoted to spectacles and other recreations. At a very early hour they went to the theatre of Bacchus, where musical or dramatical performances were exhibited. Thespis, known as the inventor of tragedy, is said to have introduced into the Bacchic performance an actor who carried on a dialogue with the *coryphaeus* (leader) regarding the myths narrated of Bacchus or some other divinity. The chorus surrounding its leader, stood on the steps of the altar of Bacchus, while the actor occupied a table. Some regard this as the origin of the stage. The vintage festivals in rural districts were celebrated by Bacchic processions, ruder in form than those of Athens, but characterized by the same wild license and ribaldry. Coarse ridicule of individuals was a marked feature of these occasions.

Bacchylides, bāk-kīl'ī-dēz, Greek poet who flourished about 470 B.C.; a native of Julis, a town on the Island of Cos. He was a cousin of the still more famous lyric poet Simonides, with whom he remained for some time at the court of Hiero in Sicily. He traveled also in the Peloponnesus, and is said to have been a rival of Pindar. Until recently, this poet was known to the modern world only in fragments of beautiful versification. In 1895, however, a well preserved text was discovered and published, and Bacchylides has now taken permanent place as a master of Greek verse. An English translation of the poems appeared in 1897.

Bacciocchi, bā-chōk'kē, **Felice Pasquale**, Corsican captain: b. Corsica, 18 May 1762; d. Bologna, 27 April 1841. In 1797 he married Maria Elisa Bonaparte. In 1805, when Napoleon made his sister Princess of Lucca and Piombino, Bacciocchi was crowned with his wife. After the emperor's fall, he lived quietly and in reduced circumstances at Bologna.

Bacciocchi, Maria Anne Elisa Bonaparte, the eldest sister of Napoleon Bonaparte: b. Ajaccio, Corsica, 1777; d. 7 Aug 1820. She married Felice Bacciocchi, and was created by her brother, in 1805, Princess of Lucca, Piombino, Massa, and Carrara, and in 1809 Grand Duchess of Tuscany. She shared her brother's fall and spent her last years in Austria, dying on her estate near Trieste. Her only son died in 1833, and her only daughter, the Countess Camerata, in 1869.

Bach, bāh, **Alexander von**, Austrian statesman: b. Loosdorf, 4 Jan. 1813; d. 15 Nov. 1892. He was minister of justice in 1848, of the interior in 1849-59; and, subsequently, ambassador to Rome. In 1855, he negotiated the concordat with the papacy which brought Austria into submission to the Roman Church.

Bach, Heinrich, German musician: b. 16 Sept. 1615; d. 10 July 1691. He was the father of Johann Christoph and Johann Michael Bach; organist at Arnstadt.

Bach, Johann Christian, German musician: b. Erfurt, 1640; d. 1682. He was a son of Johannes Bach, the great uncle of Johann Sebastian Bach.

Bach, Johann Christian, German musician: b. Leipsic, 1735; d. 1782. He was a son of Johann Sebastian Bach, and was organist in the Cathedral of Milan 1754-9, and in London, 1759-82, from which residences he was sur-named "the Milanese" and "the English." He composed operas, masses, *Tc Deums*, etc.

Bach, Johann Christoph Friedrich, German musician: b. Leipsic, 1732; d. 1795. He was a son of Johann Sebastian Bach, and was for a long period music master to Count Schaumburg at Buckeburg.

Bach, Johann Michael, German composer and instrument maker: b. 1648; d. 1694. He was a son of Heinrich Bach and the father-in-law of Johann Sebastian Bach.

Bach, Johann Sebastian, one of the world's great composers: b. Eisenach, Saxony, 21 March 1685; d. 28 July 1750. Left an orphan in boyhood he came under the protection of his older brother, Johann Ambrosius, from whom he received his first musical instruction. The death of his brother left Sebastian dependent for support upon his own efforts, and to earn a livelihood he entered the choir of St. Michael's Church in Lüneburg. In 1703 he became court musician at Weimar, the following year organist at Arnstadt, and in 1708 court organist at Weimar. While holding this office he labored to make himself master of every branch of music. In 1717 he was made director of concerts, and six years afterward director of music and cantor to St. Thomas' School, Leipsic, an appointment which he held till his death. About 10 years later the distinctions of kapellmeister to the Duke of Weissenfels and court composer to the King of Poland were conferred upon him. Bach, who had a son in the service of Frederick the Great, received a pressing request to visit Potsdam, on the occasion of a concert there. He went, and acquitted himself to the satisfaction of that monarch, some of whose music he played at first sight. Bach's close studies affected his eyes, and an operation left him totally blind and hastened his death. His best work as composer was done at Leipsic, often in connection with his work at St. Thomas' School. Bach was not only a great composer but a remarkably fine organist, having no rival but Handel among his contemporaries. In composition he naturally owed much to his predecessors, but he surpassed them all, and in many fields of his art was a discoverer. Bach wrote many kinds of music for different instruments, and for the voice, his organ fantasies, fugues and preludes stand pre-eminent among organ pieces; his sacred music, church cantatas, Passion and

BACH — BACHIAN

Christmas music is also of the best, both for its religious spirit and its artistic composition. Only a small portion of Bach's work appeared in print during his lifetime and some of it has been lost. The largest collection of his compositions is that published by the German "Bach-Tesellschaft" in 59 volumes, with supplements.

Bibliography.—Spitta, 'Life of Bach'; and Poole, 'Bach, His Life and Works.'

Bach, Karl Philipp Emanuel, German musician: b. Weimar, 14 March 1714; d. 14 Dec. 1788. He was the son of Johann Sebastian Bach and was court musician in the service of Frederick the Great in 1740-67. He wrote on the theory of piano playing and was a voluminous composer of piano music, oratorios, etc.

Bacharach, bān'a-rah, a town of Germany, situated on the Rhine, 12 miles south of Coblenz. The vicinity produces excellent wine, which was once highly esteemed. The view from the ruins of the castle is one of the sublimest on the Rhine. Pop. (1900) 1,904.

Bache, bāch, Alexander Dallas, American scientist: b. Philadelphia, Pa., 19 July 1806; d. 17 Feb. 1867. He was graduated from the United States Military Academy, at the head of his class, in 1825; became professor of natural philosophy and chemistry at the University of Pennsylvania in 1828; was the organizer and first president of Girard College, 1836, where he established a magnetical and meteorological observatory, and was appointed superintendent of the United States Coast Survey, in 1843. In the last office he performed services of lasting and invaluable character. He was regent of the Smithsonian Institution in 1846-67; an active member of the United States Sanitary Commission during the Civil War; and president of the National Academy of Sciences in 1863. Besides a long series of notable annual reports of the United States Coast Survey, he published a report on 'Education in Europe' (1839), and 'Observations at the Magnetic and Meteorological Observatory at the Girard College' (3 vols. 1840-47).

Bache, Benjamin Franklin, American surgeon: b. 1801; d. 1881. He was great grandson of Benjamin Franklin. He established a laboratory in New York which during the Civil War was of great service to the Federal army.

Bache, Franklin, American chemist: b. Philadelphia, 25 Oct. 1792; d. 19 March 1864. He was appointed professor of chemistry at the Philadelphia College of Pharmacy in 1831, and at the Jefferson Medical College in 1841. He published 'System of Chemistry for Students of Medicine' (1819), and was one of the authors of Wood & Bache's 'Dispensatory of the United States' (1833).

Bache, George M., American naval officer: b. in the District of Columbia, 12 Nov. 1840; d. 11 Feb. 1896. He was graduated at the United States Naval Academy, in 1860, and commanded the ironclad Cincinnati in the various engagements on the Mississippi River, until she was sunk by the Vicksburg batteries, 27 May 1863. He was highly commended by Admiral Porter, Gen. Sherman, and Secretary Welles for his conduct in the last engagement. Subsequently, he took part in both attacks on Fort Fisher, and, in the second one, 15 Jan. 1865;

led the naval assault on the fort. He was retired with the rank of commander, 5 April 1875.

Bache, Hartman, American military engineer: b. Philadelphia, Pa., 3 Sept. 1798; d. 8 Oct. 1872. He entered the United States Topographical Corps; and for 47 years was constantly employed on surveys and on works of hydrographic and civil engineering. On 13 March 1865 was appointed brigadier-general, and 7 March 1867 was retired. His most notable achievements were the building of the Delaware breakwater and the application of iron-screw piles for the foundation of lighthouses upon sandy shoals and coral reefs. He retired from active service, 1867.

Bache, Sarah, American philanthropist: b. Philadelphia, Pa., 11 Sept. 1744; d. 5 Oct. 1808. She was the only daughter of Benjamin Franklin, and the wife of Richard Bache. During the Revolutionary War she organized and became chief of a band of patriotic ladies who made clothing for the soldiers, and in other ways relieved their sufferings, especially during the severe winter of 1780.

Bachelder, Nahum Josiah, American statesman; b. Andover, N. H., 3 Sept. 1854. Educated at Franklin Academy, Taunton Hill School, Andover; and became prominent farmer. Was nominated by the Republicans and elected governor of New Hampshire in 1902.

Bach'eller, Addison Irving, American novelist: b. Pierpont, N. Y., 26 Sept. 1859. He was graduated at St. Lawrence University and became a reporter of the Brooklyn Times. Subsequently he established a newspaper syndicate. His novels are 'The Master of Silence' (1890); 'The Still House of O'Darrow' (1894); 'The Unbidden Guest,' 'Eben Holden' (1900); 'D'ri and I' (1901); and 'Darrel of the Blessed Isles.'

Bach'elor, a term anciently applied to a person in the first or probationary stage of knighthood who had not yet raised his standard in the field. A knight bachelor is one who has been raised to the dignity of a knight without being made a member of any of the orders of chivalry such as the Garter or the Thistle. It also denotes a person who has taken the first degree in the liberal arts and sciences, or in divinity, law, or medicine, at a college, or university; or a man of any age who has not been married, the most usual meaning of the term. In ancient times unmarried men were subject in some countries to severe penalties for remaining celibates and in modern days the proposition to tax bachelors has been seriously discussed in several nations.

Bach'elor, a local name in the Mississippi valley for the small bass, more usually called crappie (q.v.).

Bachelor's Button, the double yellow buttercup (*Ranunculus acris*). Similar forms, as *R. acutifolius*, are often called white bachelor's buttons. The name is also given to *Centaurea cyanus* (see CORNFLOWER) and to *Gomphrena globosa*.

Bachian, bāch-yān', one of the Molucca Islands, immediately south of the equator, and southwest of Gilolo; area, 800 square miles. It is ruled by a native sultan under the Dutch.

BACHMAN—BACKUS

Bachman, bāk'man, **John**, American clergyman and naturalist: b. Dutchess County, N. Y., 4 Feb. 1790; d. 25 Feb. 1874. He became pastor of a Lutheran church in Charleston, S. C., and published among other works, 'Characteristics of Genera and Species as Applicable to the Doctrine of the Unity of the Human Race' (1854). He is best known by reason of his association with Audubon in the making of the 'Quadrupeds of North America,' he writing the principal part of the text, which Audubon and his sons illustrated.

Bachmut, bāch-moot', a town of southern Russia, in the government of Ekaterinoslav, with a trade in cattle and tallow. It has coal mines and salt wells, and soda is extensively manufactured. The salt produced here is of a very high grade of excellence. Pop. (1897) 19,400.

Bacil'lus. See BACTERIA.

Back, Sir **George**, English explorer: b. Stockport, 6 Nov. 1796; d. London, 23 June 1878. He entered the British navy in 1808, and in 1817 was in the expedition to Spitzbergen. He accompanied Sir John Franklin to the Arctic regions in 1819 and again in 1825, and in 1833 led a party in search of Sir John Ross, then in the Arctic Ocean, and in 1836, in command of the *Terror*, made his last trip to the north. The Geographical Society awarded him a gold medal in 1837, and in 1839 he was knighted. He became admiral in 1867. Among his works are 'A Narrative of the Arctic Land Expedition' (1836); a 'Narrative of the Expedition in Her Majesty's Ship *Terror*' (1838).

Back Bay, a fashionable residential district in Boston, made by filling in an enlargement of the Charles River, formerly called the Back Bay. See BOSTON.

Back Land, name applied to the region around the Arctic Circle, in British North America. It was explored by Capt. Back in 1831.

Back-Staff, an instrument invented by Capt. Davies, about A.D. 1590, for taking the altitude of the sun at sea. It consisted of two concentric arcs and three vanes. The arc of the longer radius was 30°, and that of the shorter one 60°; thus both together constituted 90°. It is now obsolete, being superseded by the quadrant.

Backbite, Sir **Benjamin**, an evil-minded, sharp-tongued character in Sheridan's comedy, 'School for Scandal.'

Backgammon is a game in which two opposing players move symbolic men into or out of each other's territory on a board, according as they are respectively entitled to do so by the throw of a dice. Without question a game of that nature was played among the Aztecs of Mexico centuries before the landing of Cortez, and it is probable that it was brought from Asia to the Pacific coast by the original immigrants. Francisco Lopez de Gomara described it in 1552, and Joan de Torquemada in 1616 gave additional details of the game, mentioning that the little stones of each contestant varied in color. The Iroquois Indians had a dice game of a somewhat similar sort.

Modern backgammon is played by two players who have between them a board, each side of which has alternate black and white angular

marks projecting like rays from the rim. Each player has 15 flat tablets (similar to those with which drafts is played) called men. One player's men are black, the others are white. Each player has a dice box for his own use but the two dice are used alternately by them both. Each dice has a number on each face numbered from one spot to six. Each player throws the dice in turn on to the centre of the board: and moves two men, one man according to the distance indicated by one of the dice and the other according to the number on the second dice. So the game proceeds in the usual manner, the players throwing and moving their men alternately into and out of each other's territory, until one player has carried all the men from the opposite home (or inner table) into the outer table: and thence into his own outer table and finally into his own home or inner table. The simplest text-book on the subject is that of A. Howard Cady.

Backhuysen, bak'hoi-zen, or **Bakhuysen**, **Ludolf**, celebrated painter of the Dutch school, particularly in sea pieces: b. Emden 18 Dec. 1631; d. 1709. His most famous picture is a sea piece which the burgomasters of Amsterdam commissioned him to paint as a present to Louis XVI., and which is still at Paris.

Bäckström, bēk'strēm, **Per Johan Edvard**, Swedish dramatist and lyric poet: b. Stockholm, 27 Oct. 1841; d. 13 Feb. 1886. His principal work is 'Dagvard Frey' (1876), a tragedy; besides this, the dramas 'A Crown' (1869); 'Eva's Sisters' (1869), and 'The Prisoner of Kallö' (1870), met with success. His lyrics were published in three collections (1860, 1870, 1876).

Back'us, **Azil**, first president of Hamilton College, Clinton, N. Y.: b. Norwich, Conn., 13 Oct. 1765; d. 9 Dec. 1817. After graduating at Yale in 1787, he served the Church at Bethlehem, Conn., until he became president of Hamilton College in 1812.

Back'us, **Isaac**, Baptist clergyman and author: b. Norwich, Conn., 9 Jan. 1724; d. 20 Nov. 1806. He was ordained 13 April 1748 and became pastor of a Congregational church in Middleborough, Mass. Some of his congregation sympathizing with the Baptists he united with them and formed a Baptist church in 1756. Throughout his life he was a persistent advocate of the widest religious freedom, holding open communion for many years. For 34 years he was a trustee of the present Brown University, then Rhode Island College. As a delegate to the convention that adopted the Federal constitution, he voted in its favor. Of his numerous writings the most important is 'A History of New England with Special Reference to the Baptists' (3 vols. 1777-96; new ed. by D. Weston, 2 vols. 1871), a partisan but valuable work. His 'History of Middleborough' is in Massachusetts Historical Society Collections (Vol. III., 1st Series, 1794; repr. 1810).

Back'us, **Truman Jay**, American educator: b. Milan, N. Y., 11 Feb. 1842; was graduated at the University of Rochester in 1864; was professor of English literature at Vassar College, 1867-83; then became president of the Packer Collegiate Institute in Brooklyn, N. Y. After going to Brooklyn, he served on

BACON

several state commissions. His publications include 'Great English Writers,' 'Outlines of English Literature,' and a revised edition of Shaw's 'History of English Literature.'

Bacon, Alice Mitchell, American educator: b. New Haven, Conn., 26 Feb. 1858; was educated privately and took the Harvard examinations in 1881; taught at the Hampton Normal and Agricultural Institute in 1883-8, and in Tokio, Japan, in 1888-9; returned to the Hampton Institute in 1889, and founded the Dixie Hospital for training colored nurses in 1890. In 1900 she again began teaching in Tokio. She published 'Japanese Girls and Women,' 'Japanese Interior,' etc.

Bacon, Augustus Octavius, American legislator: b. Bryan County, Ga., 20 Oct. 1839. He was graduated from the University of Georgia in 1859, from the law department of the university in 1860; entered the army of the Confederate States at the beginning of the Civil War, and was adjutant of the 9th Georgia regiment in the Army of Northern Virginia, and later promoted captain and assigned to general staff duty; and in 1866 began the practice of law at Macon, Ga. In 1880 he was president of the State Democratic convention, and in 1884 a delegate from the State at large to the national Democratic convention. He was a member of the Georgia house of representatives in 1871-82, 1892, and 1893, and for the greater part of the time its speaker. Elected to the United States Senate in November 1894, he was re-elected in 1900.

Bacon Benjamin Wisner, American educator: b. Litchfield, Conn., 15 Jan. 1860; studied in Germany and Switzerland, and was graduated at Yale College in 1881; held several Congregational pastorates; and in 1896 became professor of New Testament criticism and exegesis in Yale University. Author of 'Genesis of Genesis'; 'Triple Tradition of the Exodus'; and 'Introduction to the New Testament'.

Bacon, Delia Salter, American author: b. Tallmadge, O., 2 Feb. 1811; d. 2 Sept. 1859. She was eminent in her day as a teacher, and wrote several stories, but is now remembered only as an eloquent advocate of the theory that the plays of Shakespeare were written by Lord Bacon. She herself did not originate the idea, but was the first to give it any currency, in her 'Philosophy of the Plays of Shakespeare Unfolded' (1857). The book had the honor of a preface from the pen of Nathaniel Hawthorne, and the theory has been accepted by a few persons in both England and the United States, who have wasted not a little ingenious reasoning in its advocacy.

Bacon, Edwin Munroe, American author: b. Providence, R. I., 20 Oct. 1844. He received an academical education; was on the staff of several Boston papers; and wrote 'King's Handbook of Boston'; 'Boston Illustrated'; 'Historic Pilgrimages in New England'; 'Literary Pilgrimages in New England'; and 'Boston of To-day.'

Bacon, Francis (VISCOUNT ST. ALBANS), English philosopher: b. 1561; d. 9 April 1626; son of Sir Nicholas Bacon, lord keeper of the Great Seal. He entered Cambridge when in his 13th year, and in his 16th year wrote against the Aristotelian philosophy. It was then the cus-

tom in England to send abroad, particularly to France, those young men who were destined for public life, hence Bacon went to Paris in the suite of Sir Amias Paulet, who soon after sent him to England with an important message. He discharged it to the satisfaction of the queen (Elizabeth), returned to France, and traveled through several provinces of that country to study its manners and laws. The death of his father, in 1579, called him back to England where, in order to be enabled to live suitably to his rank, he devoted himself to jurisprudence, and was so successful in this profession that he was made counsel extraordinary to the queen before he was 28 years old. In 1584 he was sent to Parliament as member for Melcombe Regis, in 1586 he sat for Taunton. About 1591 he became a friend of the Earl of Essex, and when disappointed in not being made attorney-general the latter presented him with an estate in land. Bacon, however, soon forgot his obligations to his generous benefactor, and not only abandoned him, when he fell into disgrace, but even took active part in prosecuting him. Against this ingratitude the public voice was raised, and whatever Bacon might say in his justification, he remained at court the object of hatred to one party and of jealousy to the other, and the queen did not appear inclined to do anything in his favor. In Parliament he conducted himself at first for some time with dignity and independence, and voted with the popular party against the measures of the ministers, though he continued in the service of the Crown. But toward the end of Elizabeth's reign his parliamentary conduct became more servile. For this he may be excused on account of his poverty, which was so great that he was twice arrested for debt. The reign of James I. was more favorable to him. This prince, who was ambitious of being considered a patron of letters, conferred upon him in 1603 the order of knighthood. Having been commissioned to make a representation of the oppressions committed by the royal purveyors in the king's name, he executed the task with so much success as to satisfy both the king and the Parliament. The House of Commons voted him the public thanks, and James made him one of the king's counsel, with a pension of £40, which was soon followed by another of £60. His situation now continually improved; he contracted an advantageous marriage; was made solicitor-general and then attorney-general; in 1617 became lord keeper of the seals; in 1618 was made lord high chancellor and created Baron of Verulam, and in 1621 Viscount St. Albans. He might now have lived with splendor without degrading his character by those acts which have stained his reputation. Nevertheless, great complaints were made against him. He was accused before the House of Lords of having received money for grants of offices and privileges under the seal of state. He was unable to justify himself, and, desiring to avoid the mortification of a trial, confessed his crimes and threw himself on the mercy of the peers, beseeching them to limit his punishment to the loss of the high office which he had dishonored. After he had acknowledged by an explicit confession the truth of almost all the charges, notwithstanding the intercession of the king, and the interest which they themselves took in one of their most distinguished members, the lords sentenced him to pay a fine

BACON

of £40,000, and to be imprisoned in the Tower during the pleasure of the king. He was also declared forever incapable of place or employment, and forbidden to sit in Parliament or to appear within the verge of the court. His sentence was not rigorously executed; he was soon released from the Tower, and the rest of his punishment was by degrees remitted entirely.

All the studies and efforts of this great man aimed at a reform in the system of human knowledge. He examined the whole circle of the sciences, investigated their relations, and attempted to arrange them according to the different faculties of the human mind to which each belongs. In this, however, he could not succeed for want of a well-founded and natural division of the powers of the mind; for he divided the sciences into those of the memory, of the understanding, and of the imagination. This he explains in his 'Instauratio Magna,' under the head *De Dignitate et Augmentis Scientiarum*. He further perceived that, in all the branches of natural science, the only way to truth is by the observation of nature. How this observation is to be directed, and how nature is to be examined, is illustrated in several places. His universal genius had attended to all the sciences; he perceived to what point each of them had advanced, what false directions they had taken, and how they were to be brought back to truth. As a metaphysician he displays no less penetration than profoundness in his views of the operations of the mind, of the association of ideas, and of the prejudices which surround us from our cradle, and prevent the free exercise of reason. As a natural philosopher he brought forward very ingenious views, and was on the route to several important discoveries. He invented a kind of pneumatic machine, by his experiments with which he was led to suspect the elasticity and gravity of the air, which Galileo and Torricelli afterward discovered. He apparently had a glimpse of the law of gravitation, which Newton afterward proved. He wanted only experiments in order to demonstrate the principles of this power. He treated also of natural history, but only in a brief manner, in his work, '*Sylva Sylvarum*,' etc. He wrote treatises dealing with medical subjects; among others, one on life and death. But physiology and chemistry were then so imperfectly understood, that he could not avoid falling into great errors. The science of law he treated not merely as a lawyer, but as a legislator and philosopher. His aphorisms are not less remarkable for profound views than for vigor and precision of expression. Morals are the subject of one of his finest works, entitled '*Essays or Sermones Fideles*'—showing the most profound knowledge of man and of human relations, and written in an eloquent and vigorous style. As an historian he is less distinguished, though his history of Henry VII. possesses solid merits. Of his knowledge of antiquity his work '*On the Wisdom of the Ancients*' bears witness, in which he explains the ancient fables by ingenious allegories. He possessed a less profound knowledge of mathematics, and to this it is to be ascribed that he opposed the Copernican system. In this point alone he remained behind some enlightened men of his time. In other departments of human investigation he soared to such a height, that his contemporaries could not fully estimate the extent of his genius, the justness of his views,

and the importance of his labors. An edition of his works was prepared by Spedding, Ellis, and Heath (1857-74, 14 vols; 7 containing 'Life and Letters' by Spedding); also an edition of selections from his works was published in New York (1877). Dr. E. A. Abbott's 'Francis Bacon' (1885) is a valuable account of his life and works; and Dean Church's 'Life of Bacon' (in the 'Men of Letters' series) is also valuable, more especially as a corrective to Macaulay's misleading essay. A valuable exposition of his philosophy is given in Kuno Fischer's 'Francis Bacon of Verulam' (1857).

Ba'con, Henry, American painter: b. Haverhill, Mass., 1839. He served in the Civil War, studied art in Paris under Cabanel and Edward Frere, and painted, among others, 'Boston Boys and Gen. Gage' (1875); 'Paying the Scot' (1870), and 'The Farewells' (1878).

Ba'con, John, English sculptor: b. Southwark, 24 Nov. 1740; d. 4 Aug. 1799. In early life he was employed in modelling small porcelain ornaments, and while yet an apprentice he formed a project for making statues of artificial stone, which was afterward perfected and carried into effect in a manufactory in the New Road. About 1763 he began to work in marble; and shortly afterward, invented an instrument for transferring the form of the model to the marble. In 1768 he became a student of the Royal Academy, and next year he obtained the first gold medal for sculpture given by that society, the following year he was chosen an associate, and in 1778 was made a full member. His chief works are two groups for the interior of the Royal Academy, the statue of Judge Blackstone for All Souls' College, Oxford; another of Henry VI. for Eton College; the monument of Lord Chatham in Westminster Abbey; and the statues of Dr. Johnson and the philanthropist Howard in St. Paul's Cathedral. **JOHN**, his son: b. 1777; d. 1859; became a distinguished sculptor, and executed various works still to be seen in St. Paul's and Westminster Abbey.

Ba'con, John Edmund, lawyer: b. Edgefield, S. C., 3 March 1832; d. Columbia, S. C., 19 Feb. 1897. Graduated at South Carolina College, 1851; Litchfield (Conn.) Law School, and admitted to the bar, 1854. He was secretary of the United States legation at St. Petersburg, and married a daughter of ex-Gov. Pickens, then minister to Russia. He resigned in 1860, entered the Confederate army, and rose to the rank of major. He was one of the negotiators for the restoration of South Carolina to the Union, 1866; and to him was chiefly due the reopening of South Carolina College by act of the legislature in 1873. In 1886 he was appointed United States chargé d'affaires in Uruguay and Paraguay.

Ba'con, John Mosby, American military officer: b. Kentucky, 17 April 1844; served in the Union army through the Civil War; was appointed captain in the 9th United States Cavalry, in 1866, and colonel of the 8th cavalry in 1897. On 4 May 1898, he was appointed brigadier-general of volunteers and placed in command of the Department of Dakota. In October of that year he put down the outbreak of the Pillager band of the Chippewa Indians in Cass County, Minn. Subsequently, he was assigned to duty in Cuba, with headquarters at Neuvas, till 8 May 1899, when he was retired.

FRANCIS BACON.

BACON

Ba'con, Leonard, American clergyman: b. Detroit, Mich., 19 Feb. 1802; d. 24 Dec. 1881; graduated at Yale in 1820, after which he studied theology at Andover, Mass. In 1825 he became pastor of the First Congregational Church in New Haven, a post which he held officially, though not always actively, until his death. He was professor of didactic theology in Yale (1866-71). He was throughout his life an active opponent of slavery. In 1847 he joined with Drs Storrs and Thompson to found the *New York Independent*, in the joint editorship of which he continued for 16 years. Besides a vast number of reviews and pamphlets, he published 'Views and Reviews' (1840); 'Slavery Discussed in Occasional Essays' (1846); and 'Genesis of the New England Churches.'

Ba'con, Nathaniel, American insurrectionary leader: b. Friston Hall, Suffolk, England, 2 Jan. 1647; d. 26 Oct. 1676. His great-grandfather was cousin to Lord Bacon; his mother, a Brooke, was daughter of a Suffolk knight. He entered St Catherine's College, Cambridge, in 1660; took M.A. 1667; studied law at Gray's Inn, London, and traveled on the Continent. He found life too straitened in England on the income his father allowed him, and the latter gave him £1,800 outright to emigrate to Virginia, where his cousin, Nicholas Bacon, had been living since 1650. He arrived in the latter part of 1673 with a young wife, daughter of Sir Edward Duke, and soon became a member of the governor's council, as was his cousin; and settled on a plantation some 20 miles below Richmond, on the James, called "Curle's Wharf." He also had another on a part of the site of Richmond, the attack on which by the Indians was part of the raid that brought on the imbroglio known as "Bacon's Rebellion," which see for his further career and fate.

Ba'con, Roger, English monk and philosopher. b. near Ilchester, about 1214; d. 1294. He first entered the University of Oxford, and afterward went to that of Paris, where he seems to have distinguished himself much by successful study and teaching, and received the degree of doctor of theology. About 1250 he returned to England, where he entered the order of Franciscans, fixed his abode at Oxford, and devoted himself to his studies, chiefly in natural philosophy. Means were furnished him by generous friends of science, whose contributions enabled him to purchase books, to prepare instruments, and to make the necessary experiments. In examining the secrets of nature he made discoveries and deduced results which appeared so extraordinary to the ignorant, that they were believed to be works of magic. The Franciscan order denounced to the court of Rome his dangerous opinions and astonishing operations, with the result that in 1257 he was sent to Paris, where he was kept in confinement for no less than 10 years. In 1267, Clement demanded a general exposition of his scientific views; upon which Bacon wrote a work under the title of 'Opus Majus,' giving a connected view of the different branches of human knowledge, supplemented soon after by two other works—'Opus Secundum' and 'Opus Tertium' (all of which, as well as certain others of his writings, have been printed). Under Clement's successor, Nicholas III., the general of

the Franciscans, Jerome of Ascoli, declared himself against Bacon, forbade the reading of his writings, and issued an order for his imprisonment, which was confirmed by the Pope. This new confinement lasted 10 years; and when Jerome of Ascoli was elected pope, under the name of Nicholas IV., Bacon vainly endeavored to convince him of the innocence and utility of his labors, by sending him a treatise 'On the Means of Avoiding the Infirmities of Old Age.' After the death of Nicholas IV. he regained his liberty, and returned to Oxford, where he wrote a 'Compendium of Theology.'

Though an extraordinary man, Bacon could not entirely free himself from the prejudices of his time. He believed in the philosopher's stone and in astrology. There are to be found in his writings new and ingenious views on optics; for example, on the refraction of light, on the apparent magnitude of objects, on the magnified appearance of the sun and moon when in the horizon, etc. He describes very exactly the nature and effects of convex and concave lenses, and speaks of their application to the purposes of reading, and of viewing distant objects, both terrestrial and celestial; and it is easy to prove from his writings that he was either the inventor or improver of the telescope. He also gives descriptions of the *camera obscura*, and of the burning-glass. He made, too, several medical discoveries. The discovery of gunpowder has been attributed to him. His writings contain the chemical formula for it, but it is generally supposed that he obtained it from the Arabs, from whose writings he derived other suggestions. He was acquainted with geography and astronomy, discovered the errors of the calendar and their causes, and made a corrected calendar. In moral philosophy also, Bacon laid down some excellent precepts.

Ba'con, Roger, his Opus Majus (1267 A.D.). Newly edited and published, with introduction and full English analysis of the Latin text, by J. H. Bridges (2 vols. 1897). An adequate publication, after 630 years, of one of the most remarkable productions of the human mind.

The work is an exhortation addressed to Pope Clement, urging him to initiate a reform of Christian education, in order to establish the ascendancy of the Roman Catholic Church over all nations and religions of the world. Its central theme was the consolidation of the Roman Catholic faith as the supreme agency for the civilization of mankind. Its author wished to see recognition of "all the sciences," since all are parts of one and the same complete wisdom. He first gave experiment the distinct and supreme place which was later revived by Descartes, and carried out in modern science. He formed a clear conception of chemistry, in his day not yet separated from alchemy; and of a science of living things, as resulting with chemistry from physics. In the part of his work dealing with moral philosophy, Bacon makes the first attempt ever made at the comparative study of the religions of the world. His protests against the intellectual prejudices of the time, his forecasts of an age of industry and invention, the prominence given to experiment, alike as the test of received opinion and the guide to new fields of discovery, render compari-

BACON — BACON'S REBELLION

son with Francis Bacon unavoidable. In wealth of words, in brilliancy of imagination, Francis Bacon was immeasurably his superior. But Roger Bacon had the sounder estimate and the firmer grasp of that combination of deductive with inductive method which marks the scientific discoverer.

Ba'con, Thomas Scott, American theological writer: b. Saratoga, N. Y., 1 Feb. 1825. Originally a lawyer, he became an Episcopal clergyman (1854). Besides sermons, addresses, reviews, etc., he has written 'Both Sides of the Controversy Between the Roman and the Reformed Church' (1858); 'The Reign of God, not the Reign of Law' (1879); 'The Beginnings of Religion' (1887); 'Primitive and Catholic Doctrine as to Holy Scripture'; 'It is Written.'

Ba'con, Philippine Islands, a town in the province of Albay, Island of Luzon. Pop. about 13,000.

Ba'con, the name given the sides of a pig which have been cured or preserved by salting with salt and saltpetre, and afterward drying with or without wood smoke. By the old process of rubbing in the saline mixture, the curing occupied from three to four months. The method now adopted on a larger scale is to place the prepared flitches in a fluid pickle. The pickling, drying, and smoking now occupy not more than six weeks. Bacon may be called the poor as well as the rich man's food. By the former it is prized as a necessary of life; by the latter, for its exquisite flavor. The nitrogenous, or flesh-forming matter in bacon is small, one pound yielding less than one ounce of dry, muscular substance, while the amount of carbon compounds, or heat givers, is large, exceeding 60 per cent. Its digestibility, however, owing to the large proportion of fat it contains, is not less than that of beef or mutton.

Ba'con Bee'tle (*Dermestes lardarius*), an insect, the larva of which destroys bacon, lard, and furs.

Baconian Philos'ophy, the inductive philosophy of which it is sometimes said that Lord Bacon was the founder. This, however, is an exaggerated statement. What Lord Bacon did for this mode of ratiocination was to elucidate and systematize it; to point out its great value, and to bring it prominently before men's notice; lending it the support of his great name at a time when most of his contemporaries were satisfied with the barren logic of the schools. The triumphs of modern science have arisen from a resolute adherence on the part of its votaries to the Baconian method of inquiry.

Ba'con's Rebel'ion, in Virginia, 1676. The English Navigation Acts of 1651 and 1660, restricting colonial trade to English vessels, had produced universal distress in Virginia, forcing it to buy and sell to the home monopolists at their own price; tobacco, not only the chief product, but the chief currency, became almost worthless. In 1667 the smaller landholders were reported on the brink of rebellion, and in 1673 there were meetings to refuse payment of taxes. Meantime the corrupt civil service of the colony, place-hunters sent over by Charles II. to be rid of them, were plundering the planters by means of the export dues, in collusion with the governor, Sir William Berkeley

(q.v.); and the latter was fattening on a fur trade with the Indians. To save himself from the opposition or criticism of the masses, whom he hated and despised, and perpetuate the oligarchy of the small group of rich planters who formed his council, he kept his legislature of 1662,—strongly royalist from the enthusiasm of the Restoration,—in office till 1676 by annual adjournments without new elections; he had also abolished universal suffrage and substituted a property qualification. This built up a strong opposition, including some of the solidest citizens. In 1675 a terrible Indian war broke out, wrapping the frontier in fire and blood; 36 whites were murdered in one day of January 1676. Berkeley, implored to protect the settlements, ordered out a force under Sir Henry Chicheley, then suddenly dissolved it, recalled Chicheley's commission, and refused to do anything more till the Assembly met in March. The result was frightful: within 17 days 60 of the 71 plantations in Rappahannock parish were destroyed, and by the time of the March meeting, over 300 victims had perished, a large part by fiendish tortures. Even then, under Berkeley's orders, the "Long Assembly" (so called in allusion to the Long Parliament) merely committed another outrage: instead of authorizing an army, they authorized frontier forts, to have a garrison of 500 soldiers (from the sea-board counties, not the frontier one which suffered from the Indians, and hated the governor). No attack on the Indians was to be permitted except under specific orders from the governor. Two million pounds of tobacco more were added to their taxes for this mockery of protection, and most of that was embezzled and the forts built so as to be worthless, even for the little service they could do. The people petitioned for leave to form expeditions at their own charge under any leader Berkeley might appoint; he forbade any further petitions of the sort under heavy penalties. It was the universal belief that his one solicitude was to save his Indian trade monopoly from harm. Finally the people of Charles City County petitioned once more for leave, in face of actual ravages then going on; and once more the obstinate and avaricious old man refused it. Men could bear no more; they raised 300 volunteers on their own risk, and by acclamation placed at their head Nathaniel Bacon (q.v.), a planter of 29, recently from England, and one of the governor's council. He accepted it and wrote to Berkeley for a commission; Berkeley returned an evasive answer, and Bacon started on his expedition without it. Berkeley hearing of it, sent an order for the company to disperse; all but a few, however, kept on and dispersed the Indians. Berkeley collected a troop of horsemen, and set out to arrest Bacon, when he heard that the colony was all in revolt behind him; and he hurried back to Jamestown, dissolved his 14-year-old Assembly, and issued writs for a new one. Despite his suffrage restriction, there was a heavy majority against him; Bacon being one of the new members. As the latter approached Jamestown, he was arrested and brought before Berkeley, who, in view of the uprising, did not dare proceed to extremities, but paroled him, and on Bacon's making submission for attacking the Indians without license allowed him to take his seat, with a tacit agreement to give him his commission to finish

BACCOOR—BACTERIA

the Indian war. The new legislature, besides restoring universal suffrage and making other reforms very distasteful to Berkeley, provided for raising an army of 1,000 men for Indian service. But Bacon, still refused the commission, and privately warned that his life was in danger, fled, shortly returned with 600 men, and forced Berkeley to sign his commission as major-general for the Indian campaign, and also a memorial to the king in his favor and reciting the colonial grievances. This later was sent off with a secret note from Berkeley, disavowing it. Bacon within a month had nearly put down the Indian outbreak, especially by a crushing victory at Bloody Run (near Richmond), when he heard that the governor had proclaimed him and his party rebels, and to escape popular wrath had fled across the peninsula to Accomac. Bacon marched back to Middle Plantation (the site of Williamsburg), launched a manifesto against Berkeley, and drew around him a gathering of some prominent men and a vast number of penniless ones (for the movement was largely a democratic revolt against an overweening aristocracy). They agreed to stand by him even against a royal army; feeling that they were compromised beyond retreat at best, and hoping to hold out till the king could be correctly informed and pardon them. Bacon carried on the Indian campaign till September, thoroughly stamping out the danger to the colony; meantime sending an expedition to capture Berkeley, which was itself captured. Berkeley gathered about 1,000 militia by promising them the confiscated estates of the rebels, and reoccupied Jamestown; Bacon marched against him, drove him to Accomac once more, and burnt Jamestown to the ground. But he had taken malaria there, and while invading Gloucester County to attack Major Brent, was stricken down, and died 1 October. The rebellion at once collapsed, and Berkeley wreaked a frightful vengeance upon Bacon's adherents. See *BERKELEY*, SIR WILLIAM. For authorities, besides new documents published in 'Virginia Magazine of History' (1893-8), see the 'Century Magazine,' Vol. XL, under "Nathaniel Bacon," by Edward Eggleston; and John Fiske's "Old Virginia and Her Neighbors," 1897, Vol. II).

Bacoor, ba'kō-ōr', Philippine Islands, a town of the province of Cavite, on the Island of Luzon. Pop. about 14,000.

Bacsanyi, bō'chān-ye, **Janos**, Hungarian poet: b. Tapolcza, 11 May 1763; d. 12 May 1845. His first work, published in 1785, procured him an appointment in a public office, but a liberal poem cost him this in 1793, as well as his liberty the year after. In 1796 he went to Vienna, and there he married a few years later the German poet, Gabrielle Baumgarten—an unhappy match. In 1809, Bacsanyi translated Napoleon's proclamation to the Hungarians, and was afterward obliged to take refuge in Paris. After the Peace of Paris, he lived at Linz, where he died. His collected poems appeared at Budapest in 1827.

Bacteræ'mia, a form of poisoning due to bacterial products. This poisoning is usually due to the absorption of toxins from bacteria situated either on the surface of the body, the intestinal canal, or in some confined space. See *PYÆMIA*.

Bacteria. Literally the word *bacterium*, bacteria being its plural, means a tiny rod or stick. As understood, however, by biologists, bacteria constitute a genus of lowly organized microscopic plants having forms other than that indicated by the literal meaning of the word. Briefly defined, bacteria are unicellular vegetables that multiply by the simple process of transverse division—they are, therefore, schizomycetes. In size they are all of microscopic dimensions requiring in most cases to be magnified from 600 to 1,000 diameters before becoming visible and even then they appear in many instances as scarcely more than tiny points. As encountered in nature they assume a variety of forms which may be conveniently arranged into three principal groups, namely: the spherical, the rod-like, and the spiral. To the spherical forms the name *cocci* or *micrococci* (*coccus*, singular) is given, and, according to the manner in which these tiny spheres develop and their progeny adhere to one another, they are further severally designated as *staphylococci*, that is, cocci clustering irregularly together like grapes in a bunch; *streptococci*, that is, cocci adhering together like beads or pearls in a strand; *diplo-cocci*, that is, cocci occurring in pairs; *tetracocci*, that is, cocci clustered in fours, etc.

To the rod-like group—that is, those which are straight, having one diameter longer than another—the designation *bacilli* (*bacillus*, singular) is given. While the structure and mode of multiplication of many of the bacilli is as simple as is that of the micrococci—that is, one cell divides into two, two into four, and so on *ad infinitum*, without variation, it is nevertheless in the group of bacilli that we encounter a number of species provided by nature with a more highly organized and complicated means for propagation and perpetuation. It is here that we encounter species in the course of whose life cycle there develops within each rod a single tiny, oval, highly resistant body, a spore as it is called, which may be fairly compared to the seeds of higher plants and which, like the seed, may be gathered and kept for almost indefinite periods, without losing their power of germination. Since such spores of bacteria are markedly tenacious of life even under the most unfavorable of circumstances it is obvious that the power to form spores is an important provision for the preservation of the species. It is of passing interest to know that the ability to form spores is possessed by some, but not all, of the disease-producing bacteria, a fact that serves to explain in part the difficulties experienced by the sanitarian in eliminating certain types of infection. For it must be remembered that the infective species capable of entering the spore stage are by virtue of that property much less vulnerable to the action of disinfectants and disinfecting processes than are the species not so endowed.

The spiral forms, *spirilla*, *spirochaeta*, as they are called, comprise those bacteria having one or more curves in their long axis, that is, those that are twisted like a corkscrew. They are sometimes seen as homogeneous, long spiral threads without segmentations, while again they may consist of short curved segments adhering end to end. Spore formation is not a characteristic of the spiral bacteria.

In structure bacteria are non-nucleated masses of protoplasm surrounded by an en-

BACTERIA

veloping zone appearing in some instances to be but a condensation of the central protoplasm, while in others it partakes somewhat of the nature of mucin. Many of the bacteria exhibit no evidence of independent motility, while others, by virtue of special locomotive apparatus (*flagella*) move themselves about in fluids in a most energetic manner. As their structure is exceedingly simple, in so far as formed elements are concerned, their mode of nutrition is, physically speaking, correspondingly simple—that is, the nourishment is absorbed and their waste products discharged directly through their enveloping membranes by the process of osmosis. This being the case it is obvious that bacteria can multiply and perform their physiological functions only under conditions of moisture. Unlike the more highly organized plants bacteria are apparently without special provisions for gaseous exchange, that is, they are devoid of chlorophyl. They obtain their oxygen as such from the free air or from easily decomposable oxygen compounds. In the course of his early investigations in this field Pasteur discovered a group of bacteria that have ever proven to be of the greatest interest—a group that, paradoxical as it may seem, not only does not require free oxygen for its life processes but to the growth of which free oxygen is actually prohibitive. To these species he gave the designation *anaerobic* to distinguish them from the majority, the *aerobic* varieties, to which free oxygen is essential. In their relations to higher life bacteria may be regarded as allies or as enemies, according to the nature of the species under consideration. Contrary to notions that have been more or less prevalent the majority of bacteria have nothing to do with disease production. Their natural role is that of scavengers. They are concerned in nature's great laboratory, the soil, in working over dead organic matters into forms appropriate to the nourishment of growing vegetation. Since in the course of this conversion dead bodies that would otherwise encumber the earth are caused to disappear they must from both the æsthetic and economic standpoints be regarded as, in the main, benefactors. In this group of *saprophytic* bacteria, as they are called, that is, those that live on dead matters, we encounter species of the greatest interest and importance. It is here that we perceive the omnipresent forms concerned in the reduction of dead animal and vegetable tissues into such simple forms as carbon dioxide, ammonia and water to be used by higher plants. It is in this group that we find the ever-present nitrifying species—that is, those peculiar ferments that assist the leguminous plants in assimilating free atmospheric nitrogen; that oxidize the ammonium of decomposition to the nitrous and nitric acids so essential to plant life; that convert the objectionable organic matters of sewage and polluted waters into an inert inorganic form and that, through their specific activities supply, where circumstances are favorable, the entire commercial world with its supply of saltpetre.

The saprophytic group also comprehends many species used in the arts and industries—such, for instance, as those concerned in the production of certain organic acids; those employed in the manufacture of indigo by the fermentation process and in the preparation of hemp; and those utilized in the manufacture of

cheese and butter. In the study of this large group one constantly encounters other species presenting most engaging characteristics—some of these, the *chromogenic* varieties, have the property of producing during the course of their growth pigments of great beauty—brilliant reds, delicate pinks, rich purples, yellows ranging from the palest lemon to the deepest orange, are those most often encountered. In another group, the *photogenic*, we meet with species having the emission of light as their most singular peculiarity. When growing these forms glow with a peculiar phosphorescence, and it is significant to note that these luminous varieties have been most frequently encountered in the sea and upon articles from the sea. The evil odors of putrefaction are the results of saprophytic bacterial development. In the *parasitic* group of bacteria we encounter those species that exist always at the expense of a living host, either animal or vegetable, and in doing so not only appropriate materials necessary to life, but give off in return waste products that may act as direct poisons to the host. Fortunately this is a much smaller group than is the saprophytic mentioned above. In no particulars, save for their ability to exist at the expense of a living host and cause disease, are the disease-producing bacteria distinguishable from the innocent varieties. The essential difference between the disease-producing and the innocent bacterial species is that the former possess as their most striking physiological peculiarity the power of elaborating poisons, *toxins*, technically speaking, that have a direct destructive action upon the tissues of their host. In some cases the poisons may be properly regarded as secretions of the bacteria, and, under artificial conditions of cultivation, may easily be separated from the living bacteria elaborating them. This is especially true of the poisons of diphtheria and of tetanus or lock-jaw. When thus separated such poisons, entirely independent of the living bacteria, retain the specific property of causing the symptoms and many of the pathological changes that characterize the growth of the living bacteria in the tissues. In other cases the poisons cannot be so readily separated; they appear to be an integral constituent of the protoplasm of which the bacteria are composed. This is especially the case with the toxins of *bacillus typhosus*, *bacillus dysenteria*, and *spirillum cholera Asiaticæ*—the organisms concerned in the causation of typhoid fever, epidemic dysentery, and Asiatic cholera, respectively. In the case of still other pathogenic species there is little doubt that specific intoxicants are in one way or another elaborated during infection, but as yet they have not been satisfactorily demonstrated. Nevertheless, it may be said that, in general, infection by bacteria is to-day regarded as essentially a chemical phenomenon—that is, as a reaction between the poisons elaborated by the bacteria and the tissues with which they come in contact; the result of the reaction being the partial or complete death of the host in which the phenomenon is in operation.

BACTERICIDE; BACTERIOLOGY

Bactericide, any agent capable of killing bacteria. The older terms, antiseptic, germicide, etc., cover too broad a field, and the word bactericidal has come to mean something more definite and exact than the older terms. Heat is one of the best bactericidal agents. Cold is not bactericidal. Even the lowest temperatures do not destroy the life of these plants. The metallic salts and the phenols are the bactericidal agents most in use. The aldehydes, formaldehyde, benzaldehyde are also efficient. See ANTISEPTIC; GERMICIDES.

Bacteriology. Though generally considered a modern science, and perhaps properly as regards certain of its most important developmental aspects, bacteriology in reality dates from the observations of the Dutch investigator Leeuwenhoek in the latter part of the 17th century. With simple lenses ground by himself, Leeuwenhoek discovered in the mouth, in the excreta, in water, and in other matters examined by him, the presence of countless bodies of smaller dimensions than anything hitherto seen. These "animalcules," as he called them, were often observed to move themselves about in a remarkably energetic manner, and, judging from his text and illustrations, they were doubtless the bodies we now recognize as bacteria. Leeuwenhoek's observations were immediately seized upon by the philosophers of the day as offering an explanation for many hitherto unexplained phenomena. So general became the belief in a causal relation between the "animalcules" and all manner of disease conditions that for a time, we are told, there prevailed almost a "germ mania."

To the investigators of the time the question of greatest fascination in connection with this newly-discovered world was as to its origin. Many believed and stoutly maintained that the "animalcules" were the products of metamorphosis of either living or dead tissues of more highly organized beings; others that they arose *de novo* in "putrescent atmospheres"; many suspected them of spontaneous generation in some other mysterious way; while a few maintained, on experimental evidence, that they were probably the descendants of pre-existing creatures of the same kind. Singular as it may seem it took nearly two centuries to close finally that debate and to prove that the dictum of Harvey "*omne vivum ex ovo*" or better, its appropriate modification "*omne vivum ex vivo*" was as applicable to the microscopic as to the world of higher beings. In its modern aspect bacteriology dates from the epoch-making investigations especially of Koch and of Pasteur conducted during the eighth decade of the 19th century. During that period observations were made and methods of work devised that went far toward starting the subject on its career as a science. In the study of bacteria, as of all other forms of life, it is essential to a correct interpretation of form and physiological function that the observations be made upon isolated species. Prior to the period mentioned this was not possible, for the methods in vogue were insufficient for the separation of these minute creatures from one another. For the development of the science probably the most important step was, therefore, the introduction by Koch of trustworthy methods for the separation of individual bacterial species from mixtures of them, and for the more or less complete determination of their

specific morphological and physiological peculiarities; that is, for the isolation and study of bacteria in "pure cultivation," as it is technically called. Up to the time of Koch's classical research upon the methods of investigating bacteria, their study had been conducted in fluid materials, that is, in infusions of either vegetable or animal matters, in which most bacterial species develop with remarkable activity. Since many totally distinct species are indistinguishable from one another by their size, shape, and general appearance, it was obviously impossible, by the older methods of study, either to be certain if one were dealing with one or more species in the fluids in which they were growing, or to separate the one from the other in case of confusion. Koch appreciated this defect and suggested the use of solid materials as culture media, hoping thereby to reproduce the conditions so often seen when such organic matters as bread, potato, cheese, etc., become moldy on exposure to air. Here one sees the mold not always as an inextricable mixture of different species, but often as sharply isolated islands of beginning growth—as mold colonies—so to speak. These, on examination, are usually found to consist of single species, and on a slice of moistened bread one may often observe several colonies of distinct species growing side by side without, for a time at least, encroaching one upon another. By appropriate methods it is easily possible to transplant such colonies, free from admixture with other forms, and study them as "pure cultures." But such substances as bread, potato, etc., are not in general as well adapted to the study of bacteria as to that of molds. Appreciating this Koch demonstrated that the addition of gelatin to the infusions employed for the successful cultivation of bacteria converted them into practically solid culture media without robbing them of any of their useful properties; and that by the appropriate employment of such solid media it was easily possible to separate as pure cultures the individual species composing the mixtures of bacteria that one desired to analyze. Thus, for example, if a tube of gelatinized beef tea, freed from all living bacteria by heat, be gently warmed until liquefied, and be then inoculated with a mixture of several species of bacteria, growth at once begins, and if left in the test-tube progresses in about the same manner as if the beef tea did not contain gelatin; but if while still warm and fluid the contents of the tube be poured out upon a flat, cold surface, the increased area causes the bacteria to become more widely separated from one another and the lower temperature results in the solidification of the gelatin, so that each bacterium is fixed in its new position. It at once begins to germinate, and presently a "colony" results; the surface ultimately becoming studded with such colonies. As the colonies from the different species differ from one another in many ways—in outline, texture, color, effect of their growth on the gelatin, etc.—it is easily possible, after a little practice to distinguish them by the naked eye, and by transplanting them to tubes of sterile culture media to study them without the disturbing presence of other species; that is, in pure culture.

The introduction of this method for the isolation and study of bacterial species in pure cultivation certainly constitutes the most impor-

BACTERIOLOGY

tant stimulus to the development of modern bacteriology. By its results were placed upon a more secure basis than ever before, and a confidence in the work such as had never existed was awakened in the minds of all students of the subject.

The studies that had been made by Pasteur upon fermentation; upon the souring of wines; upon the maladies of silk worms, and upon certain fatal epizootics of fowls and domestic cattle; together with Koch's fundamental studies upon the infections of wounds and the appropriate methods of analyzing them were rich in suggestion to the pioneers in this new field. Within a comparatively brief period after the adoption of the new methods our knowledge of the exciting causes of many hitherto obscure diseases was greatly extended; it was shown to be possible to determine the modes of their transmission and the channels through which infection occurred. The conditions most favorable to the successful action of a host of substances employed for the purpose of disinfection were accurately determined. And early in the work observations were made that indicated the possibility of successful vaccination against disease through the use of attenuated (weakened) living cultures of specific disease-producing bacteria. One of the most important outgrowths of modern bacteriology has resulted from its application to the problems of the sanitary engineer. As a result of these studies we know that sewage, polluted waters, and polluted soils tend naturally to revert to a state of purity if their pollution be checked and that this progressive purification is due in large part to the activities of the bacteria located within them. It has been found that by the appropriate adjustment of conditions the normal activity of the bacteria may be so greatly accentuated as to constitute them the most important factors in the purification of polluted waters and sewage. The utilization of these facts is conspicuously illustrated in the purification of water by the process of natural sand filtration and in the purification of sewage by irrigation; by the septic tank process, etc. In these methods the living bacteria, and they alone, are the instruments through which the results are attained. The sand grains in the filters and the particles of soil in the irrigation fields serve only as objects to which the bacteria can attach themselves and multiply. By the normal life processes of the bacteria the polluting organic matters in the fluids to be purified are used up and inert matters given off as a result.

In the study of agricultural phenomena from the bacteriological standpoint knowledge has been equally extended. At one time it was taught that atmospheric nitrogen—representing roughly 80 per cent of the air by volume—was of no direct biological significance. This view has in late years been entirely revised. We have learned that the leguminous plants when assisted, symbiotically, by certain soil bacteria, are enabled to make up their nitrogen deficit in large part from the free nitrogen of the air; a fact that sheds important light upon the significance of plants of this type in the practice of "rotation of crops." Under normal conditions instead of impoverishing the soil, the legumens—clover, peas, beans, etc.,—with the aid of the bacteria attached to their roots, may actually enrich it. The application of bacteriological

methods to the study of dairy processes has revealed the interesting fact that the delicate flavors to which butters and cheeses owe their commercial value are directly due to the products of growth of certain species or groups of species of bacteria and more highly organized molds. A number of such species have been isolated and are kept in pure cultivation—so that by purposely inoculating the fresh cream with them butter of uniform flavor may with comparative ease be produced.

Probably the most important results of applied bacteriology are those in connection with preventive medicine. Early in the course of the work it was discovered by Pasteur that certain virulent pathogenic bacteria when kept under particular conditions gradually lost their disease-producing power, wholly or in part, without their other life properties being conspicuously disturbed. If injected into animals when in this attenuated state the result was a mild, temporary, and modified form of infection usually followed by recovery. With recovery the animals so treated were immune from the activities of the fully virulent bacteria of the same species; in other words, they had been protected from the fatal injection by vaccination with an attenuated species. The subsequent developments growing out of this observation have resulted in the annual saving of millions of money through the successful vaccination of sheep, horses, and bovines against the fatal infection known as splenic fever or anthrax, and, though less successfully, of other domestic animals against other infections also. In the closer analysis of the means by which infective bacteria cause disease it soon became evident that it is through the elaboration of specific poisons; sometimes easily separated from the bacteria, at others so intimately associated with the bacterial tissues as to make their separation difficult or impossible. The question arose as to the effect of the poisons, separated from the living bacteria, upon the animals susceptible to infection by the bacteria themselves, and it was found that fatal intoxications often accompanied by the same constitutional symptoms and pathological lesions followed the use of the poisons, just as would follow inoculations with the bacteria by which they were produced. In pursuance of this topic it was discovered that if very small, only mildly intoxicating doses of these specific poisons of bacterial origin were repeatedly injected into susceptible animals that after a while the latter acquired not only a sort of tolerance to them, but a tolerance that was accompanied by the presence in the circulating blood of an antidote for these poisons—an "antitoxin," as it is called. This reaction has been shown to be possible for a number of specific infections, and in the case of diphtheria has met with such practical success as to be deservedly regarded as the triumph of modern medicine.

A. C. ABBOTT,

Bacteriologist, University of Pennsylvania.

Bacteriolytic, an agent capable of destroying bacteria and usually applied to some product of the human body, or of an animal body, notably blood serum, which when injected into an animal is capable of destroying some form of micro-organism in that animal. The production of specific bacteriolytic sera is one of the great advances in modern medicine and its extension promises much hope for the future treatment of many of the bacterial diseases. Bacteriolytic sera have been made for a number of micro-organisms. See IMMUNITY.

Bacterium, a genus of bacteria of the family *Bacillariaceae*, characterized by rod-shaped forms and absence of flagella. They are thus non-motile. A large number of pathogenic bacteria belong to this genus. See BACTERIA; BACILLUS.

Bac'tria. See BACTRIANA

Bactriana, bāk-trī-ā'na, or **Bactria**, a country of the ancient Persian empire, lying north of the Hindu Kush Mountains, on the Upper Oxus. It corresponded pretty nearly with the modern Balkh. Here many scholars locate the original home of the Aryan or Indo-European family of nations. Its capital, Bactra, or Zariaspa, was also the cradle of the Zoroastrian religion. Originally a powerful kingdom, it maintained its independence until its subjugation by Cyrus about 540 B.C., when it became a satrapy of the Persian empire. It was included in the conquests of Alexander, and formed a part of the kingdom of the Seleucidæ until the foundation, about 256 B.C., by Diodotus, of the Greek kingdom of Bactria, which extended to the Indus, and which, after a long struggle, was overthrown by the Parthians. Numerous coins with Greek legends have been found in the *topes* or burial places to the northeast of Kabul.

Bac'trian Cam'el. See CAMEL.

Bac'tris, a genus of American palms, numbering more than 50 species. The genus is of commercial importance, a tough thread used for net weaving, being made from the fibres of *Bactris acanthocarpa*, and walking-sticks are manufactured from the long slender stems of *Bactris maraya*. The fruit of the latter is considered a delicacy.

Bactrites, bāk-trī'tēz, a genus of fossil ammonites, with a straight shell, and indented, but not ramified septa. The genus ranges from the lower Silurian to the Devonian.

Bac'trus, the ancient name of a river in the province of Balkh, central Asia, upon which Bactria was situated.

Baculites, bāk'ū-lī'tēz, a genus of fossil ammonites, characteristic of chalk formations, having a straight, tapering shell.

Bacup, bāk'ūp, England, a town of Lancashire, 18 miles north from Manchester. There are a number of churches, chapels, and schools, a mechanics' institute, court-house, market-hall, large co-operative stores, etc. The chief manufacturing establishments are connected with cotton spinning, and power-loom weaving; there are also iron and brass foundries and machine-shops, dye-works, etc., and in the neighborhood coal-pits and vast stone quarries. Its charter of incorporation was granted in 1882. Pop. (1901) 22,505.

Baczko, bāts'kō, **Ludwig von**, German historian and scholar: b. Lick, Prussia, 8 June 1756; d. 27 March 1823; was educated at Königsberg, studying philosophy, medicine, and law, but became blind in 1777, through an attack of small-pox. In 1816, he was appointed director of the Institute for the Blind at Königsberg. He is the author of 'A History of Prussia,' a 'History of the French Revolution,' and 'Concerning Myself and My Companions in Misfortune, the Blind' (1807).

Bad Lands, a name applied to the arid regions of the west, where are districts presenting wide areas of hills and ridges of moderate height, bare of sod and intricately broken by numerous gullies and ravines. The principal areas are in the western Dakotas and central Wyoming, and smaller examples of bad-land topography are of frequent occurrence in the arid regions in various portions of the world. In the Big Bad Lands of western South Dakota, east of the Black Hills, there is an area of about 2,000 square miles, which consists largely of bad lands occupying extensive basins cut in a plateau along the White and Cheyenne rivers. They present wonderfully weird scenery, but are rarely visited by the average sight-seer. An extensive area in the valley of the Little Missouri River is crossed by the Northern P. R.R. in the vicinity of Medora, and many bad-land features are visible near the railroad. Typical bad lands present ridges and mesas from 200 to 400 feet high in greater part, eroded into fantastic shapes and cut by ravines and gullies into an endless variety of rugged buttresses and pinnacles. The materials are mainly light-colored, sandy clays, and soft sandstones in nearly horizontal strata, and their bare slopes are dazzling in the bright sunlight. Most bad land regions were table-lands originally, and areas of the old surface remain in level-topped, grass-covered mesas of various sizes, with bad land slopes extending to flat-bottomed valleys of greater or less width. Bad lands exhibit clearly the close relations of topographic form to rock texture, the homogeneous clays being carved into regular slopes, in which sandstone layers give rise to benches, or protect columns and pinnacles of clay. Bad lands are developed in soft rocks where a region has been so uplifted that there is rapid erosion, under arid or semi-arid climatic conditions. The occasional rains cut gullies which eventually are deepened into ravines, and, as the rocks are soft, the erosion progresses more rapidly than vegetation can establish itself. In regions of abundant rainfall, vegetation is so vigorous that it usually forms a protective mantle on all but the steeper slopes, but in arid lands, a thin sod is the principal growth, and it is quickly removed by the rapid run-off of the torrential rains. The Big Bad

BADAGRI — BADEN

Lands of South Dakota have yielded large numbers of fossil animals of late Eocene age, which have made the region famous as a collecting ground.

N. H. DARTON,
U. S. Geological Survey.

Badagri, ba'da-grē, or **Badagry**, a British seaport on the Bight of Benin, in the extreme southwest corner of the British Niger Territory, Africa. Early in its history it was a noted slave mart; contained important manufactories; and had a population of 10,000. It was from this place that, in 1825, Clapperton and Lander started to explore the African interior.

Badajoz, ba'da-hōth', the capital of the Spanish province of Badajoz, on the left bank of the Guadiana, which is crossed by a stone bridge of 28 arches. It is a bishop's see, and has an interesting cathedral. During the Peninsular war, Badajoz was besieged by Marshal Soult, and taken in March 1811. It was twice attempted by the English, on 5 and 29 May 1811; was besieged by Wellington on 16 March, and taken 6 April 1812. Pop. 22,860.

Badakhshan, ba'dakh-shan', a territory of central Asia, tributary to the ameer of Afghanistan. It has the Oxus on the north and the Hindu Kush on the south; and has lofty mountains and fertile valleys; the chief town is Faizabad. The inhabitants profess Mohammedanism. Pop. 100,000.

Badalona, ba'da-lō'na, a seaport of Spain, on the Mediterranean, five miles from Barcelona. Pop. 19,200.

Baddeck', a fishing village and summer resort on Cape Breton Island.

Bad'derlocks (*alaria esculenta*), an olive-colored sea weed which grows on rocks in deep water on the shores of Europe and Iceland. It has a short cylindrical stem with lateral spore-bearing process, and a membranous olive-green frond of 2 to 12 feet long, with a stout midrib. This midrib, together with the fruits, is eaten by the inhabitants of the sea coasts of Iceland, Denmark, Scotland, Ireland, etc., and is said to be the best of the esculent algae. The name is supposed to be a corruption of balder-locks.

Badeau, ba-dō', **Adam**, American military officer: b. New York, 29 Dec. 1831; d. 19 March 1895; was educated at private schools. He served with gallantry in the Union army during the Civil War; was on the staff of Gen. Sherman in 1862-3, and secretary to Gen. Grant in 1864-9; and in the latter year was retired with the rank of captain in the regular army and of brevet brigadier-general of volunteers, and was appointed secretary of legation in London. He was consul-general in London, 1870-81, and during this period was given leave of absence to accompany Gen. Grant on his tour around the world (1877-8). In 1882-4 he was consul-general in Havana. After the death of Gen. Grant he brought suit against his heirs for payment of services which he asserted had been rendered in the preparation of Gen. Grant's 'Memoirs,' but lost his case. His publications include: 'The Vagabond' (New York 1889); 'Military History of Ulysses S. Grant' (3 vols. 1867-81); 'Conspiracy; A Cuban Romance' (1885); 'Aristocracy in England' (1886); and 'Grant in Peace' (1886).

Baden, bā'dēn, a grand duchy in the German empire. The Rhine separates it from Al-

sace on the east, and Wurtemberg bounds it on the west. It has an area of 5,823 square miles, with a population of 1,866,584 in 1900, an increase of 121,120 over the census of 1895, or a gain of 1.58 + per cent each year. The country is mountainous, being traversed by the lofty plateau of the Schwarzwald, or Black Forest, which attains its highest point in the Feldberg (4,904 feet). The nucleus of this plateau consists of gneiss and granite. In the north it sinks down toward the Odenwald, which is, however, of different geological structure, being composed for the most part of red sandstone. The whole of Baden, except a small portion in the south-east, in which the Danube takes its rise, belongs to the basin of the Rhine, which bounds it on the south and west. Numerous tributaries of the Rhine intersect it, the chief being the Neckar. Lakes are numerous, and include a considerable part of the lake of Constance. The climate varies much. The hilly parts, especially in the east, are cold and have a long winter, while the valley of the Rhine enjoys the finest climate of Germany. The principal minerals worked are coal, salt, iron, zinc, and nickel. The number of mineral springs is remarkably great, and of these not a few are of great celebrity. The vegetation is peculiarly rich, and there are magnificent forests. The cereals comprise wheat, oats, barley, and rye. Potatoes, hemp, tobacco, wine, and sugar beet are largely produced. Several of the wines, both white and red, rank in the first class. Baden has long been famous for its fruits, also. Of the total area, 42 per cent is under cultivation, 37 per cent under forest, and 17 per cent under meadows and pastures. The farms are mostly quite small. The manufactures are important. Among them are textiles, tobacco, and cigars, chemicals, machinery, pottery ware, jewelry (especially at Pforzheim), wooden clocks, confined chiefly to the districts of the Black Forest, musical boxes, and other musical toys. The capital is Carlsruhe, about five miles from the Rhine; the other chief towns are Mannheim, Freiburg-im-Breisgau, with a Roman Catholic university; Baden, and Heidelberg. Baden has warm mineral springs, which were known and used in the time of the Romans. Heidelberg has a university (Protestant), founded in 1386, the oldest in the present German empire. The railways have a length of 850 miles, and are nearly all state property.

In the time of the Roman empire, southern Baden belonged to the Roman province of Rhætia. Under the old German empire it was a margravate, which in 1533 was divided into Baden-Baden and Baden-Durlach, but reunited in 1771. The title of grand duke was conferred by Napoleon in 1806, and in the same year Baden was extended to its present limits. The executive power is vested in the grand duke, the legislative in a house of legislature, consisting of an upper and a lower chamber. The former consists partly of hereditary members; the later consists of elected representatives of the people. The revenue is mainly derived from taxes on land and incomes, and the produce of crown-lands, forests, and mines. The revenue in 1901 was \$37,723,000. Baden sends three members to the German Bundesrath, or Federal Council, and 14 deputies to the Reichstag. Two thirds of the population are Roman Catholics, the rest Protestants.

BADLANDS.

Typical views in Big Badlands of South Dakota, showing pinnacles of hard clay capped by sandstone, the sodless slopes, and in the distance a remnant of the original plateau out of which the Badlands are eroded.

BADEN — BADGER

Ba'den, a town in Switzerland, canton Aargau. The town (*Ober-Baden*, or *Baden-im-Aargau*) is 12 miles northeast of Aarau, on the left bank of the Limmat. It has a town-hall, a handsome Roman Catholic church, a convent, monastery, hospital, etc., and is celebrated for its hot sulphurous baths, which are employed in gout, rheumatism, and cutaneous diseases. The hottest springs have a temperature of 116° F. The Romans were well acquainted with the baths here; and between the 15th and 18th centuries they were the most celebrated in Europe. Pop. (1900) 6,100.

Bad'en-Ba'den (anciently, *Civitas Aurelia Aquensis*), a town and watering-place in the grand-duchy of Baden, 18 miles south-southwest of Carlsruhe. The older part of the town is built on a spur of the Black Forest, overhanging the valley of the little stream Oosbach. The houses here are in general old and high; the streets mostly narrow and crooked, and nearly all steep. The new and larger portion of the town lies below, and is rich in fine hotels, elegant villas, and handsome private dwellings. The edifices most deserving of notice are the New Palace, standing on an isolated height above the town, and surrounded by fine gardens; the town or parish church, containing the tombs of 14 margraves of Baden; the Protestant church, the English church, and the new town-hall. Baden has been celebrated from remote antiquity for its thermal baths, which made it a favorite resort of the Romans. The season lasts from 1 May to 31 October, and 60,000 visitors arrive annually. Pop. (1900) 15,700.

Baden-Powell, bā'dēn-pow'ī, **Sir George Smyth**, English politician and political writer. b. Oxford, 24 Dec 1847; d. 20 Nov. 1898. He became a member of various important commissions, among others that on United States and Canadian fisheries (1886-87); the new Malta Constitution (1887); the Bering Sea inquiry (1891); the Joint High Commission (Washington, 1892); and the Paris Arbitration (1893). He was author of 'New Homes for the Old Country' (1872), a storehouse of information about Australia; 'Protection and Bad Times' (1879); 'State Aid and State Interference' (1882); 'The Truth About Home Rule' (1888); 'The Land Systems of India' (1892); etc. He was a member of Parliament from Liverpool from 1885 till his death.

Ba'den-Pow'ell, **Robert Stevenson Smyth**, British military officer; b. London, 22 Feb. 1857; was educated at the Charterhouse School; joined the 13th Hussars in 1876; was adjutant in India, Afghanistan, and South Africa; Assistant Military Secretary on the staff in South Africa in 1887-9; took part in the operations in Zululand, for which he was highly commended, in 1888; assistant military secretary in Malta in 1890-3; on special service in Ashanti, commanding the native levies, 1895, for which he was brevetted lieutenant-colonel; chief staff officer in the Matabeleland campaign, for which he was brevetted colonel, and became lieutenant-colonel, commanding the 5th Dragoon Guards, in 1897. In the war in South Africa in 1899-1900, he signally distinguished himself by his grand defense of Mafeking, Cape Colony, holding the town with a small force against repeated attacks, under an almost continuous bombardment, from 15 Oct. 1899, to 16 May 1900. Three

relief columns were started, the last only being successful. In recognition of this heroic defense, the queen promoted Baden-Powell to be a major-general. Gen Baden-Powell has published several works, including 'Reconnaissance and Scouting' (1890); 'Vedette' (1890); 'Cavalry Instruction' (1895); 'The Downfall of Prempeh' (1896); 'The Matabele Campaign' (1896), etc.

Baden-bei-Wien, bā'dēn-bī-vēn, a watering place of lower Austria, about 15 miles south-southwest of Vienna. It was the *Aquæ Pan-noniæ*, or *Cethiæ* of the Romans, and is still famous for its warm mineral springs, which are frequented during the season by from 12,000 to 15,000 persons, chiefly from the Austrian capital. Season from July to September. Pop. (1900) 17,700.

Badeni, bā'dēn-ē, **Count Cassimir Felix**, Austrian statesman; b. Poland, 14 Oct. 1846. His father, though poor, was a man of intellect, and was made a count by the king of Poland just before the birth of Cassimir. He also fell heir to a fortune, and his two sons received a university education. Cassimir entered the Austrian civil service; became district chief at Zolkiew in 1871; minister of the interior in 1873; governor of Galicia in 1888; and prime minister of Austria-Hungary, 15 Sept. 1895. In April 1897, because of inability to maintain a Liberal majority in the newly elected Reichsrath, he resigned with his cabinet, but the emperor declined to accept his resignation, and he remained in office until 28 November, when he again resigned and a new cabinet was organized. The principal feature of his administration and the one which not only caused his fall, but a long period of political agitation, was his introduction of what is known as the "language ordinance," which allowed the official use of the Czech language in Bohemia and Moravia. This measure alienated the Germans and provoked a racial conflict of a most bitter character between them and the Czechs.

Badenweiler, bā'dēn-vī-lēr, a watering place in the grand duchy of Baden, near Mullheim. Its mineral springs are now rated among the indifferent waters, and it is of interest chiefly for the ruins of Roman baths that were discovered in 1847. The foundation of the town is referred to the time of Hadrian, and the remains of the vapor baths, of which there are excellent specimens, are supposed to be of the same period. The ruins show a division for men and for women, each having a large outer court opening into a dressing-room; there is the hot-air bath, the warm bath, and the cold bath. The walls and steps are in their original position. The whole structure is 318 feet by 90 feet.

Badge, a distinctive device, emblem, mark, honorary decoration, or special cognizance, used originally to identify a knight or distinguish his followers, now worn as a sign of office or licensed employment, as a token of membership in some society, or generally as a mark showing the relation of the wearer to any person, occupation, or order.

Badg'er, **George Edmund**, American statesman; b. Newbern, N. C., 13 April 1795; d. 13 April 1866; was graduated at Yale College in 1813; became a lawyer at Raleigh; and was judge of the North Carolina Superior court

BADGER—BADGLEY

in 1820-5. He was appointed secretary of the navy, 14 March 1841, resigning after the death of President Harrison, and was elected to the United States Senate in 1846 and 1848. In 1853 he was nominated for justice of the United States supreme court, but was not confirmed. He served in the State convention called to pass on the question of secession, although opposed to such measure, and after making a strong speech in defense of the Union, was afterward known as a member of the Conservative party.

Badger, Joseph, American clergyman, one of the earliest missionaries to the country northwest of the Ohio River: b. Wilbraham, Mass., 28 Feb. 1757; d. 5 May 1846. He received his early instruction chiefly from his parents, and at the age of 18 joined the Revolutionary army. He remained in service for four years, then determined to obtain an education and engage in the Christian ministry. Entered Yale College in 1781, where he maintained himself and his scholarship by alternately studying and teaching. He remained a few years in Connecticut, then in 1800 was selected by the missionary society of that State to visit the unsettled parts of Ohio. His work took him from settlement to settlement, often more than a day's journey apart, through a country where there were no roads, and across rivers without bridges. During the War of 1812 he was appointed by Gen. Harrison chaplain to the army in that district, and his knowledge of the country was of great service to that commander-in-chief; but he resumed his missionary functions at the close of the war and continued them till 1835, when he retired and lived with his only daughter. During the latter years of his life he received a pension from the United States.

Badger, Oscar L., American naval officer: b. Windham, Conn., 12 Aug. 1823; d. 20 June 1899; entered the United States navy, 9 Sept. 1841; became lieutenant-commander, 16 July 1862; commander, 25 July 1866, captain, 25 Nov. 1872; commodore, 15 Nov. 1881; and was retired 12 Aug. 1885. He served on the steamer Mississippi during the Mexican war, taking part in the attack on Alvarado, 1846; led the party that attacked and destroyed the village of Vutua, Fiji Islands, while on the sloop John Adams, 1855-6; and in the Civil War commanded the Anacostia, of the Potomac flotilla, 1861-2, and the ironclads Patapsco and Montauk, in the operations in Charleston harbor in 1863; and was acting fleet captain on the flagship Weehawken in the attack on Fort Sumter, 1 Sept. 1863.

Badger, a stout, burrowing, carnivorous mammal of the fur-bearing family *Mustelidae*, related to the skunks and weasels, species of which inhabit various parts of the northern hemisphere. Badgers have short legs, elongated feet with powerful toes adapted to digging, heavy jaws with big teeth, and great strength, courage, and cunning. They wear coats of thick fur usually grizzled in brown and gray, the face is striped and the paws are blackish. The fur is of considerable value. The American badger (*Taxidea americana*) was formerly distributed all over the western part of the United States from the prairie districts of Ohio and Wisconsin to the Pacific coast, but has been exterminated by civilization east of

the dry plains, where it is still numerous although not often seen, because it rarely comes abroad except in the night. It dwells in deep burrows which it digs for itself and feeds upon gophers, ground-squirrels, such ground-building birds and their eggs and young as it is able to catch, and, in times of scarcity, upon small reptiles and insects. Badgers abound in the vicinity of prairie-dog towns, whose underground homes they can enter or dig out without difficulty. This species is found as far north as Hudson Bay and south to central Mexico, where the local variety is called "tejon." When by rare chance a badger is surprised during the day too far away from his hole to escape into it before being observed, he squats down, withdrawing nose and feet beneath his body, and remains absolutely still, when his grizzled back looks so much like a mere hillock of earth that he is likely to escape being seen altogether. The extraordinary breadth and fatness of his form is one of his strongest characteristics. During the coldest part of the winter he retires to his den and passes the time when no food is to be had in deep sleep. The best account of this animal is to be found in Dr. Coues's 'Furbearing Animals' (Washington 1877). Consult also Ernest Ingersoll's 'Wild Neighbors' (New York 1897). The European badger (*Meles taxus*) is very similar in general appearance but differs in anatomical details. Its general habits and food are like those of the American badger except that in the absence of open plains it dwells in wooded regions and has a fondness for honey, digging it out of the nests of bumblebees and others which make their homes in the ground. This is the animal formerly used in the cruel sport of badger-baiting. A captive badger was placed in an overturned barrel or some similar place, and dogs were set upon it for the amusement of seeing the fighting that resulted. It required a powerful and active dog to overcome the little animal. Frequently, however, the badger was given no fair chance, but was compelled to face in the open two or three dogs. From this unmanly sport is derived the verb "to badger." Many references are to be found in early English literature to this amusement, and to the animal itself under the old terms "grey" and "brock," the latter still in common use in northern England and Scotland. Various closely related species and varieties of the badger are to be found in northern Asia, and other relatives exist in India, Malay Islands, and Africa. For these see SAND-BADGER; HONEY BADGER; RATEL; TELEDU; ZORILLA.

Badger State, a nickname given to the State of Wisconsin.

Badghis, bad-gêz', a region north of Herat, comprising the country between the Murghab and the Harirud rivers, as far north as the edge of the desert. It lies just to the south of the boundary line between Afghanistan and the Russian territories, as defined in 1887.

Badgley, Sidney Rose, Canadian architect: b. near Kingston, Ont., 28 May 1850. He studied architecture in Toronto, and, after practising some time in St. Catharines, established himself in Cleveland, O. He has made a specialty of the architecture of churches and public buildings, and has planned and erected churches

in almost all parts of Canada and the United States, and, among other structures, the Massey Music Hall, Toronto; the Slocum Library and Perkins Observatory, in Ohio; Wesleyan University, in Delaware, and the Medical College, Cleveland. He published an 'Architectural Souvenir' (1896).

Badham, bād'ām, **Charles**, English educator: b. Ludlow, 18 July 1813, d. 26 Feb. 1884; was considered one of the most eminent classical scholars of his day; and after serving for several years as head master of King Edward VI.'s Grammar School at Louth, he became professor of classics and logic in the University of Sydney, Australia, 1867. While in Sydney he established a system of teaching by correspondence, similar to the present university extension scheme. He published a number of works on Greek classics, and 'Criticism Applied to Shakespeare' (1846).

Badia y Leblich, ba-dē'a e lā-blēch', **Domingo**, Spanish traveler b 1766, d 1818; he visited in 1803 and the four following years the Mohammedan countries bordering on the Mediterranean. During the whole of his tour he professed to be a Mussulman, and traveled under the denomination of "Alī Bey el Abbassi." He was so skilful in carrying out his part that he deceived Moslem rulers and scholars, and was at one time in great favor in the court of Morocco. It is now admitted that he was employed as a political agent by the Prince of Peace, at the instigation of Napoleon. His peculiar situation and religious profession gave him opportunities for making many observations which could not occur to other travelers, and he published an account of his travels, with the title 'Voyages d' Ali Bei en Afrique et en Asie.'

Badinguet, ba'dān-gā', afterward **RADOT**, a Moor, as whom Napoleon III masqueraded to escape from the fortress of Ham in 1846; afterward a nickname for Napoleon III. He died in 1883.

Badius, ba'de-us, French printer and writer: b 1462; d. 1535. About 1500 he founded his printing establishment at Paris, and published a number of the classics. He annotated these himself and wrote also a life of 'Thomas à Kempis.'

Bad'lam, **Stephen**, American military officer: b. Milton, Mass., 25 March 1748; d. 24 Aug. 1815; entered the Revolutionary army in 1775; became commander of the artillery in the Department of Canada. On the announcement of the adoption of the Declaration of Independence, he took possession of the heights opposite Ticonderoga and named the place Mt. Independence. Subsequently he rendered good service at Fort Stanwix, and in 1799 was made brigadier-general.

Bad'man, **The Life and Death of Mr.**, an allegory by John Bunyan, published in 1680. It gives a vivid picture of the life of the common people during the time of Charles II.

Bad'minton. The game now called Badminton is in reality a modification of the very ancient game of battledore and shuttlecock; but it is played on a court 44 feet long by 20 wide over a net strung across the centre not less than 18 inches deep, with its lower edge five feet from the ground. The bat is strong, like a racquet bat, and weighs about five ounces. The shuttle-

cock is feathered after the old fashion. The service line is drawn six and one half feet from the net on either side. A line drawn down the centre, joining the service and base lines, forms two courts at each end. The game can be played by two or four, six or eight players. Each striker scores, or is penalized, according to the result of the rules. See 'The Encyclopædia of Sport' (N. Y. 1898).

Bad'minton, a special, sweetened claret, named for the Duke of Beaufort (of Badminton). As he was a patron of pugilists, the term came to mean, in the prize ring, blood, for which claret was previously a slang term.

Badoc, ba-dōk', Philippine Islands, a town of the province of Ilicos Notre, on the Island of Luzon. Pop. 11,000.

Badoura, ba-doo'ra, the daughter of the king of China, who falls in love with the sleeping prince in the story of Prince Camaralzaman, in the 'Arabian Nights' Entertainment.

Badrinath, ba'dri-nath', a peak of the main Himalayan range, in Garhwal district, Northwestern Provinces, India; 23,210 feet above the sea. On one of its shoulders, at an elevation of 10,400 feet, stands a celebrated temple of Vishnu, which some years attracts as many as 50,000 pilgrims.

Badrulbudar, ba-drool'boo-door', the wife of Aladdin, in the 'Arabian Nights' Entertainment, story of Aladdin and the lamp.

Bæbia Gens, bē'bī-a jēnz, a plebeian clan of ancient Rome. The first member of the family to obtain the consulship was Cn Bæbius Tamphilus (182 B.C.). The other distinguished ones are known under their family names, Dives, Herennius, Sulca, etc.

Baedeker, bād'ē-ker, **Karl**, German publisher b 1801; d 1859; originator of a celebrated series of guide-books for travelers.

Bæle, ba-ā'lē, an African tribe dwelling northeast of Lake Tchad. It is nomadic, half heathen and half Mohammedan, and owns large herds of cattle, camels, goats, and sheep.

Baena, ba-yā'na, **Antonio**, Portuguese-Brazilian historian and geographer: b Portugal about 1795; d 28 March 1850; was an officer in the Portuguese, afterward in the Brazilian, army. He studied the geography and history of the Amazon valley. His principal works were 'The Ages of Pará' (1838), a historic compend stopping in 1823, and 'Chorographic Essay on the Province of Pará' (1839), a geographical and statistical work, giving the details of explorations made by himself. These are still standard authorities on that region.

Bae'na, Spain, a town in province of Andalusia, 24 miles south-southeast from Cordova, on the Marbella. It has two principal and two smaller squares, four parish churches, a town- and court-house, several well-attended schools, two hospitals, a prison, numerous convents, and manufactures of linen, woolen and cotton fabrics. Large quantities of grain and oil are exported to Malaga. Pop. (1897) 11,994.

Baer, bār, **Karl Ernst von**, Russian naturalist: b. Piep, Esthonia, 28 Feb 1792; d. 28 Nov. 1876; was professor of zoology at Königsberg (1819), and librarian of the Academy of Sciences at St Petersburg (1834). His principal works were 'History of the Development of

BAER — BAFFIN BAY

Animals' (2 vols. 1828-37), and 'Researches Into the Development of Fishes' (1835). The writings of Baer are distinguished for their philosophical teachings.

Baer, William Jacob, artist: b. Cincinnati, 29 Jan. 1860. He studied at the Munich Royal Academy, 1880-4, receiving four medals there, and one of his works being purchased by the Academy. Between 1885 and 1892 he painted portraits and pictures, the latter chiefly in the genre style. He then devoted himself almost exclusively to miniature painting, of which he became a pioneer of the modern school. 'Aurora,' 'The Golden Hour,' 'In Arcadia,' and 'The Madonna with the Auburn Hair' are among his best-known miniatures.

Baert, ba-är, Alexandre Balthazar François de Paule, Baron de, French writer: b. Dunkirk about 1750; d. 23 March 1825; became a deputy in the General Assembly of 1789. When the Revolution became the Reign of Terror, he fled to the United States, remaining there some years. He returned to France in 1815, and once more became deputy, maintaining his old position as a moderate reformer. He published two historical works, one on Great Britain and her colonies, the other on the country between the Black and Caspian seas.

Baert', or Bart, Jean, French sailor: b. Dunkirk, 1650; d. 1702. He raised himself, under Louis XIV., to the rank of commodore, and made the French navy what it was, at that time. The Dutch, English, and Spanish called him the "French Devil." Bart brought into port a number of Dutch and English vessels, burned others, landed at Newcastle, and laid waste the neighboring country. In 1694, when there was a scarcity of corn in France, he succeeded several times, notwithstanding the watchfulness of the English, in bringing into the harbor of Dunkirk ships loaded with this article. Once he delivered a number of such vessels, in the boldest manner, from the Dutch, into whose hands they had fallen, and received, in consequence, letters of nobility. In 1695 he was taken prisoner by the English and brought to Plymouth, but managed to make his escape. In 1696 he met the Dutch fleet from the Baltic and captured the escort with 40 ships; but on his return to Dunkirk 13 Dutch ships of the line appeared, and to avoid a very unequal combat he was obliged to burn the greater part of his captures. From the Peace of Ryswick to the breaking out of the war of the Spanish succession he lived at Dunkirk.

Bætica, bē'tī-ka, the central division of ancient Spain under Roman rule, famed for its fertility, its mines of iron, gold, and silver, and its delightful climate. These advantages gave rise to a number of fabulous stories, which made it the home of Geryon, an assailant of Hercules, and placed there the Elysian Fields. It passed into the hands of the Vandals, and it was the first province conquered by the Moors.

Baeyer, bā'yér, Adolf von, German chemist: b. Berlin, 31 Oct. 1835; son of Johann Jakob Baeyer; became professor of chemistry at Strasburg in 1872, and at Munich, in 1875, succeeding Liebig at the latter. He made many important discoveries in organic chemistry, especially cerulein, eosin, and indol.

Bae'yer, Johann Jakob, Prussian geometer: b. Muggelsheim, 5 Nov. 1794; d. 10 Sept. 1885; was an army volunteer in the campaigns of 1813 and 1814; joined the army in 1815; and became a lieutenant-general in 1858. He had charge of a number of geodetic surveys; was elected president of the Geodetic Institute in Berlin in 1870; and was the author of numerous treatises on the refraction of light in the atmosphere, the size and form of the earth, etc.

Baez, ba'ath, Buenaventura, Dominican statesman: b. Azua, Haiti, about 1810; d. 21 March 1884; aided in the establishment of the Dominican Republic; was its president in 1849-53; was then expelled by Santa Ana and went to New York; was recalled in 1856 on the expulsion of Santa Ana, and again elected president; and was re-elected president in 1865 and 1868. During his last term he signed treaties with the United States (29 Nov. 1869) for the annexation of Santo Domingo to the United States, and for the cession of Samana Bay. The treaties failed of ratification in the United States Senate, and caused the downfall of Baez.

Baeza, bà-ā'tha, Spain, a town of Andalusia, 22 miles east-northeast from Jaen. It is pleasantly situated on a height amid rich and well-watered plains, and from a distance presents a very striking appearance with its old walls, churches, and steep-roofed houses. It has several good streets and three squares, one of which is lined by a range of porticoes. The principal edifices are the cathedral, the old Alatares tower, the town-hall with a fine façade, and an old monastery, now a theatre. Pop. (1902) about 14,300.

Baffa, bā'fa, a seaport on the southwest coast of Cyprus. It occupies the site of New Paphos, which, under the Romans, was full of beautiful temples and other public buildings.

Baffin, William, English navigator: b. about 1584; d. 23 May 1622. He visited west Greenland as a pilot in 1612, again in 1615, and made voyages to Spitzbergen in 1613 and 1614. In 1616 he ascertained the limits of that vast inlet of the sea since distinguished by the appellation of Baffin Bay, and also discovered and named Smith's Sound, Lancaster Sound, etc. In 1617-22 he was in the employment of the East India Company, and on board vessels belonging to them in the Indian seas. He was killed at the siege of Ormuz, on the Persian Gulf.

Baffin's Bay, an inland sea or gulf in North America, between Greenland and the lands or islands north of Hudson Bay, extending from 68° to 78° N., and 55° to 80° W. It communicates with the Atlantic Ocean by Davis Strait on the south, with the Arctic Ocean by Lancaster Sound and Jones Sound on the west, and with the Polar Sea by Smith Sound and Robeson Channel on the north. Depth, 200 to 1,050 fathoms. The tides do not rise more than 10 feet. The surface of the sea is covered with ice during the greater part of the year, which extends from shore to shore in winter, though possessing a slow, southward movement. In spring and summer, the great mass, known as the middle ice, begins to move less slowly southward, leaving navigable passages on the

BAFFIN LAND — BAGDAD

side of Greenland and America, and occasional channels, or crossings, between these coasts. The coasts are mountainous, barren, and deeply indented with gulfs. Whale and seal fishing is followed. This sea was discovered by the English navigator, Baffin (q.v.), in 1616, while in search of a passage to the Pacific.

Baffin Land, an island in the Arctic regions west of Greenland. Its area is not exactly known.

Bafulabe, ba'fu-lāb, a town of the French Sudan, at the junction of two head-streams of the Senegal, connected by railway with Kayes on that river.

Bagamoyo, ba'ga-mō'yō, a seaport and commercial centre of German East Africa opposite Zanzibar, and north of Dar-es-Salaam. Though it has no harbor, and its coast is often swept by hurricanes, it has a considerable trade in ivory, copra, caoutchouc, etc. It has a fort, government house, custom-house, post-office and telegraph building, station of the German East African Association, government school, etc. The climate is unhealthy for Europeans. Pop. about 18,000.

Bagasse, ba-gās', the name given to sugar cane in its dry, crushed state, as delivered from the mill, and after the main portion of its juice has been expressed; used as fuel in the sugar factory, and called also cane trash.

Bagatelle, bāg'a-tēl', a table ball game of the class of billiards, played on a table semi-circular at the top end. The tables vary from 6 to 7 feet in length and are usually about 3 feet 6 inches wide. The game is played by two or more, one against the other. There are nine balls, eight white and one black, and nine holes sunk in the far end of the table in a diamond shape, numbered respectively 1, 2, 3, 4, 5, 6, 7, 8, 9.

. . .
. . .
. . .
.

The black ball is placed on a spot * in front of the foremost hole. The player then takes one of the white balls, and placing it within a balk line at the lower end of the table, strikes it with the cue in such a manner that it strikes the black ball; both balls go on their courses and fall, or not, into one or other of the open cups. Whichever cup the black ball falls into counts double the number of points normally allotted to it. Then the player, in like manner, plays the remaining seven balls up the table. For so many cups as he fills he counts up his dots, and that is his score. The highest wins.

Bagaudæ, or **Bagaudi**, a body of Gallic insurrectionists of the rural class, who revolted against the Romans 270 A.D., headed by one Victoria, called by the soldiers Mother of Legions. Claudius temporarily quelled them, and Aurelian, by a remission of their taxes in arrears, and by granting them a general amnesty, made peace with them. Under Diocletian, 280 A.D., they rose again, and their two leaders assumed the title of emperor; but they were soon compelled to capitulate, though they retreated to an island formed by the confluence of the

Marne and Seine, and made a desperate stand for the victory. The place of this sanguinary contest was long known as the *Fosses des Bagaudes*. From this period, the Bagaudæ may be considered as gradually transforming their activity into a kind of brigandage, which infested the forests and fastnesses of Gaul until the end of the Western Empire.

Bag'by, George William, American physician and humorist: b. Buckingham County, Va., 13 Aug. 1828; d. 29 Nov. 1883; educated at Delaware College; wrote under the pseudonym, MOZIS ADDUMS. He was editor of the *Lynchburg Express* (1853), and 'Southern Literary Messenger' (1859); State Librarian of Virginia (1870-8), and contributor to various magazines. He wrote 'John M. Daniel's Latch-key' (1868); 'What I Did With My Fifty Millions' (1875); and 'Meekins' Twinses' (1877).

Bag'dad, a town in Tamaulipas, Mexico, near the mouth of the Rio Grande, the port of Matamoros. It was of great importance during the Civil War to Confederate blockade runners.

Bag'dad, capital of the Turkish vilayet of Bagdad, situated on the Tigris. The old Bagdad, the residence of the caliphs, said to have had 2,000,000 inhabitants, was situated on the western bank of the river. The modern city lies mostly on the eastern bank of the river and is surrounded with a brick wall about six miles in circuit, partly in a ruinous condition, and with a ditch from five to six fathoms deep, intended to be filled with water from the Tigris. The houses, mostly built of brick, are but one story high, the streets unpaved, and so narrow that two horsemen can scarcely ride abreast. The houses of the wealthy are distinguished by a better architecture. Of the mosques, about 100 in number, only a few attract much notice, and many are in ruins. Their architecture is in general inferior to that of other Mohammedan cities, but they have a gaudy appearance from the glazed tiles covering their domes and minarets, and arranged in a kind of mosaic work in various colors. The bazaars are spacious and well stocked with goods. That built by Daoud Pasha still ranks as one of the most splendid in the world. Bagdad long commanded a large part of the traffic between Europe on the one hand, and Persia and India on the other. The Persian and Indian trade is still considerable, as also that with Europe, a large portion of it being carried on by steamers up and down the river. The trade with Europe was formerly more largely by land, passing through the Syrian Desert to Damascus, or by way of Armenia northward. Since the opening of the Suez Canal the sea routes are of far more importance. Wool is the chief export to Europe, others being wheat, gum, galls, dates, etc. The heat of the summer is oppressive in Bagdad, but the winter is cold enough to make a fire necessary. The climate is on the whole agreeable and healthy, though sometimes the plague prevails. Bagdad is inhabited by Turks, Arabs, Persians, Kurds, Armenians, Jews, and a small number of Christians. The Turks compose three fourths of the whole population. The Jews are confined to a certain district of the city, and are in a very oppressed condition. The population of the city, according to the most recent estimate, amounts to between 175,000 and 200,000.

Bagdad was founded in 762 by the Caliph Almanzor, and was raised to a high degree of splendor in the 9th century by the famous Harun al-Rashid, who figures so often in the 'Arabian Nights'. It then became the chief city in the Moslem world and a great centre of culture and learning. In the 13th century it was stormed by Hulagu (Holagou), grandson of Genghis-Khan, who caused the reigning caliph to be slain and overthrew the caliphate. The descendants of the conqueror were expelled in 1392 by Tamerlane. In the 15th century Shah Ismael, the first sovereign of Persia of the house of Sofi, took possession of the city. From that time it was a perpetual subject of contest in the wars between the Turks and Persians. After a memorable siege in 1638 it was conquered by the Turkish emperor, Murad IV., and Nadir Shah endeavored in vain, in the 18th century, to wrest it from the Turks.

Bage, Robert, English novelist: b. Darley, Derbyshire, 29 Feb. 1728; began to write at the age of 53. Among his works were: 'Mount Henneth' (1781); 'Barham Downs' (1784); 'Hermesprong, or Man as He Is Not' (1796), etc. He died at Tamworth, 1 Sept. 1801.

Bagshot, bāj'ōt, Walter, English economist and journalist: b. Langport, Somerset, 3 Feb. 1826; d. 24 March 1877. He entered University College, London, in 1842, and after gaining great distinction in mathematics and philosophy he took the degree of M.A. in 1848. Four years later he was called to the bar, but instead of practising he went into business. He was one of the editors of the *National Review* (1855-64), and from 1850 till his death he was editor and part-proprietor of the 'Economist.' His chief works are: 'The English Constitution' (1867); 'Physics and Politics' (1872), 'an attempt to apply the principles of natural selection and inheritance to political society'; 'Lombard Street' (1873), a study of the money market; and 'Literary, Biographical, and Economic Studies' (1878-80), edited by R. H. Hutton.

Bag'gage, probably from the old French word *bague*, meaning bundle. As ordinarily used it includes trunks, valises, portmanteaus, etc., which a traveler carries with him on a journey. In England the word luggage is used to convey the same meaning. In a military sense the word includes the tents, furniture, utensils, and whatever else is indispensable to the comfort of an army.

Baggara, bāg'gā-rā, an Arabic-speaking Hamitic tribe of the Upper Nile valley. They occupy this valley as far east as the territory of their neighboring negro tribesmen, the Shilluk. They are nomads, Egyptian soldiers, hunters, etc.

Baggesen, Jens, Danish poet, who also wrote much in German: b. Korsør, 15 Feb. 1764; d. Hamburg, 3 Oct. 1826. He traveled extensively in Europe, and on his return received an appointment from the Danish government. He possessed great sensibility and imagination, and his works are said to present a singular mixture of contradictory qualities. His best productions are his smaller poems and songs, several of which are very popular with his countrymen. His 'Seasons,' in Danish, are much esteemed. The 'Labyrinth' is his most famous work.

Baghelkhand, bā-gēl-kūnd', a tract of country in central India, occupied by a collection of native states (Rewah being the chief, under the governor-general's agent for central India); area, 11,323 square miles; pop. 1,512,595.

Bagheria, ba'gā-re'a, or Bagaria, a town of Sicily, eight miles east by south of Palermo by rail. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini and is surrounded by groups of palatial villas of the Sicilian nobility. Pop. 12,650.

Bagimont's (bāj'i-mōnts) Roll, a rent-roll of Scotland, made up in 1275 by Baiamund or Boiamond de Vicci, vulgarly called Bagimont who was sent from Rome by the Pope, in the reign of Alexander III., to collect the tithe of all the Church livings in Scotland for an expedition to the Holy Land. It remained the statutory valuation, according to which the benefices were taxed, till the Reformation. A copy of it, as it existed in the reign of James V., is in the Advocates' Library, Edinburgh.

Bagirmi, ba-gēr'me, a Mohammedan negro state in central Africa, situated partly between Bornu and Wadai, to the southeast of Lake Chad, and watered by the Shari, which falls into Lake Chad, and by its tributaries. It has an area of about 65,000 square miles, and about 1,500,000 inhabitants; but both its area and population fluctuate according as it encroaches on or is encroached on by its neighbors. The whole country is a plain 900 feet above the level of the sea, well suited for the cultivation of sorghum, which is accordingly the principal breadstuff. Sesame, beans, cotton, and indigo are also cultivated. The government is an absolute monarchy, but the ruler pays tribute to Wadai. Bagirmi was formerly included in one state with Bornu and Wadai. An inexhaustible supply of slaves is found in the heathen negro states to the south, at the expense of whom also Bagirmi, when pressed by its Mohammedan neighbors, extends its territory. The capital is Masena, situated about the centre of the state. By Great Britain and Germany Bagirmi has latterly been recognized as within the French sphere of influence, and in 1897 a treaty was concluded between the French government and the Sultan. There is a French resident in the capital.

Bag'ley, Worth, American naval officer: b. Raleigh, N. C., 6 April 1874; d. 11 May 1898. He was graduated at the United States Naval Academy in 1895; promoted to ensign, 1 July 1897, and was detailed as inspector to the new torpedo-boat, Winslow, in November following. This boat went into commission the next month, and he was appointed her executive officer. In April 1898 the Winslow was assigned to the American fleet off the coast of Cuba, and on 9 May, while on blockading duty at the harbor of Cardenas, with the Wilmington and Hudson, drew the fire of several Spanish coast-guard vessels. All the American vessels escaped untouched. Two days afterward the three vessels undertook to force an entrance into the harbor, when they were fired on by Spanish gunboats. The Winslow was disabled, and with difficulty was drawn out of the range of the enemy's guns. The Wilmington then silenced the Spanish fire, and as the action closed, Ensign Bagley and four sailors on the

Winslow were instantly killed by a shell, he being the first American naval officer to fall in the war with Spain.

Baglioni, ba-lyō'ne, a historical family of Perugia in Italy. Perugia contained two parties—an aristocratic and a democratic one. The Baglioni belonged to the former. In the 12th century LUDOVICO BAGLIONI was appointed imperial vicar of Perugia by Frederic Barbarossa, who styles Baglioni his relative, as coming, like himself, from the ducal house of Swabia. In 1393, 70 Perugian gentlemen, and among them two Baglionis, were killed in a street fight by the populace, and the whole aristocratic party was expelled from the city. BRACCIO BAGLIONI, in the service of the Pope, defeated Francesco Sforza, near Lodi, in 1453, and was made lord of Spello by Sixtus IV. GIAN PAOLO BAGLIONI began life as a condottiere; then availing himself of the dissensions of his native state he obtained supreme power over it and made alliance with Pandolfo Petrucci, ruler of Sienna. He was driven out of Perugia by Cæsar Borgia in 1502. Returning in 1503, after the death of Alexander VI., he was banished again, in 1506, by Julius II. He then entered the service of the Venetians in the war of the league of Cambray. He resumed his old position as ruler of Perugia in 1513. Here he created so much scandal that Leo X., who at first passed over his usurpation, summoned him to Rome, threw him into the castle of St. Angelo, had him tried, and he was beheaded at Rome in 1520. MALATESTA and ORAZIO, his sons, recovered possession of Perugia after the death of Leo. Orazio turned condottiere in the service of France, and was killed in the Neapolitan expedition of 1528. Malatesta remained in Perugia until 1529, when he was driven out by the papal and imperial troops. He died at Perugia in December 1531. In the 16th century ASTORRE BAGLIONI served Charles V in Italy and on the coast of Tunis, and rose high in the favor of Pope Paul III., who restored to him his paternal estates. He then entered the Venetian service, and was governor of Famagosta in Cyprus when the Turks besieged it in 1570. After a brave defense he was obliged to capitulate on condition of being sent home to Venice with his garrison. But Mustapha Pasha, disregarding the terms, caused Baglioni and the other Venetian officers to be beheaded.

Baglivi, ba-lyē-vē, **Giorgio**, Italian physician: b. Ragusa, Sicily, 1669; d. Rome, 1707. He became a disciple of the celebrated physiologist and anatomist, Malpighi; was appointed professor of medicine in the College de Sapienza, Rome, by Pope Clement XI., and afterward became professor there of anatomy. In opposition to the system known as Galenism, in medicine, he founded that of solidism, which locates all disease in the solid portions of the human anatomy. His principal writings were published under the title of 'Opera Omnia Medico-Practica et Anatomica' (1704).

Bagnacavallo, bā'nya-ka-vāl'lō, **Bartolommeo Ramenghi**, Italian painter: b. 1484; d. 1542; called Bagnacavallo from the village where he was born. At Rome he was a pupil of Raphael and assisted in decorating the gallery of the Vatican. His best works are: 'Disputation of St. Augustine' and 'A Madonna and Child,' both in Bologna.

Bagnères de Bigorre, ba'nyār' dē be-gôr' (anciently *Aquensis Vicus*, *Aquæ Bigerronum*), a celebrated watering-place of France, in the département of Hautes Pyrénées, capital of the arrondissement of the same name, at the entrance of the valley of Campan, on the left bank of the Adour, 13 miles south-southeast from Tarbes. Its site is one of the most romantic in the Pyrenees. Well-cultivated slopes surround it on all sides, and are terminated in the distance by a mountain range, the most conspicuous summit in which is the Pic du Midi. The town is well built and contains several good squares and numerous spacious, handsome streets. Bagnères owes its chief celebrity to its baths, which are sulphurous and saline. The bathing establishment, called Fracasti, is very complete, and is the largest and most handsome building of the town. It stands at one of its extremities, immediately under Mount Olivet, and is approached by a long avenue of poplars winding through a verdant valley. The inhabitants depend chiefly on the baths, almost every house receiving lodgers; but the manufactures are of some importance. The chief of these are a kind of crape and a fine woollen gauze woven into shawls and scarfs. The springs here were known to and used by the Romans, and various ancient remains are still in existence. Pop. 6,907.

Bagnères de Luchon, ba'nyār' dē lü-shōn', a town of France, in the département of Haute-Garonne, one of the principal watering-places of the Pyrenees, having sulphurous thermal waters said to be beneficial in rheumatic and gouty complaints, nervous ailments, skin diseases, etc., and used chiefly as baths. The town is situated in the picturesque valley of Luchon, surrounded by hills covered with wood. The main street forms a splendid avenue, at the west end of which the large bathing establishment is placed. There is also a large and splendid casino building of recent erection, comprising a theatre, concert and ball rooms, etc., and containing a large-scale model of the Pyrenees, giving an excellent idea of the configuration of the range. The neighborhood exhibits some of the most interesting scenery of the Pyrenees. Visitors number from 30,000 to 40,000 annually, and are most numerous in the months of July and August. Resident pop. 4,000.

Bagni, ba'nye (Italian for "baths"), a name in Italy for various places which possess natural baths or thermal springs, distinctive appellations being appended to mark the particular locality. Thus there are Bagni San Giuliano, in the province of Pisa, and some four miles northeast of the city of that name; and Bagni di Lucca, in the province of Lucca, and about 13 miles northeast of the city of Lucca, one of the most frequented of the bathing places of Italy.

Bagot, Sir Charles, British diplomatist: b. 23 Sept. 1781; d. Kingston, Canada, 18 May 1843. He was the second son of William, first Lord Bagot. In 1807 he was appointed under-secretary of state for foreign affairs in the Canning administration; in 1814, minister to France; in 1820, ambassador at St. Petersburg; and in 1824, ambassador in Holland. On the death of Lord Sydenham he was made governor-general of the Canadas, which office he held till his demise.

BAGOT—BAHAMA BANK

Bagot, Richard, English bishop, brother of the preceding: b. 22 Nov. 1782; d. 15 May 1854. In 1829 he was made bishop of Oxford, and in 1845 he was promoted to the bishopric of Bath and Wells. During the Tractarian controversy he was violently assailed for his Puseyite predilections, and for his induction of the Rev. M. Bennett into the living of Frome. This had such an effect on Bishop Bagot that his intellect became disturbed.

Bagpipe, a well-known wind instrument, of high antiquity among various nations, and so long a favorite with the natives of the Highlands of Scotland that it may now be considered as their national instrument. The peculiarity of the bagpipe consists in the fact that the air producing the music is collected into a leathern bag, from which it is forcibly pressed into the pipes by the arm of the performer. The *chanter*, a pipe into which is inserted a reed for the production of the sounds by the action of the air from the bag, is perforated with holes like the German flute, which are stopped with the fingers. The other parts of the instrument, in the common Highland form, are three tubes or *drones*, which are also furnished with reeds. Two of the drones are in unison with D on the chanter, which corresponds with the lowest note of the German flute. The third drone, which is the longest, is an octave lower. The tuning of the bagpipe is accomplished by lengthening or shortening the tubes or drones, as may be required. Its compass is from the G of the treble stave to the A above it, but its scale is imperfect. The Highland bagpipe is a powerful instrument, and calls for great exertion of the lungs, the air being forced into the bag by a pipe held between the lips. The Irish bagpipe is smaller, softer in its notes, and is always played with bellows that force the air into the bag. It has a number of keys on the chanter and drones, and is a much more perfect instrument musically than the Highland A Lowland Scotch form of the bagpipe is also played with bellows. It is not known when the bagpipe first found its way into Scotland, but it is probable that the Norsemen first introduced it into the Hebrides, which islands they long possessed. In England it was common from Anglo-Saxon times, and is familiarly referred to by Chaucer and Shakespeare. The bagpipe is indeed of very ancient origin, as representations of it are to be found on Grecian and Roman sculptures; and it has long been well known among various eastern nations. In Italy to this day, or at least in certain parts of it, the bagpipe is still a popular instrument among the peasantry, but the Italian form of it is more simple than the Highland and Irish.

Bagratidæ, bāg-ra'tī-dē, or **Bagratians**, a line of kings and princes of Armenia that ruled in that country from the year 885 to the 11th century. After the seizure of Asia Minor by the Seljuks, some of the princes retained power as independent lords, holding the possession of mountain fastnesses. The dynasty ended with Leo IV., who was assassinated in 1342.

Bagration, bā-grā'te-ōn', **Peter**, Prince, Russian general, of the Georgian Bagradite family: b. about the year 1762; d. 7 Oct. 1812. He entered the Russian army in 1782 as a common soldier; and in a long military career rose to the highest grades, and gained a place among

those Russian generals the most celebrated for their stubborn, unyielding bravery. Having been created a lieutenant-general, he commanded the vanguard of the Austrian army at Austerlitz, under Prince Lichtenstein. In the Prussian campaign of 1807, his resistance made the battle of Eylau so terrible that even Napoleon shuddered at its bloody results. The same is said of him at the battle of Friedland. In 1808 he overran Finland, western Bothnia, and the Åland isles; in 1809 he fought at Silistria, and destroyed the Turkish force brought up from Adrianople to relieve that fortress. In 1812 he fought an unsuccessful battle with Davoust at Mohileff, but succeeded, nevertheless, in joining the Russian main army. He was mortally wounded at the battle of Mojaisk or Borodino, 7 Sept. 1812, just a month before he died.

Bagshaw, Edward, English author: date of birth unknown; d. 1662. He espoused at first the cause of the Puritans, but later became a Royalist, and sat in the parliament that Charles I. convened at Oxford; was taken prisoner by the Parliamentary army, and, during his detention, composed various books, the most important of which is 'The Right of the Crown of England as Established by Law.'

Bagshot Heath, a level tract in England, now used as a field for military manoeuvres. It is famous as the site of many highway robberies in the 18th century.

Bagstock, Major Joe, an apoplectic, gluttonous character in Dickens' novel, 'Dombey and Son.'

Bagworm, or **Basketworm**, a common caterpillar of a moth (*Thyridopteryx ephemeraformis*), found in large numbers throughout the northern part of the United States. The male has a dark body and light wings, but the egg-laying female is wingless. The larva lies head downward in a sac or case covered with bits of leaves (so that it looks like a basket), where it finally transforms, the worm-like female remaining in its case, while the male flies sluggishly about, and may be known by its hairy body and small transparent wings. When the young hatch (in May), they crawl on a leaf, gnawing little bits from the surface and fastening them together with a thread. They present a comical sight when the baskets are partly completed, walking about, tail in the air, with the body hidden in the case. As they grow older the body is entirely protected by the sac, which they drag about when in motion. These insects frequent the trees in city parks, especially junipers, in great numbers, and are apt to be detrimental to foliage unless destroyed by scraping off the cocoons. Certain small species occur on the orange in Florida, and others in the tropics. See FAGGOTWORM.

Bahadur, bā-hā'door, the last Great Mogul from the house of Tamerlane: b. 1767; d. 1862. When the British captured Delhi, he was taken prisoner, and sent to Rangoon. He was also a poet and wrote a number of songs.

Baha'ma Bank, Great and Little, shoals among the West India Islands; the former between 22° and 26° N., 75° and 79° W., having south and west the Bahama old and new channels. On it are the islands of Providence, Andros, and Exuma. The Little Bank, northwest of the foregoing, between 26° and 27° N., 77°

BAHAMA CHANNEL ; BAHAMAS

and 79° W., has on it the Great Bahama and Abaco Islands.

Baha'ma Channel, Old and New, two channels of the West Indies; the former separates the Great Bahama Bank and Cuba; the latter, also called the Gulf of Florida, is between the Great and Little Bahama Banks and Florida, and forms a part of the channel of the great Gulf Stream, which flows here at the rate of from two to five miles an hour.

Bahamas, The, or The Bahama Islands, were formerly known as the Lucayos, from the name of a tribe of aborigines inhabiting them at the time of their discovery by Columbus in 1492. The scene of the first landing was an island on the outer or Atlantic side of this group to which Columbus gave the name San Salvador. By the natives that island was called Guanahani, and it is now known as Watling Island. The total habitable area of the islands is small, but the extent of the group, including cays and rocks rising from banks near the surface of the water, is very great—nearly six degrees of latitude, and more than six degrees of longitude. Stretching through a total distance of 780 miles, these islands and banks form a barrier between the Atlantic and the eastern entrance to the Gulf of Mexico. To reach the Florida Strait, a large vessel must follow one of three channels: the Old Bahama, north of Cuba; the Florida, and the Providence. The last passes through the group above Nassau, the capital and only important city, an attractive place with about 10,000 inhabitants.

The researches of Prof. Agassiz have shown that the Bahamas are essentially different in geological formation from the Greater and Lesser Antilles, being "wind-blown piles of shell and coral sand,—once much more extensive than now,—whose areas have been restricted by a general regional subsidence of some 300 feet, so that much of their former surface now occurs as shallow banks beneath the water. Mr. Robert T. Hill says: "The islands are merely the exposed tips of a great submerged ridge, having an outline and configuration which would be crudely comparable to the island of Cuba if the latter were so submerged that its highest points merely reached the surface."

The Indian population having been carried away to the pearl fisheries of Panama, or to labor in the fields and mines of other Spanish colonies, the Bahamas remained deserted until, in 1629, an English settlement was begun in the island of New Providence. Twelve years later, Spain asserted her claim, based upon discovery without occupation. The English were expelled, but again attempted colonization; and Charles II., in 1680, actually granted the islands to six English noblemen and gentlemen. Early in the 18th century New Providence was twice raided by French and Spanish forces; and again it became a desert. Buccaneers of all nations made themselves at home, and held undisputed possession, until another English settlement was planted in 1718, and British troops assigned to its defense. Tory emigrants from the English colonies on the mainland at the time of the Revolution introduced slave labor and the cultivation of cotton—which did not thrive. New Providence was captured and held for a short time by the Amer-

icans under Commodore Hopkins in 1776; six years later it fell into the hands of the governor of Cuba, but was retaken by the loyalist Col. Deveaux before 12 months had passed. The rights of the old lord proprietors were purchased in 1787, the Bahamas becoming a possession of the British Crown, administered by a colonial government.

During the Civil War in the United States an enormous blockade-running trade swelled the imports of the islands from a little more than \$1,000,000 to upward of \$26,000,000; the exports from about \$800,000 to more than \$23,000,000—a period of prosperity both brief and unique. Violent storms and droughts have more than once brought ruin to the natural industries; the cultivation of small fruits, vegetables, oranges, pineapples, cocoanuts, etc., has been carried on at a disadvantage, owing to the tariff laws of the United States, and the remoteness of other markets. Other forms of agriculture have been attempted, with moderate success. Sponge-fishing is carried on extensively. At the eastern end of the group are the Turks and Caicos islands, which were separated politically from the Bahamas, and made a dependency of Jamaica in 1848. Grand Turk is the capital, and there the chief executive officer, or commissioner, resides. From these islands 1,500,000 bushels of salt are exported annually, and a large number of sponges are also gathered and exported. The total value of imports to all the islands is about \$825,000, the United States supplying nearly three fourths of that amount. Besides Turks and Caicos, the principal inhabited islands are: New Providence, with about 15,000 inhabitants; Abaco, Harbor Island, Eleuthera, Mayaguana, Ragged Island, Rum Key, Exuma, Long Island, Long Key, the Biminis, Great Bahama, Crooked, Acklin, Cat, Watling, Berry, and the Andros Islands. The inhabitants of Great Abaco are chiefly descendants of the American Tories, referred to above. Harbor Island has about 2,000 inhabitants, who are descendants of the buccaneers. Largest and most densely wooded are the Andros Islands.

From November to May the temperature ranges between 60° and 75° F.; in the summer months it varies from 75° to 85°. The climate, though subject to greater extremes of heat and cold than that of other groups in the West Indies, is agreeable and health-giving; and Nassau is a favorite resort for tourists in winter. The population (about 54,000), includes a large proportion of negroes, the natural increase among the descendants of former slaves being greater than among the descendants of the white settlers. There is little immigration. Good schools are maintained by the government, and by the Church of England. The administration of the islands is conducted by a governor, and an executive council. Members of the representative assembly, 29 in number, are elected by suffrage. There is a legislative council. From Nassau cables run to Florida and the Bermudas. A line of steamers connects the capital with London, and there is regular mail connection with New York and Florida.

Authorities—'Cuba and Porto Rico, with the Other Islands of the West Indies,' by Robert T. Hill; 'Amerika,' by Rudolf Cronau.

MARRION WILCOX,
Authority on Latin-America.

BAHAR — BAHRAICH

Bahar, *ba-har'*, province in India. See **BEHAR**.

Bahar, *ba-har'*, or **Barre**, the name of certain weights used in several places in the East Indies. They have been distinguished as the *great bahar*, with which are weighed pepper, cloves, nutmegs, ginger, etc.; and the *little bahar*, with which are weighed quicksilver, vermilion, ivory, silk, etc. But this weight varies much in different parts of the East, being in some places not much above 400 pounds, in others considerably over 500.

Bahawalpur, *ba-ha'-wal-poor'*, India, town and capital of a state of the same name in the Punjab, two miles from the Sutlej. It is surrounded by a mud wall and contains the extensive palace of the Nawab, a vast square pile with towers at the corners. It has underground rooms, which afford a more comfortable temperature in the warm season than the upper rooms. Silk goods are manufactured. Pop. about 14,000. The state has an area of 17,285 square miles, of which 10,000 is desert, the only cultivated lands lying along the Indus and Sutlej. Cultivation largely depends upon irrigation, which has been considerably extended in recent times, with a great increase to the state revenue. The chief crops are cereals, cotton, and indigo. The political relations between the British government and the state are regulated by a treaty concluded in 1838. No tribute is exacted from the Nawab. Pop. 720,700.

Bahia, *ba-ē'a*, or **São Salvador da Bahia**, so named because it is situated on a large harbor or bay, ranks, in population and importance among the cities of Brazil, next to Rio de Janeiro. It lies about 740 miles north of Rio, in lat. 13° 1' S, and lon 38° 32' W. Amerigo Vespucci visited this port on his voyage of exploration in 1503. Before 1763 Bahia was the capital of Brazil, and in the 16th century it was the scene of frequent conflicts between the Portuguese and the forces of other European nations (see **BRAZIL**). At present it is the capital of the state of Bahia, which has great natural resources in its mines and forests, as well as in fertile lands devoted largely to the cultivation of sugar-cane. The location of the city is picturesque, its upper portion being built on high ground several hundred feet above the sea-level. On the upper terraces stand churches, the cathedral, convents, a great theatre, the mint, and the governor's palace. Below, bordering the port, which has a fine lighthouse and is defended by several forts, are docks and warehouses where the products of the country,—coffee, sugar, cotton, dye-woods, tobacco, rum, hides, horns, and tallow,—are collected, to be shipped to all parts of the world. Bahia has an excellent public library, which was founded in 1811; its manufactures have received attention in recent years, and formerly it was the headquarters of the diamond trade before the mines of South Africa and southern Brazil were developed. The population is somewhat more than 200,000, with an annual increase of nearly 6,000.

MARRION WILCOX.

Bahia Blanca, *bā-ē'a blān'ka*, Argentina, an important seaport town in the state of Buenos Ayres. The town has an excellent harbor and

is the seat of a considerable foreign trade. The United States is represented by a consular agent. Pop. (1903) 11,600.

Bahia Honda, *ba-ē'a ōn'da*, a seaport of Cuba, on the coast of the Gulf of Mexico, and lying on a small bay, bearing the same name, which affords one of the best harbors on the island. The town and bay are about 50 miles west of Havana, being commanded by a small fort. There are mines of coal and copper in the vicinity. A short distance to the south are the sulphur springs of Aguacate.

Bahr, *bar*, **Johann Christian Felix**, German philologist. b. Darmstadt, 13 June 1798; d. 29 Nov. 1872; educated at Heidelberg Gymnasium and University, of which last he became ordinary professor of classical philology in 1823. His chief work is his 'History of Roman Literature' (1828; 4th ed. 1868-70), which is noted for its clearness and comprehensiveness. Three supplements to this work deal with the 'Christian Poets and Historians of Rome' (1836); the 'Christian-Roman Theology' (1837); and the 'History of Roman Literature in the Carolingian Period' (1840). His edition of 'Herodotus' (2d ed. 1855-61) is also noteworthy.

Bahr, *bar*, an Arabic word signifying sea or large river; as in Bahr-el-Huleh, the Lake Merom in Palestine; Bahr-el-Abiad, the White Nile, Bahr-el-Azrek, the Blue Nile, which together unite at Khartum.

Bahr-el-Ghazal, *bar'ēl-ga-zal'*, name of two rivers in central Africa: one flows from Lake Chad through a desert region; the other is formed by the union of several streams near the Congo Free State, and flows eastward through a very swampy region, and shortly after leaving Lake No unites with the Bahr-el-Jebel to form the White Nile. Its banks are apt to be very indefinite owing to inundations. In 1869 Schweinfurth explored the greater part of its basin. The head of steam navigation on the river is Meshra-er-Rek. The basin of these two rivers is a province of the same name. A settled government was established there on behalf of Egypt in 1878, but the Mahdist rebellion temporarily severed its connection with that country. Since the reconquest of the Egyptian Sudan by the British and Egyptian forces under Kitchener, however, the Bahr-el-Ghazal has been again brought under a settled administration. It is said to be rich in ivory, rubber, and timber, and suited for cotton growing. The Ubangi district of the French Congo lies to the west of the Bahr-el-Ghazal.

Bahr Yusuf, *bār yoo'sūf*, or **Bahr el Yusuf**, an artificial irrigation channel from the left bank of the Nile below Sint, to the Fayum; 270 miles long. According to Coptic traditions it was constructed during Joseph's administration.

Bahraich, *ba-rīch'*, a town of Hindustan, capital of Bahraich district, Faizabad division, Oudh. The town is in a flourishing state; it is drained and lighted, and carries on a good local trade. The chief edifice of interest is the shrine of Musand, a warrior and saint of the 11th century, which attracts both Hindu and Mohammedan pilgrims to the number of 150,000 annually. The American Methodist mission has a station and a school here. Pop. about 24,000.

Bahral, ba'rāl, or **Burrel**, a wild sheep (*Ovis nahura*) of the high plains of Tibet, which resembles a goat in appearance, although it has no beard. The rams carry large flattened and nearly smooth horns, which curve outward and backward, but do not curl. The general color is brown, becoming gray in winter, while the abdomen and insides of the legs and tail are white; a stripe along the sides and on each side of the face, the throat, and the front of the legs, are black, interrupted by white patches at the knees and above the hoofs. The females are plainer and have small horns. This animal, which is a favorite object of sport in Tibet, passes its whole time above the limit of forest growth, and clammers about the rocks in the manner of a goat rather than of a sheep. It is believed that these animals, which are often kept captive by the mountaineers, have influenced the Asiatic races of domestic sheep. Consult Lydekker, 'Royal Natural History,' Vol. II. (London 1895).

Bahrđt, bārt, **Karl Friedrich**, German theologian b Bischofswerda, Saxony, 25 Aug. 1741; d Halle, 23 April 1792; studied in Schulpforte and Leipsic, where he first showed his great talents. In 1762 he was appointed professor in the University of Leipsic. His works and his talents as a preacher procured him many admirers, but in consequence of immoral conduct he was obliged to quit that city in 1768. From this time he led an unsettled life. He was successively professor of theology and preacher in Erfurt (where he was made doctor of theology), in Giessen, Switzerland, and in Durkheim, but was obliged to leave each of these places on account of his severe attacks on the clergy and the heterodox views manifested in his writings and sermons, as well as on account of his irregular life. The Aulic Council declared him disqualified to preach or to publish unless he would revoke the religious principles advanced in his works. In 1779 he went to Halle, where he published his creed. It is thoroughly deistical, denying the miracles, and not insisting on the immortality of the soul. He lectured in Halle, but soon became involved in difficulties with the clergy; upon which he left the city, and established, in a neighboring vineyard, a public-house, where he had many customers, whose vitiated tastes and depraved habits he made no scruple of gratifying. Ultimately, in consequence of two works which he wrote, the patience of government was exhausted. He was brought to trial, condemned, and confined in the fortress of Magdeburg. Here he wrote his life. At the end of a year, having regained his liberty, he again opened his public-house at Halle, where he died.

Bahrein, ba-rān', or **Aval Islands**, a group of islands lying on the south side of the Persian Gulf, since 1867 under British protection. The principal island, usually called Bahrein, is about 27 miles in length and 10 in breadth. It is in general very flat and low, a mere shoal hardly 20 feet above sea-level; though in the centre there are hills 400 feet high. The soil is not fertile except in some places, and is often cultivated by means of irrigation. Excellent dates are produced. Fishing is an important industry, and the pearl-fishery here is famous. The inhabitants are a mixed race. The principal town is Manameh or Manama; pop. 25,000. The island of Moharrek,

separated from Bahrein by a strait two miles broad and only about three feet deep at ebb, is much smaller than it; but contains a town called also Moharrek, which is the present seat of government, and has a population of 22,000. The islands are governed by a sheikh. The total population is estimated at 70,000.

Baiæ, bi-ē, Italy, a place where wealthy Romans had their country-seats, the favorite abode of the Ambubaïæ and the Balatrones. It is now deserted, and interesting to the stranger only for the ruins of old baths, which are shown as temples, and for the remains of former palaces, visible beneath the waves of the sea. Baiæ owes its fame to its hot baths, and its situation on a most charming bay, secured by surrounding hills from the violence of the winds. The life of the Romans there was particularly luxurious and dissolute. It has now entirely lost its ancient position of importance.

Baidyabati, bād'ya-ba'tē, a town of Bengal, situated on the river Hughli, about 15 miles from Calcutta, with an important market for jute and other produce. Pop about 18,400.

Baif, ba-ē, **Jean Antoine de**, French poet b 1532; d. 1589; one of the literary league known as the 'Pleïade,' and the chief advocate of its plan of reducing French poetry to the metres of the classic tongues; also a spelling reformer, in favor of the phonetic system. His most meritorious works were translations of Greek and Roman dramas.

Baikal, bi-kal', a lake of Siberia, 360 miles long from southwest to northeast, and from 20 to 53 in breadth, interspersed with islands; lon 104° to 110° E; lat 51° 20' to 55° 20' N. It contains seals and many fish, particularly sturgeons and pikes. In the environs are several sulphurous springs, and in one part, near the mouth of the river Barguzin, it discharges a kind of pitch which the inhabitants purify. The water is sweet, transparent, and appears at a distance green, like the sea. It receives the waters of the Upper Angara, Selenga, Barguzin, and other rivers, but the Lower Angara is the only one by which it seems to discharge its waters. It is enclosed by rugged mountains, and the scenery is unusually magnificent. In summer the lake is navigated by steamboats, but it is frozen from November to April, and trade is carried on over the ice.

Baikie, bā'ki, **William Balfour**, English naturalist and traveler: b Kirkwall, Orknev, 1825; d 12 Dec 1864. He studied medicine at Edinburgh, and after receiving his degree entered the royal navy as assistant surgeon. He served in the Mediterranean, was assistant surgeon at Haslar Hospital in 1851-4, and was then appointed surgeon and naturalist to the Niger expedition, which was about to start for the exploration of this river. The death of the captain of the exploring vessel the *Pleiad*, left him in chief command, and he succeeded in reaching a point 250 miles higher up the river than had previously been attained. On a second expedition he was able to establish a settlement at the confluence of the Niger and Benue, and in a few years did much to spread civilization among the natives of the neighboring regions. He was author of 'Observations on the Haussa and Ffulde Languages,' and joint author with R Heddle of 'Mammalia and Birds Observed on the Orkney Islands.'

BAIKTASHI — BAILEY

Baiktashi, bîk-tà'shê. See **DERVISHES**.

Bail, in law, is the delivery of a person to another for keeping, and is generally used in reference to one arrested, or committed to prison, upon a criminal process, such person being said to be *bailed* when he is delivered to another (or is supposed to be so, but is simply set free from custody), who becomes his surety (to a greater or less amount according to the crime with which he is charged) for his appearance at court to take his trial. The person who thus becomes surety is said to *become bail*, and the amount itself is also called *bail*. Bail may generally be granted except in the case of treason. The word is not used as a plural.

When the punishment by the law of the United States is death, bail can be taken only by the supreme or circuit court, or by a judge of a district court of the United States. The proceedings attendant on giving bail are substantially the same in England and in all States of the United States. An application is made to the proper officer, and the bond or the names of the bail proposed filed in the proper office, and notice is given to the opposite party, who must except within a limited time, or the bail justify and are approved. If exception is taken, notice is given, a hearing takes place, the bail must justify, and will then be approved unless the other party oppose successfully; in which case other bail must be added or substituted. A formal application is in many cases dispensed with, but a notification is given at the time of filing to the opposite party, and unless exceptions are made and notice given within a limited time, the bail justify and are approved. If the sum in which the defendant is held is too large, he may apply for a mitigation of bail.

Bailen, bî-lân', a town of southern Spain, province of Jaen, with lead mines. Here the French met their first heavy defeat in the Peninsular war in 1808; 18,000 men surrendered to the Spaniards. Pop. 10,041.

Bail'ey, Florence Merriam, American writer on ornithology: b. 1863; educated at Smith College. Among her works are 'Birds Through an Opera Glass'; 'A-Birding on a Broncho'; and 'Birds of Village and Field.'

Bail'ey, Gamaliel, American journalist: b. Mount Holly, N. J., 3 Dec. 1807; d. 5 June 1859; was editor of the *Methodist Protestant* at Baltimore; with J. G. Birney founded the anti-slavery journal, the 'Cincinnati Philanthropist' (1836), the office of which was destroyed by a mob, though it continued to be published till 1847; after 1843 was also editor of a daily paper, *The Herald*. He established the well-known newspaper, the *Washington National Era* (1847), in which the famous novel, 'Uncle Tom's Cabin,' appeared first.

Bail'ey, Jacob Whitman, American scientist: b. Auburn, Mass., 29 April 1811; d. 26 Feb. 1857; was graduated at the United States Military Academy in 1832; and from 1834 till his death was professor of chemistry, mineralogy and geology at the Military Academy. He was the inventor of the Bailey indicator and of many improvements in the microscope, in the use of which he achieved high distinction; and he is regarded as the pioneer in microscopic investigation. He was president of the American Association for the Advancement of Science in

1857; held membership in the principal scientific associations of the world; and was author of numerous papers on the results of his researches.

Bail'ey, James Montgomery, American humorist: b. Albany, N. Y., 25 Sept. 1841; d. 4 March 1894; served in the 17th Connecticut regiment during the Civil War; returned to Danbury, founded the *Danbury News* in 1870. His humorous articles in this paper were widely quoted. He wrote 'Life in Danbury' (Boston 1873); 'Danbury News Man's Almanac' (1873); 'They All Do It' (1877); 'The Danbury Boom' (1880), etc.

Bail'ey, Joseph, American military officer: b. Salem, O., 28 April 1827; d. 21 March 1867; entered the Union army as a private in 1861, and signally distinguished himself in the Red River campaign under Gen. N. P. Banks, in 1864, by building a dam and deepening the water in the channel, which enabled Admiral Porter's Mississippi flotilla to pass the Red River rapids in safety and so escape the perilous situation. For this engineering feat, Bailey, who before entering the army was a plain farmer, was brevetted brigadier-general, promoted colonel, voted the thanks of Congress, and presented by the officers of the fleet with a sword and a purse of \$3,000. Subsequently, he was promoted to full brigadier-general, and was engaged on engineering duty till his resignation, 7 July 1865.

Bail'ey, Liberty Hyde, American horticulturist: b. South Haven, Mich., 15 March 1858; graduated at the Michigan Agricultural College in 1882; was associate to Dr. Asa Gray at Harvard University in 1882-3; professor of horticulture and landscape gardening in the Michigan Agricultural College in 1883-8; in the last year became professor of horticulture in Cornell University; and in 1903 was appointed director of the College of Agriculture at Cornell. He has contributed much to both the science and the practice of horticulture and has also done important educational work at Cornell. He was an associate editor of the revised edition of 'Johnson's Universal Cyclopædia' (1892-6), and editor of 'American Gardening'. He published a large number of technical works, including 'Annals of Horticulture,' 'Evolution of Our Native Fruits,' and 'Principles of Fruit Growing,' 'Text-book of Agriculture,' 'Nature Study Idea,' etc.

Bail'ey, Loring Woart, chemist and geologist: b. West Point, N. Y., 28 Sept. 1839. He graduated at Harvard in 1859, and in 1861 was appointed professor of chemistry and natural history in the University of New Brunswick, Fredericton, N. B., since which date he has also been connected with the geological survey of Canada. Besides his official reports he has published: 'New Species of Microscopical Organism from the Para River, South America' (1861); 'Mines and Minerals of New Brunswick' (1864); 'Geology of Southern New Brunswick' (1865); 'Elementary Natural History' (1887).

Bail'ey, Nathaniel (or **NATHAN**), English lexicographer: d. 1742. He was the author of an English dictionary, the best before that of Dr. Johnson. The first edition appeared in 1721 under the title of 'An Universal Etymological English Dictionary,' by N. Bailey; and

BAILEY — BAILIWKICK

it was soon republished in an enlarged form. Altogether some thirty editions of it appeared up to 1802. Dr. Johnson made use of an interleaved copy of it when drawing up his own dictionary. Bailey also published a spelling-book: 'All the Familiar Colloquies of Erasmus, Translated'; 'The Antiquities of London and Westminster'; 'Dictionarium Domesticum,' etc.

Bail'ey, Philip James, English poet: b. Nottingham, 22 April 1816; d. 6 Sept. 1902. He was educated first in his native city and afterward at Glasgow University; was called to the bar, but never practised. His best known poem, 'Festus,' was first published in 1839, and has passed through a very large number of editions, both in Great Britain and the United States. He is author of a few other poems and of one prose work; among the former are 'The Age' (1858), a satire, and 'The Angel World' (1850), now incorporated with 'Festus.'

Bail'ey, Samuel, English banker and writer on political and mental philosophy: b. Sheffield, 1791, d. 18 Jan. 1870. His first work was a volume of 'Essays on the Formation and Publication of Opinions' (1821), in which he ably defended the proposition that a man's opinions are independent of his will. His 'Essays on the Pursuit of Truth and on the Progress of Knowledge' (1829) are only less valuable. His many controversial books on questions of political economy are already almost forgotten, though these, as well as his pamphlets and treatises on political representation, primogeniture, and the like, are characterized alike by terse exposition and vigorous style. Not less interesting are his 'Review of Berkeley's Theory of Vision' (1842); 'Theory of Reasoning' (1851); and 'Letters on the Philosophy of the Human Mind' (1855-63). The third series of the last contains an able defense of utilitarianism, in which the author avows himself a thorough determinist.

Bail'ey, Solon Irving, astronomer: b. Lisbon, N. H., 29 Dec. 1854. He graduated from Boston University, 1881; and Harvard (A.M.), 1887. In 1889 he was sent to Peru to determine the best location for a southern station of the Harvard Observatory. Arequipa was selected, an observatory was built, and as associate professor of astronomy Prof. Bailey has had charge of the work there for eight years. In 1893 he established a meteorological station on the summit of El Misti, by far the highest scientific station in the world. His scientific writings have been issued in the 'Annals of Harvard College Observatory.'

Bail'ey, Theodorus, American naval officer: b. Chateaugay, N. Y., 12 April 1805; d. 10 Feb. 1877; entered the navy in 1818; served on the western coast of Mexico during the Mexican war; commanded the frigate Colorado, of the western Gulf blocking squadron, in 1861-2; and in the last year commanded the right column of Admiral Farragut's squadron in the passage of forts St. Philip and Jackson, and led the fleet at the capture of the Chalmette batteries and the city of New Orleans. In 1862-5 he commanded the east Gulf blockading squadron. He was commissioned rear-admiral and retired in 1866.

Bail'ey, Vernon, American scientist: b. Manchester, Mich., 21 June 1863; received a university education and in 1900 was chief field naturalist of the United States Biological Survey. Among his publications are 'Spermophiles of Mississippi Valley,' 'Revision of Voles of the Genus *Eutamias*,' 'Mammals of District of Columbia,' etc.

Bail'ey, William Whitney, American botanist: b. West Point, N. Y., 22 Feb. 1843. He was educated at Brown and Harvard, having been a pupil of Prof. Asa Gray. In 1867 he was botanist of the United States Geological Survey of the 40th parallel; in 1867-9 assistant librarian of the Providence Athenæum. He was appointed instructor in botany at Brown University in 1877, and became professor there in 1881. He has published 'Botanical Collector's Handbook' (1881), and contributed to several periodicals.

Bailey, Willis T., American statesman: b. Carroll County, Ill., 12 Oct. 1854. He was educated at the University of Illinois. In 1873 he removed to Nemaha County, Kan., and engaged in farming and stock-raising. In 1888 he was elected to the State legislature and was sent to Congress in 1899. He was elected governor of Kansas on the Republican ticket in 1903.

Bail'ie, or Baillie, a municipal officer or magistrate in Scotland whose jurisdiction extends to breaches of the peace, drunkenness, petty thefts, and like offenses. They sit and vote in the city councils, like other members, and are subject to the ordinary rules of retirement.

Bail'iff, a name which was introduced into England with William I., and came to be applied to various officials representing or acting for the king. He is essentially a person intrusted by a superior with power of superintendence. In the United States the word bailiff has no precise meaning. The term is most frequently used to denote a court officer whose duty it is to take charge of juries and wait upon the court. In England an officer appointed for the administration of justice in a certain bailiwick or district. The sheriff is the king's bailiff, whose business it is to preserve the rights of the king within his "bailiwick" or county. (1) The governor of a castle belonging to the king. (2) A sheriff's officer. Bailiffs are either bailiffs of hundreds or special bailiffs. (a) Bailiffs of hundreds are officers appointed by the sheriff over the districts so called, to collect fines, summon juries, to attend the judges and justices at the assizes and quarter sessions, and to execute writs and process. (b) Special bailiffs are men appointed for their adroitness and dexterity in hunting and seizing persons liable to arrest. They assist the bailiffs of hundreds in important work for which the latter have no natural aptitude or acquired skill. Special bailiffs being compelled to enter into an obligation for the proper discharge of their duty are sometimes called bound bailiffs, a term which the common people have corrupted into a more homely appellation. (Blackstone's 'Commentaries,' book I., chapter ix.)

Bail'iwick, the jurisdiction of a bailiff, from *bailie* and *wick* (*vicus*), a town or village. In the United States it generally refers to a county, or in a jocular way is applied to any territory or place in which a person has authority.

BAILLAIRGE — BAILIE

Baillairge, ba-yārzĥ', Charles P., Canadian architect and civil engineer: b. Quebec, 27 Sept. 1826. Among his best known works as an architect are the Laval University, the asylum and churches of the Sisters of Charity and Good Shepherd, the Music Hall, the new jail, Dufferin Terrace, the aqueduct bridge over the St. Charles, and the Monument aux Braves de 1760, all in the city of Quebec. In 1863-5 he was joint architect and engineer with Messrs. Fuller and Page, of the parliamentary and departmental buildings in Ottawa. He is a member of the Royal Academy of Arts, Fellow of the Royal Society of Canada, and a past president of the Quebec Association of Architects. He has received many honors and diplomas from his own and other governments, and has published a large number of important works, including 'Plane and Spherical Geometry and Trigonometry' (1863); 'Key to the Stereometrical Tableau' (1870); 'Homonymes Français' (1891); 'English Homonyms' (1891), etc.

Baillarger, ba'yār-zhā', Jules Gabriel, French physician: b. 1809; d. 1891. He made a specialty of mental and nervous diseases and in 1843 joined with Longet and Cerise to establish a review especially devoted to these subjects, known as the 'Annales Médico-psychologiques du Système Nerveux'. In 1849 he received the medal of the Legion of Honor; in 1842 he received a prize from the Academy of Music for his essay on 'Des Hallucinations.'

Baillet, ba-yā', Adrien, French writer: b. Neuville, 13 June 1649; d. 21 Jan. 1706. He was first a teacher and then a priest, but abandoned these pursuits for study and composition. So absorbed was he in intellectual pursuits, that he passed days often in undress, with but a single meal, and the smallest amount of sleep. His first publication was entitled 'Judgments of the Learned upon the Principal Works of Authors,' a book of criticism which taught better rules than it illustrated. He also produced a book on 'Devotion to the Holy Virgin,' the lives of the saints, which extended to four volumes, and a life of Descartes.

Bailleul, ba-yel', a French town, in the department of the Nord, near the Belgian frontier, about 19 miles west of Lille. It has manufactures of woolen and cotton stuffs, lace, leather, etc. Population, about 13,600. A village of the same name in the department of Orne gave its name to the Baliol family.

Bail'ie, Lady Grizel, Scotch poet: b. Redbraes Castle, 25 Dec. 1665; d. 6 Dec. 1746; daughter of the first Earl of Marchmont; married George Bailie in 1692; published a large number of songs in Ramsay's 'Miscellany,' and other collections; the best known is 'Werena My Heart Licht, Isvad Dee.'

Bail'ie, Harry, the proprietor of the Tabard Inn, who acts as chairman of the meeting of the pilgrims in Chaucer's 'Canterbury Tales.'

Bail'ie, Joanna, Scotch author: b. Bothwell, near Glasgow, 11 Sept. 1762; d. 23 Feb. 1851. She removed in early life to London, where in 1798 she published the first volume of her well-known 'Plays on the Passions,' in which she attempted to delineate the stronger passions by making each passion the subject

of a tragedy and a comedy. These plays were not well adapted for the stage, but gave Miss Bailie a very extended reputation. Her first volume was followed by a second in 1802, a third (of miscellaneous plays) in 1804, and a fourth in 1812. Other plays appeared in 1836, and a complete edition of her whole dramatic works in 1850. The only plays performed on the stage were a tragedy entitled the 'Family Legend,' which was brought out at the Edinburgh Theatre in 1810 under the patronage of Sir Walter Scott, and had a run of 14 nights, and one of the plays on the passions entitled 'De Montfort,' which was brought out by John Kemble, and played for 11 nights, though an attempt to revive it at a later period failed. Miss Bailie also wrote songs and miscellaneous poems. All her productions are full of genius. The language is simple and forcible, the female portraits are particularly beautiful, and great knowledge of the human heart is displayed in the delineations of character. She was an intimate friend of Sir Walter Scott, who greatly admired her writings, and her home was frequented by many of the prominent authors of the day.

Bail'ie, Matthew, Scotch physician and anatomist: b. Lanarkshire, Scotland, 27 Oct. 1761; d. 23 Sept. 1823, brother of Joanna Bailie; educated at the University of Glasgow and Oxford. While at Oxford he began his medical and anatomical studies under his maternal uncles, the celebrated William and John Hunter, then lecturers in London. In 1787 he was elected one of the physicians of St. George's Hospital, and held that office for 13 years. In 1789 he took the degree of M.D., and was admitted a fellow of the College of Physicians. He very soon stood at the head of his profession, and in 1810 was made physician to the king by George III. He published 'The Morbid Anatomy of Some of the Most Important Parts of the Human Body'; also wrote 11 essays in the 'Transactions of the Society for the Promotion of Medical and Surgical Knowledge,' and 7 papers in the Medical Transactions, published by the London College of Physicians.

Bail'ie, Robert, Scotch Presbyterian clergyman: b. Glasgow, 1599; d. 1622; educated at the University of Glasgow. In 1638 he sat in that famous general assembly which met in Glasgow to protest against the thrusting of Episcopacy on an unwilling people. In 1649 he was chosen by the Church to proceed to Holland, and to invite Charles II. to accept the covenant and crown of Scotland. He performed his mission skilfully; and, after the Restoration, through Lauderdale's influence, he was made principal of Glasgow University.

Bail'ie, Robert, Scotch patriot of the reign of Charles II.; d. 24 Dec. 1684. He first came into notice in 1676 through his rescue of a brother-in-law, the Rev. Mr. Kirkton, from the clutches of Archbishop Sharp's principal informer. In 1683 he took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time, however, he entered into correspondence with the heads of Monmouth's supporters in London, Russell and Sidney, and subsequently repaired there to concert measures for securing ade-

BAILLIE OF JERVISWOOD — BAIN

quate reforms. On the discovery of the Rye-house plot, he was arrested and sent to Scotland. Accused of conspiring against the king's life, and of hostility to monarchical government, he was tried at Edinburgh and condemned to death upon evidence at once insignificant and illegal. The sentence was carried into execution on the very day that it was passed.

Bail'lie of Jerviswood. See BAILLIE, ROBERT.

Baillot, ba-yō', Pierre Marie François de Sales, French violinist b. Passy, 1771, d. 15 Sept. 1842. He was a professor in the conservatory; traveled in Russia, Belgium, Holland, and England, and was considered without a rival. His style was severely classical, as distinguished from that introduced by Paganini.

Baillou, ba-yo', Guillaume de, French physician: b. 1538; d. 1616; became physician to the Dauphin in 1601; was author of several works, including 'Adversaria Medicinalia,' and is considered the first exponent of the nature of croup.

Bailly, ba-ye', Antoine Nicolas, French architect: b. 6 June 1810; d. 1 Jan 1892; was appointed to an office under the city government of Paris in 1834; in 1844 was made architect to the French government, and received the cross of the Legion of Honor in 1853. The Molière Fountain and the Tribunal of Commerce in Paris, and the reconstruction of the Cathedral of Digne, are his work.

Bailly, ba-ye', Jean Sylvain, French astronomer, statesman, and historian: b. Paris, 15 Sept. 1736; d. 12 Nov. 1793. Leaving the art of painting, to which he was educated, he pursued poetry and belles-lettres, until his acquaintance with La Caille, when he turned his attention to astronomy, and calculated the orbit of the comet of 1759. In 1763 he was admitted to the Academy of Sciences; in 1766 he published his treatise on Jupiter's satellites, which also contains a history of that section of astronomy. In 1771 he published a valuable and interesting treatise on the light of the satellites. Later he wrote also a history of astronomy. In 1784 he was chosen secretary of the academy, also admitted to the French academy, and the next year admitted to the Academy of Inscriptions; a rare thing for one person to belong to the three academies. He espoused the democratic cause in the Revolution, was elected from Paris, in 1789, first deputy of the *tiers état*, and was chosen president of the assembly. In July 1789 he was chosen mayor of Paris and discharged his duties during 26 months of a most trying and dangerous period with great firmness and wisdom. Losing his popularity by repressing riots and defending the queen, he gave up public life, and lived in retirement, till seized by the Jacobins and brought to Paris, where he was condemned as a conspirator and executed. Several posthumous works of his have appeared; the most noted are an 'Essay on the Origin of Fables and Ancient Religions,' and his 'Memoirs of an Eye-witness from April to October 1789.'

Bailly, ba-ye', Joseph A., French sculptor: b. Paris, 1825; d. 15 June 1883; removed to Philadelphia, Pa., in 1850; and produced 'Adam and Eve,' 'Eve and Her Two Children,'

and the marble monument of Washington in front of the State house (1869).

Bail'ment, in law, is the delivery of a chattel or thing to another to keep, either for the use of the bailor or person delivering, or for that of the bailee or person to whom it is delivered. A bailment always supposes the subject to be delivered only for a limited time, at the expiration of which it must be redelivered to the bailor; and the material inquiries in cases of bailment, relate to the degree of responsibility of the bailee in regard to the safe-keeping and redelivery of the subject of the bailment. This responsibility will depend, in some degree, upon the contract on which the bailment is made. If a thing is delivered to the bailee to keep without any advantage or use to himself, or any compensation, but merely for the benefit of the bailor, he is answerable only for gross negligence; but if the bailment is for the mutual benefit of both parties, the thing must be kept with the ordinary and usual care which a prudent man takes of his own goods; but if it be delivered for the benefit of the bailee only, he must exercise strict care in keeping it, and will be answerable for slight negligence. A special agreement is made in many cases of borrowing or hiring, specifying the risks assumed by the borrower or hirer; and in such case his obligations will be determined by his stipulations.

Bail'y, Edward Hodges, English sculptor: b. Bristol, 10 March 1788, d. 22 May 1877. He was brought up with a view to a mercantile career; but ere long gained considerable success as a modeler in wax. He became a pupil of Flaxman in 1807, gained the academy gold medal in 1811 for his 'Hercules Restoring Alcestis to Admetus,' and was elected a member of the Royal Academy in 1821. His principal works are 'Eve at the Fountain'; 'Eve Listening to the Voice'; 'Maternal Affection'; 'Girl Preparing for the Bath'; 'The Graces'; etc. The bas-reliefs on the south side of the marble arch, Hyde Park, the statue of Nelson on the Trafalgar Square monument, and many statues of distinguished men, were executed by him. In 1863 he was placed on the honorary retired list of the Royal Academy.

Bail'y, Francis, English astronomer: b. Newbury, in Berkshire, 1774; d. 1844; entered a London house of business, and traveled two years in America; then settled in London as a stockbroker and published several works on the doctrine of life annuities and insurance. On retiring from business with an ample fortune in 1825 he turned his attention particularly to astronomy, and became one of the founders of the Astronomical Society; improved the nautical almanac, and investigated and described the phenomenon called Bail'y's beads (q.v.). Besides many astronomical papers he wrote a 'Life of Flamsteed.'

Bail'y's Beads, a phenomenon attending eclipses of the sun, the unobscured edge of which appears discontinuous and broken immediately before and after the moment of complete obscuration. It is classed as an effect of irradiation.

Bain, Alexander, Scottish electrician: b. Watten, Caithness, 1810; d. 1877. He went to London and began a series of electrical experi-

BAIN — BAINES

ments in 1837; and invented electric fire-alarm and sounding-apparatus, and the automatic chemical telegraph, by which high speed telegraphy was for the first time made possible.

Bain, Alexander, Scotch writer on mental science and education; b. Aberdeen, 1818; d. 18 Sept. 1903; educated at Marischal College and University there. In 1840 he became deputy teacher of the moral philosophy and natural philosophy classes in Marischal College; between 1845 and 1860 he was professor at the Andersonian College, Glasgow, assistant secretary to the Metropolitan Sanitary Committee and the general board of health, and examiner in mental and moral science in the University of London, and for the India civil service examinations. From 1860 till 1880 he occupied the chair of logic and English in the University of Aberdeen (formed by the union of the two universities of Marischal College and of King's College), and in 1881, also in 1884, was elected its lord rector. He is the author of numerous works on mental and moral philosophy, the two most important being 'The Senses and the Intellect' (1855), and 'The Emotions and the Will' (1859). These contain a comprehensive examination of mental phenomena from the standpoint of the experiential school, and have run through several editions. Among his other works are 'The Study of Character' (1861); 'Mental and Moral Science' (1868); 'John Stuart Mill: a Criticism, with Personal Recollections' (1882); 'Logic, Deductive and Inductive' (1870); 'Higher English Grammar' (1863); 'Manual of English Composition and Rhetoric' (1866); 'Education as a Science' (1879).

Bainbridge, Edmond, English military officer: b. 1841. He was educated at the Royal Military Academy, joined the army in 1860, and became colonel in 1893. Since 1876 he has been connected with the ordnance branch of the military service, serving also as instructor in the School of Gunnery; and, becoming, in 1899, director-general of the English ordnance factories.

Bainbridge, John, English astronomer and mathematician: b. Ashby-de-la-Zouch, in Leicestershire, 1582; d. 1643. He studied at Cambridge; set up a grammar-school in his native place, and at the same time practised physic, devoting his leisure to the science of mathematics. His 'Description of the Comet of 1618' was the means of introducing him to Sir Henry Savile, who had founded an astronomical lecture at Oxford, and who in 1619 appointed Dr. Bainbridge to the professorship. He died while engaged in publishing corrected editions of the works of the ancient astronomers, an undertaking which was one of the duties enjoined on him as Savilian professor. His other published works are 'Procli Sphæra et Ptolemæi de Hypothesibus Planetarum,' together with 'Ptolemæi Canon Regnorum' (1620); and 'Canicularia: A Treatise on the Dog Star' (1648).

Bainbridge, William, American naval officer: b. Princeton, N. J., 7 May 1774; d. 28 July 1833. He entered the merchant service and became captain within four years. In 1798, when the United States navy was organized, he

was made lieutenant and given command of the schooner *Retaliation*. He was captured by the French and kept a prisoner for several months, and on his return to the United States was placed in command of the *Norfolk* and subsequently appointed to the command of the frigate *George Washington*, which was ordered to take tribute to Algiers. The dey of Algiers demanded that Bainbridge convey an Algerian ambassador and valuable presents to Constantinople, and Bainbridge was forced to comply to avoid war and the destruction of the unprotected trade in the Mediterranean. The United States government fully approved the course he had pursued. He was soon employed in the Mediterranean again in command of the frigate *Essex*, and afterward upon the declaration of war against the United States by Tripoli, was appointed to the frigate *Philadelphia*, one of the vessels of the squadron sent against that power, under the command of Commodore Edward Preble. On 26 Aug. 1803, he captured the Moorish frigate *Meshboa*, but was himself taken prisoner with his officers and men in October of that year. While pursuing one of the enemy's vessels, the *Philadelphia* ran aground; every possible effort was made to float her, but she was soon surrounded by gunboats from Tripoli, about three miles distant, and Capt. Bainbridge was compelled to surrender, having first taken such measures as it was thought would ensure the final loss of the ship. He remained with his associate prisoners in Tripoli until the conclusion of peace, which took place 3 June 1805. On his return a court of inquiry for the loss of the *Philadelphia* gave him honorable acquittal. His next service afloat was in the War of 1812, when he was appointed, with the rank of commodore, to the command of a squadron, consisting of the *Constitution* (his flagship), *Essex*, and *Hornet*, and sailed from Boston 25 Oct. for a cruise. On 26 Dec. off San Salvador, while separated from the rest of his squadron, it was his good fortune to fall in with and capture H. B. M. frigate *Java*. In 1815 he was appointed to the command of a squadron of 20 sail, intended to act against Algiers, then at war with us, but peace was concluded before it reached the Mediterranean. In 1819 he again commanded in the Mediterranean, and returned from this, his last service afloat, in 1821. From this time until his death he was almost constantly employed in important shore service, commanding at different times the navy yards at Boston and Philadelphia, and holding the position of president of the board of navy commissioners. As an officer he had few superiors. Though ardent in his temperament, he was cool in danger, and always had the confidence of those under his command. His system of discipline, though rigid, was always consistent and just, and he was remarkable for paying the greatest attention to the formation of his young officers.

Bainbridge, Ga., a town and county-seat of Decatur County, situated on the Flint River, 236 miles west of Savannah. It is in a cotton and tobacco region, and has various manufactures: turpentine distilleries, lumber mills, etc. It is the seat of the Georgia Southern Military College. Pop. (1904) 5,000.

Baines, Thomas, English artist and explorer: b. Norfolk, 1822; d. 8 May 1875. In

BAINI — BAIRD

1842 he went to Cape Colony, whence he accompanied the British army in the Kaffir war as artist. He afterward went with Gregory's party to explore northwest Australia; with Livingston to the Zambesi; with Chapman's expedition to the Victoria Falls; and finally headed an expedition to the gold fields of Tati. Everywhere he made large numbers of sketches. A handsome folio of colored lithographs from his drawings at Victoria Falls was published in 1865. His last journey among the Kaffirs was very carefully mapped out and sketched. His writings are 'Explorations in Southwestern Africa' (1864); 'The Gold Regions of Southeastern Africa' (1877).

Baini, ba-é'ne, **Giuseppe**, Italian musician: b. Rome, 1775; d. 1844. He was director of the Pope's choir from 1814 till his death. The severe gravity and profound science of his compositions contrasted strongly with the careless style and shallow dilettanteism of most of his compeers; but it was by his historical researches that Baini secured for himself a prominent place in musical literature. His principal work is his 'Life of Palestrina' (1828).

Bairaktar, bi'rak-tar' (more correctly, BAIRAK-DAR), signifying "standard-bearer," the title of the Grand Vizier Mustapha: b. 1755, d. 15 Nov. 1808. When he was pasha of Rustchuk in 1806, he fought with some success against the Russians, and after the revolt of the Janissaries in 1807, by which Selim III was deposed from the throne in favor of Mustapha IV., he marched his troops to Constantinople, deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II, sultan on 28 July 1808. Bairaktar was now appointed grand vizier, and endeavored to carry out Selim's reforms, and to strengthen the regular army. His chief object was the annihilation of the Janissaries; but they rebelled, and, with the support of the fleet, attacked the seraglio 15 Nov. 1808, and demanded the restoration of Mustapha IV. Bairaktar defended himself bravely, but when he saw that flames threatened to destroy the palace, he strangled Mustapha, threw his head to the besiegers, and killed himself.

Bairam, bi-ram' or **Beiram**, bi'ram, a Mohammedan feast, immediately following the Ramadan or Lent (a month of fasting), and last three days. This feast begins, like the Ramadan, as soon as the new moon is announced by the persons appointed for that purpose, and during the course of 33 years makes a complete circuit of all the months and seasons, since the Turks reckon by lunar years. It is the custom at this feast for inferiors to make presents to their superiors, a custom formerly extended even to the Europeans. The Sultan of Turkey is also accustomed to distribute favors and presents. Seventy days after this first great Bairam begins a second—the lesser Bairam. They are the only two feasts whose celebration is prescribed by the Mohammedan religion.

Baird, Absalom, American military officer: b. Washington, Pa., 20 Aug. 1824. He was graduated from the United States Military Academy and assigned to the artillery in 1849. He was commissioned brigadier-general of volunteers, 28 April 1862, and brevetted major-general, 1 Sept. 1862, for his conduct in the At-

lanta campaign. On 13 March 1865, he was brevetted major-general, United States army, for meritorious services in the field during the war. He was continually in the field from the Manassas campaign, in 1861, till after the surrender of Gen. Johnston's army in 1865. He was staff inspector-general from 1885 to 1888, when he was retired.

Baird, Andrew Wilson, English military engineer: b. Aberdeen, Scotland, 26 April 1842. He became a colonel in the Royal Engineers Corps in 1893; was special assistant engineer of the harbor defenses of Bombay, in 1864; assistant field engineer of the Abyssinian expedition in 1868, and, for nearly 20 years thereafter, employed on the great trigonometrical survey of India. His services were rewarded with numerous official commendations, medals, and decorations; and he has published a number of important works on his labors in India.

Baird, Charles Washington, American historian and religious writer, son of Robert Baird: b. Princeton, N. J., 28 Aug. 1828; d. 10 Feb. 1887. He was a graduate of Union Theological Seminary, and pastor in Brooklyn in 1859, and in Rye, N. Y., 1861. Besides works on the Presbyterian liturgies (which he was the first to collect and investigate) and local histories, he wrote 'History of the Huguenot Emigration to America' (2 vols. 1885), a work especially interesting to the genealogist.

Baird, Sir David, British general: b. Newbyth, Scotland, 6 Dec. 1757; d. 18 Aug. 1829. He entered the English army in 1772, and going to India distinguished himself at a disastrous engagement at Peramboucum, 10 Sept. 1780, in which the small British force engaged was nearly cut to pieces after surrendering. His life was spared, but he was kept prisoner for four years. He attained the rank of major in 1787, and in October 1789, obtained leave of absence and returned to Britain. In 1791 he joined the army under the Marquis Cornwallis, and as commander of a brigade of Sepoys he was present at the siege of Seringapatam, in 1791 and 1792; and likewise at the storming of Tippee Saib's lines in the Island of Seringapatam. In 1793 he commanded a brigade of Europeans, and was present at the siege of Pondicherry. On 9 May 1799, he commanded the storming party at the assault of Seringapatam; when, in requital of his brilliant services, he was presented by the army, through the commander-in-chief, with the state sword of Tippee Saib. In 1800 he had a command in Egypt, and with the increased rank of lieutenant-general commanded an expedition which sailed in October 1805, for the Cape of Good Hope, where he defeated the Dutch army and received the surrender of the colony. After a short period of service in Ireland Sir David sailed in command of an armament of 10,000 men for Corunna to assist Sir John Moore. Moore was killed in the battle of Corunna and Sir David succeeded to the chief command; he received for the fourth time the thanks of Parliament, and was created a baronet. In 1814 he was promoted to the rank of general, and in 1819 became governor of Kinsale, next year commander of the forces in Ireland, and in 1827 of Fort George in Scotland. See Hook, 'Life of Sir David Baird' (1832).

BAIRD — BAJAZET

Baird, Henry Carey, American political economist and publisher, nephew of Henry C. Carey: b. Bridesburg, Pa., 1825. In 1875 he became a leader of the Greenback party and was nominated for mayor of Philadelphia. A protectionist, his economical views generally are similar to those of his distinguished uncle. He has written many economic pamphlets.

Baird, Henry Martyn, American author: b. Philadelphia, Pa., 17 Jan. 1832. He was graduated from the University of the City of New York in 1850, and, after spending some years in Europe, took a course in theology at Union and Princeton. In 1859 he was appointed professor of the Greek language and literature in the University of the City of New York. His principal works are a 'History of the Rise of the Huguenots' (1879); 'The Huguenots and Henry of Navarre' (1886); and 'The Huguenots and the Revocation of the Edict of Nantes' (1895).

Baird, Julian William, American chemist: b. Battle Creek, Mich., 14 Feb. 1859. He was graduated from the University of Michigan in 1882; was instructor in chemistry and in charge of the qualitative analysis and assaying in Lehigh University, 1883-6; and became professor of analytical and organic chemistry in the Massachusetts College of Pharmacy, Boston, in 1886, and its dean, in 1887.

Baird, Robert, American historian b. Fayette County, Pa., 6 Oct. 1798; d. Yonkers, N. Y., 15 March 1863. He was graduated from Jefferson College; and published 'History of the Waldenses, Albigenses, and Vaudois,' 'History of the Temperance Societies' (1836); 'Religion in America' (1844); 'Protestantism in Italy' (1845); etc. He was corresponding secretary of the American and Foreign Christian Union (1849-55, 1861-3).

Baird, Spencer Fullerton, distinguished American naturalist: b. Reading, Pa., 3 Feb. 1823; d. 19 Aug. 1887. He became professor of natural sciences at Dickinson College, Carlisle, Pa., 1845; assistant secretary Smithsonian Institution, 1850; United States commissioner of fish and fisheries, 1871; secretary of the Smithsonian Institution, 1878, and founder of the National Museum. Among his more important works are a 'Catalogue of North American Reptiles' (1853); 'Birds of North America' (with Cassin and Lawrence, 1860); 'Mammals of North America' (1858); 'History of North American Birds' (with Brewer and Ridgeway, 1874-84), etc. His work had a great lasting and beneficial influence on natural history in the United States.

Baireuth, *bī-roit*, or **Bayreuth**, a city of Bavaria, on the Red Main, 41 miles northeast of Nuremberg. The principal edifices, besides churches, are the old palace now occupied by public offices, the new palace, with garden and park open to the public; the opera house, a gymnasium, and the national theatre, constructed after the design of the composer Wagner, and opened in 1876 with a grand performance of his 'Ring of the Nibelungen.' Baireuth fell to the burgrave of Nuremberg in 1248, and after many vicissitudes was ceded to Bavaria in 1810. The chief industries are cotton-spinning, and weaving, sugar-refining, brewing, etc. Pop. (1900) 29,000.

Baiter, *bī'ter*, **Johann Georg**, Swiss philologist: b. Zurich, 31 May 1801; d. 10 Oct. 1877. He was professor in the University of Zurich, and from 1849 to 1865, director in the gymnasium there. He published, alone and with Sauppe, Orelli, and others, various editions of the classics, 'Panegyrics of Socrates,' 'Ciceronis Scholastæ,' 'The Attic Oratoris' (1839-50), etc.

Ba'ius, or **De Bay, Michael**: b. 1513, at Melin, near Ath, in Hainaut, educated at Louvain, in 1551; made professor of Scripture at this university in 1563, sent by the king of Spain to the Council of Trent, was one of the greatest theologians of the Roman Catholic Church in the 16th century. He founded systematic theology directly upon the Bible and the Christian fathers, leaving the scholastic method. He studied specially the writings of St. Augustine and had his own interpretations of that father. The doctrines that the human will, when left to itself, could only sin; that even the mother of Jesus was not free from hereditary and actual sin; that every action which did not proceed from pure love of God was sinful; and that no penance was effectual for the justification of the sinner, but everything was to be attributed solely to the grace of God, through Christ — caused him to be denounced as a heretic by the Scotists. His views were condemned by Pius V in 1567, and some dispute arising about the meaning of this bull, it was confirmed by Gregory XIII. and entrusted to the Jesuit Cardinal Toletus to deliver to Baius. Baius submitted; yet the opposition still continued, as did also his defense of some of his interpretations of Augustine in his lectures; and as the theological faculty at Louvain was entirely in his favor, he not only remained in the quiet possession of his dignities, but was also appointed dean of St. Peter's in 1575, and in 1578 chancellor of the university; nay, the king of Spain conferred upon him the office of inquisitor-general in the Netherlands. He died in 1589, and left the reputation of great learning, pure morals, and a rare modesty. His interpretations of Augustine, which were called *Baianism*, were adopted by the Jansenists, as the precursor of whom he is to be regarded, and were defended by them against their Jesuit opponents. His doctrine of pure undivided love to God has also been adopted by the Quietists. His writings, mostly polemical, were published at Cologne (4to. 1696).

Baize, a coarse woolen fabric with a rough nap, now generally used for linings, usually green or red in color.

Baja, *bō'yō*, a Hungarian market town situated on the Danube, 90 miles south of Budapest. It has important manufactures of alcohol and shoes and is celebrated for its annual swine fair, and its trade in grain and wine. Pop. (1890) 19,500.

Bajada Del Parana, *ba-hā'da děl pä'ra-nā'*. See PARANA.

Baj'azet' I., or **Bayazid I.**, a Turkish sultan: b. 1347; d. 1403. In 1389 he succeeded his father, Murad or Amurath, who fell in the battle of Kossova against the Servians, and caused his brother Jacob, his rival for the throne, to be strangled. He made great and rapid conquests, in three years conquering Bulgaria, part

BAJAZET — BAKER

of Servia, Macedonia, Thessaly, and subjecting the states of Asia Minor. In order to save Constantinople, King Sigismund of Hungary (afterward emperor of Germany) assembled a great army, but Bajazet met them at Nicopolis and obtained a decisive victory over the allied Hungarians, Poles, and French in 1396. He would probably have now overturned the whole Greek empire if Timur had not overrun Asia Minor in 1400 and defeated him in a battle at Angora. He himself fell into the power of the conqueror and died in Timur's camp, in Carmania. His successor was Soliman I. **BAJAZET II.**, b. 1447; d. 1512, succeeded his father, Mohammed II., Sultan of the Turks, in 1481. He increased the Turkish empire by conquests on the northwest, and in the east, took Lepanto, Modon, and Durazzo, in a war against the Venetians, and ravaged the coasts of the Christian states on the Mediterranean, to revenge the expulsion of the Moors from Spain. At home he had to contend against his rebellious son Selim, to whom he at last resigned the empire. It has been supposed that he was put to death by the order of his son. He was a man of great talents, and did much for the improvement of his empire and the promotion of the sciences.

Baj'azet', the title of a tragedy by Racine, in which the chief character is Bajazet, the brother of the Sultan Amurath, whose choice between the throne and the woman he loves forms the theme of the drama.

Baj'azet', Mosque of, a mosque at Constantinople, built in 1505 by Bajazet II. It is one of the finest specimens of Mohammedan architecture, and displays excellent proportions and great richness of detail in decoration. There are four Persian doorways and an octagonal foundation in the centre of the court.

Baj'imonts' Roll. See **BAGIMONTS' ROLL**.

Bajocco, bayöck'kō, or **Baiocco**, a papal state copper coin, whose value is about one cent. A Neapolitan coin, value about 83 cents, was also called Bajocco in Sicily.

Baj'ree. See **GUINEA CORN**.

Bajura, ba-joo'ra, the banner of Mohammed.

Bajza, boi'zō, **Joseph**, Hungarian poet and critic: b. 1804; d. 1858. He devoted himself to history, and edited a 'Historical Library' (1843-5) and the 'New Plutarch' (1845-7). He was also editor of two critical journals, which exerted a strong influence on Hungarian literature. From 1831 he was a member of the Hungarian Academy, and from 1836 of the Kisfaludy Society. He ranks among the best lyric poets of Hungary. His 'Poems' appeared in 1835, and his 'Collected Works' in 1861.

Bakacs, bō'köch, **Thomas**, Hungarian statesman, son of a peasant: b. about the middle of the 15th century; d. 1521. He held several bishoprics in succession, became chancellor of the kingdom, and finally archbishop and cardinal. He preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility, and a fierce civil war ensued.

Bakairi, ba-kā-i-re, or **Baccahiry**, a Caribbean tribe of central Brazil, remarkable for their light complexion. The men have assembly

houses, where they spend most of their time, which women are forbidden to enter.

Bakalahari, ba'kā-la-hā'rē, a Bechuana tribe inhabiting the Kalahari Desert, in south Africa.

Bakalai, ba-kā'li, a Bantu tribe of French equatorial Africa, numbering more than 100,000. In religion they are Mohammedans.

Bakarganj, bak'ar-ganj, an English district in India, under the lieutenant-governor of Bengal. It contains 3,649 square miles, is fertile, and is watered by the lower streams of the Ganges and the Brahmaputra. In the south of the district are the forest tracts of the Sunderbunds. Barisal, the headquarters, on the west bank of Barisal River, is the only town with more than 5,000 inhabitants. Bakarganj, the former capital, situated near the junction of the Krishnaki and Khairabad rivers, is now in ruins. Pop. 2,153,695.

Bakau, ba-kow', a town of Rumania, capital of the district of Bakau, situated on the Bistritza River. It is a railroad centre, and has considerable trade in farm products. Pop. about 15,000.

Bakchiserai, bak-chīz'ēr-i (Turkish, "Garden Palace"), a town in the Russian government of Taurida, the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, 15 miles by rail southwest of the present capital, Simferopol. The palace (1519) of the khans has been completely restored by the Russian government in the Oriental style. Pop. about 1,200.

Bake, ba'kē, **Jan**, Dutch philologist: b. Leyden, 1 Sept. 1787; d. 28 March 1864. In 1817 he became professor of Greek and Roman literature at the University of Leyden, holding the position till 1857. Here he edited and published valuable editions of Posidonius, and of the astronomer Cleomedes, and assisted in the large and original work entitled 'Bibliotheca Critica Nova.' He published a series of philological articles, edited some of the works of Cicero, and wrote an excellent essay upon the Greek tragedians.

Bakel, ba-kēl', a town of the French colony of Senegal, western Africa, capital of the arrondissement of Bakel, situated on the Senegal River. It is an important trading post. Pop. (1897) 3,000.

Bak'er, **Sir Benjamin**, English engineer: b. near Bath, 1840. In 1877 he superintended the removal of Cleopatra's Needle from Egypt to London, designing a ship for that purpose. In conjunction with Sir John Fowler he drew the plans for the great bridge over the Firth of Forth. He has written numerous scientific treatises, including 'Long Span Iron Bridges'; 'Suspension Versus Cantilever Bridges'; 'The Strength of Beams'; and 'Transportation and Re-erection of Cleopatra's Needle.'

Bak'er, **Benjamin W.**, American educator: b. Coles County, Ill., 25 Nov. 1841. He served in the Union army through the Civil War; became a Methodist Episcopal clergyman in 1874; and was financial secretary of the Illinois Wesleyan University in 1883-93; president of Chaddock College in 1893-8; and subsequently became president of the Missouri Wesleyan College in Cameron.

BAKER

Bak'er, Charles Whiting, American civil engineer: b. Johnson, Vt., 17 Jan. 1865. He was graduated at the engineering department of the University of Vermont and became managing editor of 'Engineering News' in 1900. He is the author of 'Monopolies and the People'; etc.

Bak'er, Edward Dickinson, American soldier and politician: b. London, England, 24 Feb. 1811; d. 21 Oct. 1861. He came to the United States in youth, was elected to the Illinois legislature in 1837, became a State senator in 1840, and was sent to Congress in 1844. He served under Gen. Scott in the war with Mexico, and was elected United States senator from Oregon in 1860. He entered the Federal army at the outbreak of the Civil War, and was killed at the battle of Ball's Bluff.

Bak'er, Frank, American zoologist: b. Pulaski, N. Y., 1841. He was professor of anatomy in the University of Georgetown; and in 1900 was superintendent of the National Zoological park, in Washington, D. C. He is a Fellow of the American Association for the Advancement of Science, and a member of the Academy of Science, and the Anthropological and the Biological Societies, all in Washington.

Bak'er, George Augustus, American painter: b. New York, 1821; d. 2 April 1880. He studied at the National Academy of Design in New York, and in Europe, and was elected to the National Academy in 1851. He was especially celebrated as a portrait painter, and reproduced flesh-tints very accurately. His principal works, aside from his portraits, are 'Love at First Sight'; 'Wild Flowers'; 'Faith'; and 'The May Queen.'

Bak'er, George Augustus, American writer of verse and stories: b. New York, August 1849. He wrote 'Point Lace and Diamonds,' light society verse (New York 1875) 'Bad Habits of Good Society' (1876); 'Mrs. Hephestus and Other Stories' (1882); and several comedies.

Bak'er, Harriette Newell (WOODS) (pseudonyms MADELINE LESLIE and AUNT HATTY), American writer of juvenile stories: b. 1815; d. 1893. A very voluminous writer, several of her works have been translated into French and German. She has written 'Tim, the Scissors-Grinder' (1861, sequel in 1862), her most popular work; 'Up the Ladder' (1862); 'The Two Homes' (1862); 'The Organ-Grinder' (1863); 'White and Black Lies' (1864); 'Worth and Wealth' (1864); 'Tim's Sister' (1864); 'Wheel of Fortune' (1865); 'Courtesies of Wedded Life' (1869) 'Paul Barton' (1869); 'Fashion and Folly' (1869); 'Lost but Found' (1869); 'Ingleside' (1886); 'This and That' (1887); etc. She was a daughter of Leonard Woods, the theologian, and wife of Rev. Abijah R. Baker.

Bak'er, Henry, English naturalist: b. 8 May 1698; d. 25 Nov. 1774. In 1740 he was chosen a Fellow of the Royal and Antiquarian societies, and in 1744 obtained the Copley medal for his microscopical discoveries on crystallization. He contributed many papers to the 'Philosophical Transactions'; was an active member of the Society for the Encouragement of Arts. He wrote 'The Microscope Made Easy'; 'Employment for the Microscope'; many scientific papers, and several poetical works.

Bak'er, Ira Osborn, American educator: b. Linton, Ind., 23 Sept. 1853. He became professor of civil engineering in the University of Illinois in 1880, and has published 'Engineers' Surveying Instruments'; 'Treatise on Masonry Construction'; and 'Brick Pavements.'

Bak'er, James Hutchins, American educator: b. Harmony, Me., 13 Oct. 1848. He was principal of the Denver High School in 1875-91; and in the last year became president of the National Council of Education, and also of the University of Colorado. He has published numerous lectures and monographs, and a work on 'Elementary Psychology.'

Bak'er, John Gilbert, English botanist: b. Guisborough, Yorkshire, 13 Jan. 1834, and was appointed assistant curator at the herbarium at Kew in 1866. He was for many years lecturer on botany to the London Hospital, and in 1882 received a like appointment from the Apothecaries' Company; he is also a member of the Royal and Linnæan Societies. His voluminous writings include works on the flora of districts so diverse as the north of England, Madagascar, and Brazil; and popular monographs and scientific catalogues of high value.

Bak'er, Lafayette C., American detective: b. Stafford, N. Y., 13 Oct. 1826; d. 2 July 1868. He was chief of the Secret Service Bureau during the Civil War; and reached the military rank of brigadier-general. He superintended the pursuit of Wilkes Booth, President Lincoln's assassin; and published a 'History of the United States Secret Service' (1868).

Bak'er, Marcus, American cartographer: b. Kalamazoo, Mich., 23 Sept. 1849. He became connected with the United States Coast and Geodetic Survey in 1873, and with the United States Geological Survey in 1886; and in 1900 was secretary of the United States Board on Geographic Names. He was cartographer to the Venezuela boundary commission, and after spending many years surveying and exploring in Alaska, and along the Pacific coast, prepared, with William H. Dall, the 'Alaska Coast Pilot.'

Bak'er, Moses Nelson, American civil engineer: b. Enosburg, Vt., 26 Jan. 1864. He was editor for several years of the 'Manual of American Waterworks'; and in 1900 was associate editor of 'Engineering News.' He has published 'Sewage Purification in America'; 'Sewerage and Sewage Purification'; etc.

Bak'er, Osmon Cleander, American clergyman: b. Marlow, N. H., 30 July 1812; d. 20 Dec. 1871. He was educated at Wesleyan University; spent several years in teaching, and was one of the founders of the system of Methodist Episcopal theological schools. He was professor in the Biblical Institute in Concord, N. H., 1847-52, and in the last named year was elected a bishop. His work, 'Guide-Book in the Administration of Discipline of the Methodist Episcopal Church' (1855), is a standard authority.

Bak'er, Sir Richard, English historian: b. Kent, 1568; d. 1645. He was educated at Oxford, and knighted in 1603 by James I.; in 1620 he filled the office of high sheriff of Oxfordshire, having estates in that county. Shortly afterward he was thrown into Fleet Prison be-

BAKER—BAKER'S DOZEN

cause of having given security for a debt contracted by his wife's family, which he was unable to pay. During his imprisonment he wrote 'Chronicle of the Kings of England,' first published in 1641, and afterward continued by Edward Phillips, the nephew of Milton, and others, a work popular at the time, but not of permanent value. He died in prison.

Bak'er, Sir Samuel White, English explorer: b. London, 8 June 1821; d. 30 Dec. 1893. He was trained as an engineer, and at the age of 24 went to Ceylon, where he founded an agricultural settlement at Nuwara Eliya in 1847. In the early part of 1861, accompanied by his wife, he set out for Africa on a journey of exploration. When he had ascended the Nile as far as Gondokoro he met Speke and Grant returning after their discovery of the Victoria Nyanza Lake, and learned from them that another large lake in the district had been spoken of by the natives. This lake he determined to discover, and after many adventures he and his wife beheld the Albert Nyanza, on 14 March 1864. On his return home he was received with great honor, and was knighted. In 1869 he returned to Africa as head of an expedition sent by the Khedive of Egypt to suppress the slave trade, and to annex and open up to trade a large part of the newly explored country, being raised to the dignity of pasha. Returning in 1873, he was succeeded by the celebrated Gordon. In 1879 he explored the island of Cyprus, and subsequently traveled in Asia and America. His writings include: 'The Rifle and the Hound in Ceylon' (1854); 'Eight Years' Wanderings in Ceylon' (1855); 'The Albert Nyanza' (1866); 'The Nile Tributaries of Abyssinia' (1867); 'Ismailia, a Narrative of the Expedition to Central Africa' (1874); 'Cyprus as I saw It in 1879'; 'Wild Beasts and Their Ways' (1890); also, 'Cast up by the Sea,' a story published in 1869.

Bak'er, Thomas, English antiquary: b. 1656; d. 1740. His 'Reflections on Learning' (1709-10) went through seven editions. He left in manuscript 42 folio volumes of an 'Athenæ Cantabrigiensis,' from which a 'History of St. John's College' was edited by Prof. Mayor in 1869.

Bak'er, Valentine, English military officer, also known as Baker Pasha: b. 1825; d. Tel-el-Kebir, 1887. He was a brother of Sir Samuel White Baker. For his services in the Crimean war he was made colonel of the 10th Hussars. In the Russo-Turkish war of 1877 he was in the Turkish service, and subsequently served in Egypt. He wrote 'Clouds in the East' (1876); and 'The War in Bulgaria' (1879).

Bak'er, William Bliss, American artist: b. New York, 1859; d. Ballston, N. Y., 1889. He studied at the National Academy, and is especially noted for his landscapes. Among his works are 'In the Old Pasture'; 'October Morning'; and 'Under the Apple-Tree.'

Bak'er, Sir William Erskine, Scottish military and civil engineer: b. Leith, Scotland, 1808; d. 16 Dec. 1881. He served in the first Sikh war, and afterward held many offices in the public works department of India. His engineering work in Scinde was very valuable, as the scheme of irrigation which he carried

through has imparted fertility to a barren territory. He became a member of the council of India in 1861; major-general in 1865; a K. C. B. in 1870; and retired from public life in 1875.

Bak'er, William Henry, American gynecologist: b. Medford, Mass., 11 March 1845. He was graduated at the Harvard Medical School, and became professor of gynecology there. His publications include 'The Treatment of Cancer of the Uterus'; 'Diseases of the Urethra and Bladder'; etc.

Bak'er, William Mumford, American novelist and clergyman: b. Washington, D. C., 27 June 1825; d. South Boston, Mass., 20 Aug. 1883. He was graduated at Princeton 1846, and held Presbyterian pastorates in Texas for 15 years, when he returned to the north and accepted a charge in South Boston. As a writer, one of his most important books was 'Inside: A Chronicle of Secession' (1866), secretly written during the war, and giving an illuminating picture of Southern sentiment. Other works are: 'Life and Labors of Rev. D. Baker' (1858); 'The Ten Theopanies' (1883). His novels, several of which appeared serially, include: 'Mose Evans' (1874); 'Carter Quarterman' (1876); 'Colonel Dunwoodie' (1878); 'The Virginians in Texas' (1878); 'His Majesty Myself' (1879); and its sequel, 'The Making of a Man' (1884); 'Blessed Saint Certainty' (1881).

Bak'er, and the Baker's Wife, The, names popularly given to Louis XVI. of France, and Marie Antoinette, because they gave bread to the starving mob at Versailles, 6 Oct. 1789.

Bak'er City, Ore., a city and county-seat of Baker County, situated on the east fork of the Powder River, 360 miles east of Portland, on the Oregon R.R. It is the centre of an extensive farming, gold-mining and stock-raising region, and has a considerable export trade. It is governed by a mayor, biennially elected, and a city council. Pop. (1900) 6,663.

Bak'er, Mount, an occasionally active volcano in Whatcom County, Wash., belonging to the Cascade Range. It was very active in 1880; elevation, 10,827 feet.

Bak'er University, a co-educational institution in Baldwin, Kan. It was founded in 1858, under the auspices of the Methodist Episcopal Church, and at the end of 1899 had 24 professors and instructors, and 568 students. Its library contained 8,000 volumes, and the grounds and buildings were valued at \$80,000.

Bak'eries, Military. See FIELD KITCHENS, MILITARY.

Bak'er's Antelope, a large antelope (*Hippotragus Bakeri*) of equatorial Africa, discovered by Sir Samuel Baker. It is pale brownish-red with black stripes on the shoulders, and has massive horns.

Bak'er's Dozen, a familiar phrase supposed to have originated in an old practice of bakers who, when a heavy penalty was inflicted for short weight, used to give a surplus number of loaves, called the inbread, to avoid all risk of incurring the fine. Thirteen, therefore, became a baker's dozen, and 13 also is assumed to be the number of witches who sat down together at dinner on the Lord's Day, even as it was the number who were at that last Passover

BAKERSFIELD — BAKUNIN

supper which immediately preceded the betrayal of Christ. Thirteen was also called the "devil's dozen."

Bak'ersfield, Cal., a town and county-seat of Kern County, situated on the Kern River and on the Southern Pacific railroad. It is the centre of an oil region and of a stock-raising and fruit-growing industry; therefore has a good trade and some manufacturing interests as well. Pop. (1900) 4,836.

Bake'well, **Robert**, English agriculturist: b. 1725; d. 1795. He succeeded his father, in 1760, as occupier of the Dishley farm in Leicestershire, and then began experiments for the improvement of cattle (introducing the celebrated long-horned breed), and also of horses, pigs, and sheep. He also introduced into English agriculture the practice of flooding meadows. He never contributed anything to literature, but Arthur Young, in his annals of agriculture, fully described and praised his plans and improvements.

Bakhmut, bakh-moot'. See BACHMUT.

Bakhtchissarai, bāk'chē-sā-rī', a town of Russia, the capital of the government of Taurida; situated on the Tchoorook, 15 miles southwest of Simferopol. It consists of a single street, built along the banks of the Tchoorook, and lined in Oriental fashion with bazaars and workshops. It contains also several mosques, whose tall minarets rise high above the neighboring houses. Here also is the ancient palace of the khans who ruled over the Tauridian state before the rise of Russian power. The inhabitants are chiefly Mohammedans. Pop. (1900) 13,000.

Bakhtegan, bakk-tē-gan, a salt lake in Persia, 47 miles east of Shiraz, 74 miles long and from 4 to 13 miles wide. Large quantities of salt are gathered from its basin.

Bakhtiari, bākh'tē-ā'rē. (1) A range of mountains of Persia extending parallel to the Arva and Laristan ranges. (2) A half-civilized tribe living in the above mountains, estimated to number 232,800.

Baki, bā'kē, the greatest lyric poet of Turkey: died about 1600. His 'Divan' contains almost exclusively odes in praise of the Sultan.

Baking Machinery. See BREAD AND BREAD-MAKING.

Bak'ing Pow'der, a chemical preparation used in the place of yeast to give lightness to bread and other similar articles of diet. Yeast induces a kind of fermentation, accompanied by the generation of bubbles of the gas known to chemists as carbon dioxide; and it is the development of these bubbles within the dough that causes it to swell (or "rise") and become light. When baking powder is used in the place of yeast, the action is similar, except that the gas is generated by direct chemical action, instead of by fermentation. The best baking powders contain bicarbonate of soda or bicarbonate of ammonia as their alkaline constituent, intimately mixed with tartaric or phosphoric acid, or an acid tartrate or phosphate. So long as the powder is kept dry, its acid and alkaline constituents do not combine with each other; but when moistened, combination takes place, and carbon dioxide is generated, just as in the case of yeast. Owing to the cost of tartrates

and phosphates, alum is not infrequently used as the acid constituent in the cheaper powders; but health authorities almost universally condemn this substitution.

Bakkebakke, bāk'kē-bāk'kē, a tribe of African pigmies dwelling in the French Congo territory.

Bakonywald, bö'kōn-y'-vält, a mountain range in Hungary, between the Raab and Lake Balaton, separating the great and little Hungarian plains. Average elevation, 2,000 feet. It is covered with forests, on the mast of which large herds of swine are fed. There are fine quarries of marble in the mountains.

Baksheesh, bāk-shēsh', or **Bakshish**, an Eastern word, denoting a present or gratuity. In Egypt and other parts of the Turkish empire the traveler has scarcely set foot on shore before clamors for baksheesh, on the most frivolous pretexts, or in simple beggary, without pretext at all, assail his ears from every quarter. Baksheesh is the first Arabic word with which he becomes acquainted, and he acquires it unwillingly.

Baku, a Russian town in Georgia, on the Caspian Sea. The rocky peninsula upon which it is built and the islands in the bay are composed of Tertiary strata, abounding in fossil shells. Through these strata numerous springs of naphtha and petroleum issue, together with streams of inflammable gas, and eruptions of mud from so-called mud volcanoes. These phenomena give to the region the name of the Field of Fire, and formerly made Baku the sacred city of the Guebres or Fire Worshipers. Naphtha is so abundant as to be an article of commerce. The chief product of the region, however, is petroleum. Over 500 oil wells are operated, producing large quantities of petroleum, much of which is carried by pipes directly to the refineries. Baku has a large trade, exporting besides the oil, grain, salt, etc. It has grown very rapidly in recent years, its prosperity being due to the petroleum industry which is chiefly in the hands of foreign capitalists. See Marvin, 'The Region of Eternal Fire' (1883); Louis, 'The Baku Petroleum District' in the 'Engineering Magazine, No. XV.' (1898). Pop. about 119,000.

Bakunin, ba-koon'yen, **Michel**, Russian anarchist: b. 1814; d. 1 July 1876. He was educated in a military school at St. Petersburg, and served for a time in the artillery of the guards. In 1841-3 he was in Germany, engaged in philosophical study. In 1843, he went to Paris, and entered into relations with the Polish emigration, and shortly afterward to Switzerland, where he participated actively in various socialist and communist associations. The Russian government ordered him to return home. Bakunin refused, and his estate was confiscated. In 1847, during the excitement produced in Paris by the question of parliamentary reform, he made a speech invoking the fusion of Poles and Russians, for the better and easier revolutionizing of Russia, on account of which the Russian government demanded his expulsion from France. For the next two years he was active in the revolutionary movement at Prague, at Berlin, and at Dresden. He was taken prisoner and condemned to death; but the sentence was commuted to life imprisonment

BALA — BALAKLAVA

and he was sent to Siberia. In 1860, he escaped to Japan, and from there went by way of the United States to London. Here he joined the work of the revolutionary socialist movement, and in 1869, founded the Social Democratic Alliance, which later joined the International Workingmen's Association. His views were thoroughly anarchistic and when he tried to impose them upon the Association he was expelled by the Hague Congress in 1872. In 1873 Bakunin stopped active work and lived for the rest of his life in Switzerland.

Bala, ba-la, a town of North Wales, at the north end of the Bala lake, county of Merioneth. The town and its neighborhood have long been famous for the manufacture of knitted stockings, and gloves of strong and soft texture. At the south end of the town is a large artificial mound, supposed to be of Roman origin. This mound was anciently occupied by the Welsh as a fort to prevent the incursions of the English.

Bala Beds, a local deposit in North Wales, near Bala, which form a group in the Lower Silurian of Murchison. They consist of a few beds, rarely more than 20 feet in thickness, and chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice molding, affording a characteristic by which, at a considerable distance, the Bala Beds can be distinguished from the rocks of hard, gritty slate above and below. Trilobite and cystidæ are the predominant fossils of the group.

Balaam, a Biblical personage, the son of Beor, and a native of Pethor. The children of Israel had reached, in their journey, the plains of Moab. Balak, the king, terrified at seeing so great a host invading his territory, sent, therefore, to Balaam, a well-known prophet and soothsayer, to come and curse these hosts for him, so that, peradventure, he might then smite them and drive them out of the land. Balaam, warned of God in the night, refused to go with the messengers, and sent them away. Balak sent yet others. He at first also refused them, but in the morning he went, with the divine injunction to speak what the Lord should tell him. The angel of the Lord met him in the way, gave the ass he rode a vision in three several instances, and each time Balaam angrily smote the beast for her involuntary manifestations of terror. After the third beating an interlocution ensued between the ass and the master, when the Lord opened the eyes of Balaam, and, seeing the angel, he conversed with him instead of the ass. As the result of the conversation, Balaam was permitted to go on, and the charge repeated to speak only that which the Lord should tell him. Coming unto Balak, he informed him that he could only speak that which God shall put into his mouth. Balaam refused to curse Israel, but pronounced a blessing upon them, in the three several places to which Balak brought him in the vain hope of securing his purpose. This is the Old Testament history of the transaction, given in Numbers xxiii.-xxiv. In Numbers xxxi. 8, 16, and Joshua xiii. 22, Balaam is mentioned as advising Balak to lead the children of Israel into idolatry, which, according to his directions, they did, and hence arose a war with Moab.

Bal'achong, an Oriental condiment, composed of small fishes, or shrimps, pounded up with salt and spices and then dried.

Bal'æna, the genus including the Greenland or right whale, type of the family *Balaenidae*, or whale-bone whales. Hence *baleen* = whalebone.

Bal'aniceps ("whale-head"), a genus of African wading birds belonging to the region of the Upper Nile, intermediate between the herons and storks, and characterized by an enormous bill, broad and swollen, giving the only known species (*B. rex*), also called shoe-bird. It feeds on fishes, water-snakes, carrion, etc., and makes its nest in reeds or grass adjoining water. The bill is yellow, blotched with dark brown, the general color of the plumage dusky gray, the head, neck, and breast slaty, the legs blackish.

Balaguer, ba-la-gär', **Victor**, Spanish historian: b. Barcelona, 11 Dec. 1824. He became keeper of the archives at Barcelona, professor of history in the university there; and was an active Liberal politician, and, in 1888, chief of the council on the Philippine Islands. He wrote 'The Troubadours of Montserrat' (1850); 'Political and Literary History of the Troubadours' (1878-80); 'Poems' (1874); 'Don Juan de Serravalle' (5th ed. 1875), etc.

Balahissar, ba'-la-his-sar', a village in the southwestern part of the province of Angora, Asia Minor. It is on the site of the ancient Pessinus, famous for its worship of Cybele. Among fragments of marble columns, friezes, etc., rise the ruins of her gorgeous temple, and remains of a theatre in partial preservation, a castle, and a circus.

Balakireff, ba-lä'-ke-ryëf', **Mili Alexeyevich**, Russian composer: b. Nizhni-Novgorod, 1837; he is ranked as the founder of the young Russian school of music. At 18 he is said to have known by heart nearly all of the musical classics. With other musical enthusiasts he strove to impart a flavor of nationalism into music, his especial works in this direction being 'Songs' (1858-60); three overtures on Russian themes; three on Chekh themes (1867); 'Forty National Songs' (1866); 'Islamey,' a fantasy (1869). His most important compositions are 'Tamara,' a fantasy for orchestra and a symphony in C major. His extended works illustrate programme music of the Berlioz Liszt school. See Cui, 'La Musique en Russie' (1880); Pongin, 'Essai Historique sur la Musique en Russie' (1897).

Balaklava, ba-la-klä'va, or **Balaclava**, a small seaport of Russia, in the Crimea, eight miles south-southeast of Sebastopol. It consists for the most part of houses perched upon heights, and it has an old castle, built by the Genoese. The harbor has a very narrow entrance, and, though deep, is not capacious. In 1854 Balaklava became the principal landing-place of the British after the battle of the Alma. The battle of Balaklava fought 25 Oct. 1854, when the Russians in overwhelming force were repulsed by a small body of British troops, is one of the most heroic achievements of modern times, the "charge of the light brigade" being the most glorious incident in the conflict. (Kinglake, 'Invasion of the Crimea'; Paget, 'The Light Cavalry Brigade in the Crimea.')

BALAMBAN — BALANCE

Balamban, bā-lām'bān, a small town on the west coast of Cebu, on Tanon Strait, Philippines. It was occupied by a garrison of United States infantry after a battle with Filipino insurgents early in January 1900. It has a native population of some thousands, and a public school in which English is taught.

Balan, ba-lan. (1) A French poem, an early version of 'Fierabras,' of which there was also an English version, 'The Sowdan of Babylon.' (2) The brother of Balin, in Arthurian legends.

Bal'ance (Latin, *bis*, "twice," and *lanx*, a "dish," or "pan"), an instrument for determining the mass of a body by comparison with a series of other bodies (called "weights") whose masses are known. The term is often applied, though somewhat incorrectly, to the familiar instruments in which the weight of a body is determined by observing the extension that it can produce when acting upon a spring whose extensibility has been previously determined by direct experiments with known weights. The "spring balance" is useful in the ordinary affairs of life, where high precision is not essential; but it is seldom employed in accurate scientific work, since it is liable to errors that cannot be eliminated or allowed for—errors that are small enough to be neglected in commercial transactions, but quite intolerable in refined laboratory work.

The "lever balance" consists essentially of a lever (q.v.) having arms of known lengths. The mass to be determined is suspended at the extremity of one of the arms, and the known masses (or weights) are suspended from the extremity of the other one, their number and size being varied until, after repeated trials, a perfect equilibrium, or "balance," is attained. If the two arms of the lever are equal, the mass of the body under examination is then equal to the sum of the masses of the weights that are balanced against it. In many cases (for example, in the familiar "platform scales") the arms of the lever are intentionally made very unequal, the object to be weighed being suspended from the short arm of the lever, while the weights are suspended from the long arm. To determine the mass of the object it is then necessary to multiply the sum of the masses of the weights by the ratio of the long arm to the short one; but in practical work this calculation does not need to be performed, because the instrument is graduated by the maker so that all necessary allowance for the difference in the arms has been made, and the readings give the corrected mass directly. In many cases the balances (or "scales") used in commerce are constructed so that equilibrium is attained by varying the length of the lever-arm rather than by varying the load at the extremity of that arm; but the fundamental principles involved are the same in all cases, and are set forth in detail in the article LEVER (q.v.).

In the "precision balance" of the chemist and physicist, the lever (called the "beam") consists of a light but strong and rigid framework, usually made of brass or bronze, and having a shape somewhat like that shown in Fig. 1. It is supported by means of a wedge-shaped piece of steel, technically known as a "knife-edge," which is hardened and ground to a sharp and accurately straight edge, and which rests, when the balance is in use, upon a flat slab of agate,

or other hard, smooth substance, in such a manner as to leave the beam free to tip one way or the other, with practically no frictional

FIG. 1

resistance. (The agate slab is suggested by the dotted contour, *k*, in the figure; the pillar that supports *k* being omitted for the sake of clearness.) Knife-edges similar to the central one, but with their edges directed upward instead of downward, are provided at the respective ends of the beam (as shown at *A* and *B*) for the support of the pans (only one of which is shown) in which the masses to be compared are placed. The three knife-edges, *A*, *B*, and *C*, must be made with great care, and must be set in position so that they shall be accurately parallel to one another. They must, moreover, have their edges all in the same plane, so that a straight line joining any two points in the edges of *A* and *B* will likewise pass through the edge of *C*. The two arms of the beam should also be precisely equal, so that *C* is exactly half way between *A* and *B*. *P* is a pointer whose free end travels over a graduated scale, so as to indicate the extent of the oscillations of the beam as it swings to and fro on the central knife-edge *C*. When the beam is horizontal, its centre of gravity (*G* in Fig. 2) should lie in

FIG. 2

the same vertical line, *ab*, with the central knife-edge. Whether this condition is fulfilled or not is easily shown by removing the scale-pans and allowing the beam to come to rest. It can only be in equilibrium when its centre of gravity is directly below the knife-edge *C*; so that if it comes to rest in a horizontal position it is evident that the condition specified above is sensibly realized. If, on the other hand, the beam, when freed from the pans, comes to rest with its right-hand end lower than the left-hand one, it is evident that the centre of gravity of the beam is too far to the right, as is indicated by the point *g*. The better makes of balance are provided with an adjustment to correct an error of this sort. This adjustment may take the form of a fine screw-thread carry-

BALANCE

ing a nut, as suggested at *E*. If the nut be caused to approach *B*, the centre of gravity of the beam (considering the nut as a part of the beam) will thereby be shifted toward the left, and after a number of trials the point *g* may be made to coincide with *G*, so that the beam, when free from the pans, comes to rest in a perfectly horizontal position. If it does not remain horizontal when the pans are suspended in their proper places, then it follows that one of the pans is heavier than the other; this defect is easily remedied by the use of a light counterpoise in connection with the lighter pan, or by removing a small portion of the material of the heavier one.

The centre of gravity of the beam being properly adjusted, and the equality of the two pans being assured, it is evident that the beam will set itself in a horizontal position when the pans are empty. The balance may still be defective, however, through the arms not being of precisely equal length. The equality of the arms may be tested in the following manner: Let a mass, *P*, be placed in one of the pans, and suppose that *w* is the mass that has to be placed in the other pan in order to secure a perfect balance. Let *L* be the length of the arm from which *P* is suspended, and *l* be the length of the arm from which *w* is suspended, as indicated in

FIG. 3

Fig. 3. Then, by the principle of the lever, we have—

$$P \times L = w \times l.$$

Next, let *P* be placed in the other pan, connected with the arm whose length is *l*, and yet *W* be the mass that must be suspended from the arm of length *L*, in order to secure a perfect balance. We then have the equation—

$$P \times l = W \times L.$$

Now, if *P* be eliminated between these two equations, we have the relation—

$$L \div l = \sqrt{w \div W};$$

and since *W* and *w* are both known, it follows that the ratio of the two arms of the balance is also known. If this ratio does not come out sensibly equal to unity, its value may be carefully determined, and allowance made for the inequality of the arms after a weighing has been performed. The effect of inequality in the arms may also be eliminated by a double weighing, such as has been supposed to be performed, above. For if we eliminate *L* (instead of *P*) from the foregoing equations, we find—

$$P = \sqrt{W \times w};$$

that is, the true weight is the geometric mean between *W* and *w*. In practice the arms of a good balance are so nearly equal that the simple arithmetic mean of *W* and *w* is a sufficiently close approximation to the geometric mean required by theory.

The sensitiveness of a balance depends largely upon the position of the centre of gravity of

the beam relatively to the central knife-edge. Thus, if the arms of the balance are precisely equal, and the beam hangs perfectly horizontal with a weight *P* in each pan, the angle, *x*, through which the beam turns when the weight in the left-hand pan is increased to *P* + *p*, may be taken as a measure of the sensitiveness of the balance. Let *S* be the weight of the beam itself, and let the centre of gravity of the beam be at a distance, *h*, below the central knife-edge when the beam is horizontal. Then, if *x* is the angle that the beam makes with the horizontal when it comes to rest with *P* + *p* in the left-hand pan and *P* in the right-hand pan, the theory of the lever gives the equation (see Fig. 4) —

$$(P + p) \cdot L \cdot \cos x = P \cdot L \cdot \cos x + h \cdot S \cdot \sin x,$$

from which we easily obtain—

$$\tan x = \frac{L \times p}{h \times S}.$$

FIG. 4

It is evident that *x* will be increased as *h* is decreased, so that the sensitiveness of the balance becomes greater the nearer the centre of gravity of the beam is caused to approach to the centre of support. The balance should be provided with a thread and nut, *D* (see Fig. 1), to facilitate the vertical adjustment of the centre of gravity, in the same way that *E* is used in adjusting the horizontal position of that point. The centre of gravity of the beam must always remain below the centre of support, because when it is above that point the beam is unstable, and when it coincides with the centre of support the instrument will remain in equilibrium in any position. When a balance is made very sensitive, by bringing the centre of gravity close to the point of support or by increasing the length of the arms of the beam, the period of oscillation of the beam grows very long, so that the instrument is tedious to use. The experienced chemist or physicist therefore selects a balance whose sensitiveness and period of oscillation can be best adapted to the work he has in hand.

The "precision balance" is a delicate instrument, and should be kept in a glass case, for protection, when not in actual use. The weighings are also performed with the balance enclosed in like manner, in order to avoid error from the effect of air-currents upon the beam. The knife-edges should be kept away from their bearings, and provision is always made for raising the pans from the ends of the beam, and the beam itself from the central support, by means of a system of stops and levers (not here shown) actuated by a conveniently situated lever or wheel. The beam and pans should always

BALANCE OF POWER

be raised in this manner when changing the weights in the pans, in order to avoid giving the least shock to the knife-edges; for when these are dulled or otherwise injured the accuracy and sensitiveness of the balance are materially lessened.

Weighings may be effected by two general methods. In the first method the position of the pointer, P (in Fig. 1), is noted on the scale at its extremity when the balance is at rest with the pans empty. The position so recorded is called the "zero" of the balance. The object to be weighed is then placed in one of the pans, and weights are added to the other pan until the balance will come to rest with its pointer at the same spot, or zero, as before. The weighing is then complete.

In the second method of conducting the experiment (known as the "method by oscillations") the balance is not brought to rest at all, the necessary readings being taken while the beam is oscillating. The zero reading of the pointer is first obtained (with the pans empty) in the following manner: The empty balance is allowed to oscillate freely for a short time, and then the position attained by the pointer at one of its extreme positions toward the right is noted. The reading of the next following extreme position to the left is then taken, and so on, observing the positions attained at the alternate right and left swings, just as the pointer pauses and begins to return toward the mean position. The last reading is taken on the same side as the first, so that there is an odd number of observations on one side of the zero, and an even number on the other side. The readings on the right are then averaged together, and those on the left are also averaged in the same way; after which the mean reading on the right is averaged with the mean reading on the left, and the result is taken as the position of the zero of the balance. The object to be weighed is then placed in one pan, and the weights in the other, the process of guess and trial being followed here just as in the preceding method until an almost exact balance has been attained. The method of oscillations, with alternate readings to the right and left, is next repeated in precisely the same manner as when the pans were empty, and the reading obtained by the final averaging of these observations is taken as the reading of the balance for the loads that are in the pans at the time. A very small weight is next added to one of the pans, and the oscillations are again observed, under the new conditions, precisely as before. The weight of the object under examination can then be determined by simple proportion. Thus, suppose that the original zero reading of the pointer, with the pans empty, was 11.6. The object to be weighed being placed in one pan, and weights having a combined mass of W in the other, let the reading of the pointer (as deduced from the oscillations) be 10.4. The small mass, w , being then added to W , let the final reading of the pointer be 12.2. The following facts are now known: With empty pans the pointer reads 11.6. With the unknown mass (which may be denoted by P) in one pan, and a mass, W , in the other, the pointer reads 10.4. Finally, with P in one pan and $W + w$ in the other, the pointer reads 12.2. The mass w has displaced the reading of the pointer by 1.8 divisions. If it be assumed that a mass x , when

added to W , would have made the reading of the pointer precisely 11.6, as it was with the empty pans, we have the additional fact that a mass x would alter the reading of the pointer by 1.2 divisions. Hence the simple proportion —

$$x : w :: 1.2 : 1.8;$$

whence $x = \frac{2w}{3}$, and therefore the concluded

$$\text{mass of } P \text{ is } W + \frac{2w}{3}.$$

The method of oscillations is favored by many physicists, in the belief that a better value of the zero of the balance can be obtained by studying the free swings in this way than by allowing the instrument to come to rest. Instead of adding very small weights to secure the last adjustments, the "rider" is often used. This consists of a tiny weight made of wire, and suspended on the beam of the balance, as indicated at R in Fig. 1. The beam is graduated when a rider is to be used, and the final step in the weighing consists in observing what position the rider must have in order to make the balance perfect. The effect of moving the rider one division on the beam being known by previous experiment, the correction to be applied for any given position of the rider is easily calculated. Obviously the rider can be used with equal advantage whether the weighing is conducted by the method of oscillations or not.

The weights used in connection with precision balances must be accurately compared among themselves if refined work is to be done, and a table of corrections prepared, by means of which the proper allowances may be readily found, for any minute inconsistencies that may exist among them. Reference must be made to the standard works on experimental physics for the details of the process by which these corrections are obtained. Crookes' classical paper on the atomic weight of thallium ('Philosophical Transactions,' (1873, p 277) may also be consulted with advantage, as it contains full details on this point, as well as on many others in connection with accurate weighing. (For further information on the theory and use of the precision balance, see Stewart & Gee, 'Lessons on Elementary Practical Physics,' Vol I, and Glazebrook & Shaw, 'Practical Physics.' Much advanced information may also be had in the 'Travaux et Mémoires' of the International Bureau of Weights and Measures.) See also CHRONOMETER; INDUCTION BALANCE; TORSION BALANCE.

Balance of Power, is the system by which greater states are withheld from absorbing smaller ones. Vattel, in 'Law of Nations,' thus defines it: "By this balance is to be understood such a disposition of things, as that no one potentate or state shall be able absolutely to predominate and prescribe to the others." The system of the balance of power is entirely the outgrowth of the modern political system of Europe, as it began to shape itself in the 15th century; not that it was entirely unknown to the ancients before the irresistible progress of Roman arms put any idea of balance out of the question, but these early efforts after the balance of power were not sustained for a sufficiently long period, from generation to genera-

BALANCE OF POWER

tion, from century to century; were too transitory and casual to entitle them to be elevated into a system. They must be regarded as approaches and tentatives, interesting, but in the end fugitive and unsuccessful. During the latest centuries of the Middle Ages, the kings of France and the emperors of Germany were too much engaged in their domestic struggles with their great vassals, to spare the concentrated attention and energy upon international affairs necessary to originate and sustain a system of balance in Christian Europe. In Italy, then so far in advance of the rest of Europe in intellectual, social, and political development, the princes, podestas, and republics of that peninsula, from an early period of the 15th century, had built up the institution of an equilibrium for their mutual regulation. But this was too local and on too small a scale to be deemed the parent of our modern system. Not until Louis XI. of France had repressed the Dukes of Burgundy and Brittany, not until Ferdinand of Castile and Aragon had united almost the whole of modern Spain under his sway, not until Maximilian in Germany, and Henry VII. in England and Ireland had consolidated the monarchical authority, was the time ripe for the application of this idea. The invasion of Italy by Charles VIII. of France, and his claim to the kingdom of Naples, in 1494, gave rise to the first great European combination of otherwise hostile powers for the repression of the ambition of one. Almost all the Italian states, Maximilian, the German emperor, and Ferdinand of Aragon, suspended their animosities, and drove the French out of Italy. The Emperor Charles V. of Germany, Spain, Burgundy, the Netherlands, and a vast transatlantic empire, 1519-56, caused the jealousy of Europe. Francis I. of France, actually went so far as to ally himself with the sultan, Solyman the Magnificent, against Charles. The Turks at one end of Europe, the kings of France and England at the other, and the opposition of the Protestant princes in the centre, prevented Charles from realizing his ambitious schemes. The misfortunes of Philip II, the son of Charles V., in the Dutch Netherlands and in the expeditions against England and the English power in Ireland, effectually dissipated the fears Europe entertained concerning the overgrown power of the Spanish branch of the house of Hapsburg. The idea of a European equilibrium had now become sufficiently definite for Henry IV. of France to propose to Elizabeth of England, at the commencement of the 17th century, a scheme for a federative congress, whose purpose it should be to maintain the peace of Europe in the same manner as the great powers do now. The idea was impracticable in those days, and was entirely abandoned even as a project, on the assassination of that liberal and high-minded prince. The next potentate whose power gave general alarm and caused a coalition against him in the general interest, was the emperor Ferdinand II. of Germany (reigned 1619-37). Gustavus Adolphus, of Sweden, appealing to the Protestant princes of Germany, subsidized by Richelieu, the French minister, and supplied with men by England and the united provinces of the Netherlands, achieved the task of humbling the power of the house of Austria. After the death of Gustavus, Oxenstiern of Sweden, and Richelieu of France, together forced upon

the German emperor the celebrated Treaty of Westphalia (1648), which relieved Europe from the fear of the house of Austria, and put an end to the Thirty Years' war. The next general danger came from France. The invasion by Louis of the Dutch Netherlands (1672), brought about a coalition of Holland, the emperor of Germany, the elector of Brandenburg, and the king of Spain, against the French king. William, prince of Orange, was the hero of this war; but the Peace of Nimeguen (1678) sealed the supremacy of Louis XIV. The will of the king of Spain nominating the second son of the French dauphin as his successor (1700), thus putting the powerful monarchies of France and Spain into the same hands and utterly destroying the European equilibrium, created the grand alliance and the war of the Spanish succession. The emperor of Germany, the Duke of Savoy, the king of England, and the states-general of the United Provinces, united in this grand alliance. The king of Portugal afterward joined the anti-French confederacy. Marlborough and Prince Eugene of Savoy were the great military leaders in behalf of the balance of power. The Peace of Utrecht (1713), by which the union of the French and Spanish crowns was prevented, and the territorial conquests of France almost wholly surrendered, re-established the influence of the equilibrium doctrine, and secured Europe from danger on this side until the era of the French republic. The Empress Elizabeth, of Russia, was the first Russian potentate who took part in wars in which she had only a remote general interest. Prussia and Russia, celebrated their entry into the rank of first-class powers by dealing the most terrible blow to the balance of power which it has ever suffered. The first partition of Poland (1771-72) is admitted by every writer on this subject to be at war with the fundamental principles on which the equilibrium rests. The achievement of American independence (1783), though not generally reckoned by European writers as belonging to the history of the international balance, may well be included therein, inasmuch as it put an end to the overgrowth of British colonial power and British naval preponderance. At the Congress of Vienna (1814-15), it was the leading wish of Lord Castlereagh, the British plenipotentiary, to restore the kingdom of Poland, as included in the European equilibrium, in which he was seconded by Metternich for Austria, and Talleyrand for the French legitimate sovereign, but opposed by the representatives of the Russian and Prussian monarchies. The return of Napoleon from Elba put an end to this difference, and in the renewed conferences after the battle of Waterloo, the western powers did not insist upon the point. From 1815 to 1853, the world was substantially preserved from any war of importance by the five great powers who then presided over the destinies of Europe, namely, France, Great Britain, Russia, Austria, and Prussia. In 1853, the invasion of the trans-Danubian provinces of the Turkish empire by a Russian army was declared by a congress of the great powers at Vienna to be a breach of the political equilibrium. In this declaration France, Great Britain, Austria, and Prussia agreed. An Anglo-French alliance was made (1854) to repel the aggression, and the confederation of Turkey, Great Britain, and France, was reinforced by the king of Sardinia in the spring of the year

BALANCE OF TRADE—BALANOGLOSSUS

1855. After a war of three campaigns, the Treaty of Paris was signed (30 March 1856), by which Russia abandoned her claims, and the principle of the balance of power was anew vindicated. The Congress of Berlin in 1878, acting in the interests of the balance of power, deprived Russia of many benefits gained through the Treaty of San Stefano. Within a generation, the principle of nationalism has arisen in opposition to that of the balance of power. This is exhibited in United Italy, United Germany, and the spread of Pan-Slavism in Russia, but as a set-off to this may be mentioned the extension of European influence in Asia and Africa as regards colonization and trade. Thus the balance of power has become a world question and such nations as Germany and Italy are desirous of acquiring colonies to balance the colonial possessions of Russia and England. At present the balance of power in Europe is held by the six nations of Great Britain, France, Germany, Austria, Russia, and Italy.

Balance of Trade. The so-called balance of trade is a theory arising from the apparent relation of exports to imports. The protectionist school of political economy holds that excess of exports over imports constitutes what is termed a "favorable balance," which must be returned to us in gold and silver, this being the profit to the nation on its foreign trade. According to this theory the one desirable thing in foreign commerce is the exportation of merchandise. It should be said that all protectionists do not share in a belief in this theory.

In a great measure, and in its more exaggerated form, this doctrine is a survival of the old mercantile theory, which down to the time of Adam Smith controlled most of the legislation relating to commerce, and which held that gold and silver were the only wealth. It still retains a firm hold on the popular mind, but it may be said that the full weight of the teachings of orthodox political economy is against the notion that excess of exports constitutes a favorable balance.

The argument of the latter is that if the theory is true there cannot be too great an excess of exports, and that our imports should therefore consist only of gold and silver. In this "reduction to absurdity" (since a country has no more need of an excessive supply of the metals than of any other commodity) the free-trade school of political economy rejects the conclusions based upon the apparent excess of exports over imports.

Opponents of the theory hold that such trade as exists between two countries, exclusive of what is paid as interest, rent, or tribute, must show a mutual profit, and represent to each a corresponding excess of the value of importation. For illustration: A commodity costing in one country \$75 will be bought in another for \$100, in exchange for a commodity costing \$75 in the country of its exportation and \$100 in the importing country, such difference representing the degree of desirability of these particular commodities to each country. It will be observed that this precisely reverses the "balance of trade" theory.

Countries may be able to show a favorable balance from two causes, neither of which contributes to their prosperity. It may result from an actual drain, as in the case of Ireland, which

is being sapped of its wealth by absentee landlords, and in India, where the same phenomenon is caused by a similar drain in the form of tribute, official salaries spent outside the country, pensions, etc. But in these instances it is clear that there is a condition unprofitable to both countries. Or, on the other hand, it may result, as in the United States, which has the same favorable balance, by reason of the large sums annually paid as interest on loans that entered originally into railroad building, industrial improvements, etc. Most of the royal families of Europe, not to mention less exalted individuals, draw large dividends from American investments. Money spent by American tourists abroad helps to swell this favorable balance.

For proof that this theory has no such relation to national prosperity as its friends conceive, its opponents point to England, whose commercial greatness is rivalled by this country alone, and which has a prevailing "unfavorable" balance, because she has been the money-lender of the world, and her excess of imports represents the return received by her people for moneys invested in foreign lands.

It is impossible to account for the growing increase of our own export balance wholly on the explanation that such excess is rent or interest upon loans. Much of such excess is indeed fictitious, and is to be accounted for by undervaluation of imports and overvaluation of exports. In the latter case there is a strong inducement to overvalue, in order to conceal the fact that many of our exporters are selling goods cheaper abroad than at home. The inducement to undervalue imports is quite as strong. In short, customs statistics, with every desire on the part of the treasury department to be accurate, are of necessity unreliable.

Balanga, *ba-lan'ga*, Philippines, in the province of Bataan, on the western coast of Manila Bay, in the Island of Luzon. It has a post-office and telegraph station. Pop. about 9,000.

Balani'tis, an inflammation of the mucous membrane of the foreskin. It is a common condition and is due to uncleanness. Quacks and charlatans magnify its importance, declare it to be a fearful malady, and promise miraculous cures. Ordinary cleanliness will cause a *balantis* to disappear in a few days. This cannot happen if the local trouble is of a *venereal* nature.

Balanoglossus, a worm-like marine animal, the chief representative of the most primitive class of chordate animals, *Enteropneusta* or *Adelocephala*. This remarkable creature, the type of its class, combines characters peculiar to itself, with features reminding us of the nemerteans, annelids, tunicates, and the vertebrate amphioxus, while its free-swimming larva was originally supposed to be a young echinoderm. From the fact that the central nervous system lies above a notochord, Bateson placed it next to the vertebrates.

One American species, *Balanoglossus aurantiacus*, is a long, cylindrical, soft, fleshy worm, footless, without bristles, but with a large, soft, whitish, tongue-shaped proboscis in front arising dorsally within the edge of the collar surrounding the mouth. The surface of the body is ciliated. At the beginning of the digestive

BALANTIDIUM — BALAWAT

canal is a series of sac-like folds of which the upper or dorsal portion is respiratory and separated by a constriction from the lower, which is digestive, and leads directly to the intestine behind. This pharyngeal respiratory portion of the digestive canal has on each side, in each segment, a dorsal sac, the two communicating along the median line of the body. The dorsal respiratory sacs each bear in their walls a delicate chitinous gill-support or -arch. Between the gill-arches, forming numerous lamellæ, are a series of slits, leading on each side to openings (spiracles), situated dorsally. The water passes through the mouth into each gill-sac, and out by the spiracles. The nervous system lies above a short sac regarded as a notochord. There is a dorsal blood vessel, which sends branches to the respiratory sacs, and a ventral vessel. The worm lives in sand at low-water mark from Cape Ann to Charleston, S. C., also in the Mediterranean.

The life-history of this worm is most interesting. The young, originally described under the name of *Tornaria*, was supposed to be an echinoderm larva, though it resembles the larval *Gephyrea* and *Annelida*. It is a transparent, surface-swimming, minute, ciliated, slender, somewhat bell-shaped form, with black eyespecks. When transforming to the worm condition, a pair of gills arise on sac-like outgrowths of the oesophagus, and afterward three additional pairs, with their external slits, arise, somewhat as in ascidians. The entire *Tornaria* directly transforms into the worm, the transitional period being very short. The body lengthens, the collar and proboscis develop, afterward the body lengthens, the end tapering and becoming much coiled.

Consult: A. Agassiz, 'The History of *Balanoglossus* and *Tornaria*' ('Memoirs of the American Academy of Arts and Sciences,' Vol. IX, Boston, 1873); 'The Later Stages in the Development of *Balanoglossus* Kowalevskii, etc.' ('Quarterly Journal of the Microscopical Society,' London, 1885-6.)

Balantidium, bāl-ān-tid'i-um, a genus of *Infusoria*, some members of which, notably *B. coli* have been found in the large intestine, where they cause symptoms of intestinal derangement, anæmia, peevishness, and other symptoms of an intestinal parasite. The diagnosis is made by means of the microscope. Quinine enemas, five grains to the pint, are usually curative. See **INTESTINAL PARASITES**.

Bal'anus ("acorn-shells"), a genus of sessile cirripeds, family *Balanida*, of which colonies are to be found on rocks at low water, on submerged timbers, crustaceans, shells of mollusks, etc. They differ from barnacles in having a symmetrical shell and being destitute of a flexible stalk. The shell consists of six plates with an operculum of four valves. They pass through a larval state in which they are not fixed, moving by means of swimming-feet which disappear in the final state. All the *Balanida* are hermaphrodites. A South American species (*B. psittacus*) is eaten on the coast of Chile, the *B. tintinnabulum* by the Chinese. The old Roman epicures esteemed the larger species.

Balao, ba-lā'ō, a West Indian name, among Spanish-speaking fishermen, for the half-beaks (q.v.).

Balard, ba-lār, **Antoine Jerome**, French chemist: b. Montpellier, 30 Sept. 1802; d. Paris, 31 March 1876. He was professor of chemistry at the Collège de France, Paris, and discoverer of bromine; also of a process of extracting sulphate of soda directly from sea-water. In 1868 he was made Inspector-General of Superior Instruction.

Balas Ruby, a variety of ruby spinel.

Balashov, bāl-ā-shōf', a Russian town in the government of Saratov, situated on the Don, 170 miles west of the city of Saratov. It has a considerable export trade of grain, etc. Pop. about 13,000.

Balasure, bāl-a-sōr', a city of Bengal, British India, capital of the district of Balasure. It is situated near the coast and has dry docks and a considerable coasting trade. Pop. about 20,000.

Bal'ata, bāl'a-ta, a rubber-like exudate derived from the milky juice of *Mimusops balata* and *M. schomburgkii*. The gum is used widely in the arts, and is sometimes confused with gum chicle, from which much of the chewing-gum of commerce is derived.

Balate, ba-lā'ta, the Philippine name for a kind of trepang (*Holothuria atra*).

Balatka, bālāt-ka, **Hans**, musician: b. Hoffnugsthal, Moravia, 1828. After studying music in Vienna he settled in Milwaukee, Wis., where he founded the Musikverein in 1851, which he conducted for nine years. He then removed to Chicago, where he organized the Liederkrantz, the Mozart Club, and conducted the Philharmonic Society and the Symphony Society.

Balaton, bō'lō-tōn, or **Platten See**, a lake in the southwest of Hungary, extending from lat. 46° 45' to 47° 5' N., and from lon. 17° 14' to 18° 10' E.; area about 110 square miles, or, including the marshy shores, about 138 square miles. It receives the waters of more than 30 small streams. It discharges through the Sio, which empties into the Sarviz, an affluent of the Danube. The Balaton is constantly in a state of motion, sufficient to cause waves. Its waters are perfectly transparent and abound with fine fish, notably one called *fogas*, frequently 20 pounds in weight, and with delicious flesh of snowy whiteness. Another kind, resembling the herring, swarm in the lake during the winter in such shoals that fishermen sometimes haul 50 cartloads from under the ice in a single day.

Balauang, bā-low-äng', Philippines, a town in the province of La Unión, Luzon, north of San Fernando. Pop. about 25,000.

Balau'stion's Adven'tures, a poem by Robert Browning, describing a Greek girl of Rhodes. 'Aristophanes' Apology' is a continuation of this poem.

Balawat, bā-la-wāt', a ruined city of Asiatic Turkey, 10 miles from Nimrud. Excavations there have resulted in the finding of the ruins of the palace of Shalmaneser II. The bronze gates that opened into the vestibule of this palace are especially interesting and valuable, and have been placed in the British Museum.

BALAYAN — BALBOA

Balayan, ba-la'yan, Philippines, a town of Batangas province, Luzon, situated on the Gulf of Balayan, northwest of the town of Batangas. Pop. about 25,000.

Bal'bec. See BAALBEK.

Balbi, bal'bē, **Adriano**, famous geographer: b. Venice, 25 April 1782; d. Padua, 14 March 1848. In 1808 his first work on geography procured his appointment as professor of that science in the College of San Michele, at Murano, and in 1811 he became professor of natural philosophy in the Lyceum at Fermo. Having married an actress, he went in 1820 to Portugal, where he became acquainted with the leading scholars and statesmen. He had free access to the government archives, and from the documents he collected, composed two interesting works entitled 'Essai Statistique sur le Royaume de Portugal et d'Algarve, Comparé aux Autres États de l'Europe,' and 'Variétés Politiques et Statistiques de la Monarchie Portugaise,' which he published at Paris in 1822. He followed his scientific pursuits in that metropolis, and four years later produced the first part of his 'Atlas Ethnographique du Globe, ou Classification des Peuples Anciens et Modernes d'après leurs Langues,' a work of superior arrangement, in which he spread before the French public the result of the researches and disquisitions of the German philologists. He published afterward, in concert with several scientific men, statistical tables of Russia, France, the Netherlands, etc. He now gave all his attention to his 'Abrégé de Géographie Rédigé sur un Plan Nouveau,' a summary of geographical science which appeared in 1832 and has been translated into nearly all the European languages. Then he retired to Padua, where he published, in 1835, his 'Essai sur les Bibliothèques de Vienne.' Beside the works above-cited mention may be made of 'La Monarchie Française Comparée aux Principaux États de l'Europe' (Paris, 1828); 'Balance Politique du Globe' (1828); 'L'Empire Russe Comparé aux Principaux États du Monde' (1829); 'The World Compared with the British Empire' (1830); 'Statistique Comparée de l'Instruction et du Nombre des Crimes' (1829). Balbi was also a contributor to many important publications, 'L'Encyclopédie des Gens du Monde' and 'Le Dictionnaire de la Conversation.' His works show a great amount of knowledge, thorough research, and skilful arrangement of material; but, being utterly deficient in style, they are heavy and of difficult reading; however, they may always be advantageously and safely consulted.

Bal'bi, Gasparo, Venetian dealer in precious stones, who lived in 16th century. He traveled first to Aleppo and thence down the Euphrates and Tigris to the Malabar coast, sailing finally for Pegu, where he remained two years. His 'Viaggio all' Indie Orientale,' published on his return to Venice in 1590, contains the earliest account of India beyond the Ganges.

Balbi, Giovanni, called DE JANUA or JANUENSIS, from his birthplace, Genoa, a Dominican friar, who lived toward the end of the 13th century. He composed a kind of encyclopædia, which he called the 'Catholicon.' This book owes its celebrity principally to the fact

that it has become one of the earliest monuments of the art of printing. The original edition is to be found under the title, 'Summa Grammaticalis valde Notabilis quæ Catholicon Nominatur' (Moguntia, per Johannem Faustum, 1460, fol.). It was reprinted at Augsburg, 1469 and 1472, by Schoeffer; at Nuremberg, 1483, by Koburger; at Venice, 1487, revised and improved, by Pietro Gilles.

Balbi'nus, Decimus Cælius, Roman senator and poet. After the death of the two Gordiani, killed by the soldiers of Maximinus, he was elected emperor by the Senate, concurrently with Clodius Pupienus Maximus, in opposition to the usurper Maximinus. The two emperors reigned little more than one year, and were assassinated by their soldiers 238 A.D.

Bal'bo, bal'bō, **Cesare**, Count, Italian statesman and author: b. Turin, 21 Nov. 1789; d. 3 June 1853. Through the favor of Napoleon he was appointed auditor to the French privy council in 1807, and afterward became secretary to the French commissioners charged with the organization of Tuscany and the Papal States. In 1812 he was promoted to the office of commissioner of Illyria, and after the downfall of Napoleon became secretary of the Sardinian ambassador in London until the outbreak of the Sardinian revolution in 1821, when he returned to his native town in order to devote himself to literary pursuits. He wrote a history of Italy up to the time of Charlemagne, and translated Heinrich Leo's 'Exposition of the Municipal Institutions of Lombardy,' from German into Italian, under the name of 'Comuni Italiani.' His reputation was not firmly established, however, until the latter year, when his 'Speranze d'Italia' made its appearance. His appeal in favor of a national independence found a powerful echo in the popular heart, and paved the way for the revolution in which he was destined to play a prominent part as a champion of the moderate party. His next work, printed at Bastia, in 1849, 'Della Storia d'Italia, dall' Origine Fino al 1814' (History of Italy, from the Beginning to 1814), was not only inspired by the same patriotic spirit, but also distinguished by historical merit. But although in 1848 and 1849 he had strenuously opposed the democratic party and unwaveringly adhered to a more conservative policy, he threw the entire weight of his political influence into the scale of patriotism as soon as the war against Austria began. He supported the different cabinets which governed Sardinia after the promulgation of the constitution of 4 March 1848, and, though for a very short time, was personally connected with the government. He became a regular contributor to the *Risorgimento*, a leading paper of Turin, and in it gave a constant support to D'Azeglio's administration.

Balboa, bāl-bō'a, **Vasco Nuñez**, the discoverer of the Pacific Ocean: b. Jerez de los Caballeros, Spain, 1475; d. 1517. At the age of 25 he went to America to seek his fortune, joining the expedition of Rodrigo de Bastidas (see CENTRAL AMERICA), and returned to Española, (Haiti), after exploring with Bastidas a part of the southwestern coast of the Caribbean Sea. At the town of Salvatierra in Española he became a planter, but with such indifferent success that, when he resolved to attach himself

BALBRIGGAN — BALCONY

to Alonzo de Ojeda's new colony on the mainland of South America, he found difficulty in escaping from his creditors. To elude their vigilance, he hid in a large cask, and thus was carried from his plantation to the landing, and thence on board one of Ojeda's vessels, as a part of the cargo. It is probable that when he emerged from his place of concealment he would have been handed over to the authorities on shore if the expedition had not stood in need of every available fighting-man. Admitted to membership reluctantly, and as a common soldier, Balboa showed his talent for leadership when the undertaking seemed on the point of failure. He suggested transferring the colony to Darien, describing the more favorable conditions there, as he had seen them on his previous voyage. His advice was taken, and the name Antigua (Santa Maria de la Antigua del Darien) was given to the new settlement. Here the Spaniards were somewhat more successful and Balboa assumed command.

In the year 1513 he received a letter from a commissioner whom he had sent to Spain, informing him that he might expect to be summoned to court to answer grave charges. Resolving to win back the royal favor by some striking service, he selected 190 men, the best of his soldiers, and with these and 1,000 native warriors and carriers, and a pack of bloodhounds, sailed from Antigua, 1 September 1513, following the Darien coast westward until he reached a point opposite the Gulf of San Miguel. This gulf extends far into the south coast from the Pacific, narrowing the isthmus to a width of 50 miles. Accurate information in regard to the southern coast, the ocean that lay beyond, and the superior civilization of the Incas of Peru, whose country was to be reached by way of this ocean, had been obtained from the Indians, especially through Balboa's favorite Indian mistress, Fulvia.

The march began 6 September. On the 24th reaching an elevated plateau, the Spaniards repulsed an attack by 1,000 Indians and found supplies in the village of Quarequá. The following day, 25 September 1513, Balboa gained the summit of a mountain from which the waters of Mar del Sur (southern sea) were visible. The name, Pacific, was not applied to this ocean until seven years later, when it was bestowed by Magellan. On 20 September Balboa took formal possession of the "Southern Sea" by marching into the water, and, in the names of the king and queen of Castile, claiming "these seas and lands."

The warning received from the Spanish court was justified in the event. Balboa had already been superseded by Pedrarias. The reward of the former was an empty title of Adelantado of the Southern Sea; while on shore he was made the subordinate of his rival and bitter enemy, Governor Pedrarias. Three years later a South Sea expedition was in prospect, and Balboa, instead of Pizarro, might have been the conqueror of Peru; but the governor's jealousy was aroused, and Balboa was executed at Acla.

MARRION WILCOX,
Authority on Latin-America.

Balbriggan, a watering place in County Dublin, Ireland, 21 miles north of Dublin. It is a seat of linen, cotton, calico, and stocking manufactures. The cotton stockings made here

are remarkable for fineness of texture and beauty of open work. Many women are employed in embroidering muslin.

Balbus, Lucius Cornelius, Roman officer, sometimes surnamed MAJOR, to distinguish him from his nephew (see below): b. Gades, Iberia, in the 1st century. He served his first campaign under Q. Metellus Pius and Pompey. For his conduct in this war the privileges of a Roman citizen were conferred on him, his brother, and his nephews. In 72 B.C. Balbus removed to Rome, and soon became an intimate friend of Cæsar. He was consul in 40 B.C., and is supposed to have been the first adopted citizen to fill that office. He wrote a diary of the chief events in his own and Cæsar's life, and continued Cæsar's 'Commentaries.'

Balbus, Lucius Cornelius (MINOR), nephew of the above, a Roman officer, who in acknowledgment of a victory gained in Africa, was awarded the honor of a triumph, the first ever paid to one not born in Rome.

Balch, George Beall, American rear-admiral: b. Tennessee, 3 Jan. 1821. He was appointed to the navy from Alabama 1837, was promoted passed midshipman 1843, and served through the Mexican war. He was with Commodore Conner's squadron in the first attack on Alvarado, with the mosquito fleet under Commodore Tatnall, and at the bombardment and surrender of Vera Cruz. As a lieutenant on the Plymouth he was with the Asiatic squadron 1851-5, and received a hip wound in a fight between the rebels and imperialists at Shanghai, China. During the Civil War he commanded the Pocahontas and Pawnee, taking part in numerous engagements with the Confederate batteries, chiefly in South Carolina. He became captain, 25 July 1866; commodore, 13 Aug. 1872; rear-admiral, 5 June 1878; and was retired in 1883.

Balcony, a gallery or framework of wood, iron, or stone, projecting from the front of a house, generally on a level with the floors of rooms, and supported on cantilevers or brackets, and sometimes on columns of wood or stone. Balconies are often surrounded by iron railings or stone balustrades. The etymology of the word has been frequently traced to the Greek *βαλλειν*, to throw. This rests upon the presumption that balconies were built originally for purposes of defense, the enemy being attacked with missiles thrown upon him from the balcony. The Latin word is *balcus* or *palcus*, the Italian *balcone*, also *balco* or *palco*, the Turkish *bala-khaneh*, the German *balcon*. The use of balconies is comparatively modern, although there is no doubt about their existence in times of antiquity. Winckelmann, the great German writer upon art, refers to the fact that in Greece every private dwelling-house had contrivances which, although then designated under different terms, would be called balconies in our day. In Spain, Italy, and South America, they are used for sitting, walking, chatting, and flirting, in warm summer evenings; but they are less common in northern countries, where the nature of the climate does not call for such romantic contrivances. They are, however, often used as miniature gardens for potted plants. Upon Boccaccio and Bandello, the great Italian novelists of the 16th century, the poetical utility of balconies was not lost, and entertain-

BALD CYPRESS—BALDUNG

ing balcony scenes abound in their stories. Shakespeare took his plot of Romeo and Juliet from one of Bandello's novels, and the balcony scene exhibits, with that power of genius of which the great English dramatist alone was capable, the beauty of a balcony when two young lovers like Juliet and Romeo make it the witness of their passion.

In modern theatres the term is applied to the first or second gallery or tier of seats above the pit.

Bald Cypress. See CYPRESS.

Bald Eagle, the American white-headed eagle. See EAGLE.

Bald Mountain, the name of several eminences in the United States, of which the following are the principal: (1) In Colorado, height, 11,493 feet; (2) in California, 8,295 feet; (3) in Utah, 11,975 feet; (4) in Wyoming, in the Wind River Range, 10,760 feet; and, (5) in North Carolina, 5,550 feet. The last named was the cause of much excitement in May 1878, because of inexplicable rumblings which lasted for about two weeks. The mountain shook as if in the throes of an earthquake, immense trees and rocks were hurled down its sides, and for a time fears were entertained lest a volcanic eruption should follow. A subsequent examination showed that a large section of the mountain had been split asunder, but no further disturbance occurred.

Baldachin, bäl'da-chîn. See ALTAR.

Balde, Jakob, bal'dä, yä'cöb, German Latin poet: b. Ensheim, Alsace, 1603; d. Neuburg, on the Danube, 1668. He was court-chaplain to the prince electoral of Bavaria, and distinguished himself by the excellence of his Latin poetry. Herder called attention to the beauty and genius of his lyrical productions, many of which he translated.

Balder, bäl'der, or Baldur, in Norse mythology a divinity, represented as the son of Odin and Frigga, beautiful, wise, amiable, and beloved by all the gods. His mother took an oath from every creature, and even from every inanimate object, that they would not harm Balder, but omitted the mistletoe. Balder was therefore deemed invulnerable, and the other gods in sport flung stones and shot arrows at him without harming him. But the evil god, Loki, fashioned an arrow from the mistletoe and got Balder's blind brother Hoder to shoot it, himself guiding his aim. Balder fell dead, pierced to the heart, to the deep grief of all the gods. He is believed to be a personification of the brightness and beneficence of the sun.

Balderstone, bäl'dër-stön, Caleb, the old butler of the master of Ravenswood, in Scott's 'Bride of Lammermoor.'

Baldi, bäl'dë, Benardino, Italian scholar and poet: b. 1553; d. 1617. He was an accomplished linguist and a very prolific writer, and was abbot of Guastalla for 25 years. Among his numerous works are 'Cronica dei Matematici'; 'La Nautica,' a poem on navigation; an Arabic grammar; and a translation of the 'Targum of Onkelos.'

Baldness. Under the title ALOPECIA the general types of baldness have been considered. Premature alopecia, or the general affection of the young and middle-aged, deserves greater

consideration. *Alopecia presenilis*, or premature baldness, is recognized as of two distinct varieties, the idiopathic and the symptomatic. In the idiopathic variety that occurs before the age of 45 there does not seem to be any disease of the scalp or of the general nutrition to explain it. It is a gradual and progressive loss of hair, thinner and thinner hairs replacing those that have fallen out, until the follicle will not produce hair. It is usually symmetrical, beginning at the tonsure or running back from the temples. The skin is usually left thin and hard.

In the symptomatic form some general disorder, or a definite disease of the scalp is the cause. This latter is usually a scaly dandruff; the general causes may be syphilis, tuberculosis, fevers or local destructive conditions. Dandruff (q.v.) is the most frequent accompaniment and cause of baldness. Dandruff is really at least three different diseases of the skin, but the general character is that of a general seborrheal dermatitis; that is, a mild inflammation with excessive fatty secretions. This is frequently due to digestive disturbances, and is closely dependent upon the general health of the entire body. The hair falls out as in the idiopathic form. The dandruff usually continues until the hair is gone, and then ceases.

Treatment should be begun early, particularly in those whose families have tended to baldness. The details of treatment require professional advice. The large number of hair-tonics in the market speaks well for the general inutility of all of them. Cleanliness, frequent dry-brushings, and shampoos once in every two or three weeks, are safe measures, and tend to keep up the general hygiene of the scalp. Consult Jackson, 'Diseases of the Skin' (1900). See DANDRUFF.

Baldo, Monte, a mountain in Lombardy, Italy, near Lake Garda, with an elevation at its highest peak of 7,275 feet.

Baldovinetti, bal'dō-vē-nët'të, Alessio, Florentine artist: b. 1422; d. 1499. Few of his works remain except a 'Nativity' in the Church of the Annunziato, and two altar-pieces in the gallery of the Uffizi and the Academy of Arts, Florence.

Baldpate, or Baldhead, the name of several different birds having a white head, as an eagle, one of the widgeons, a kind of domestic pigeon, a West Indian dove, a fruit-crow, etc.

Baldric, bäl'drik, a belt or sash worn over the right or left shoulder diagonally across the body, often highly decorated and enriched with gems, and used not only to sustain the sword, dagger, or horn, but also for purposes of ornament and as a military or heraldic symbol. The fashion of wearing a baldric appears to have reached its height in the 15th century. In the United States it now forms a part of the uniform of Knights Templar and other fraternal organizations.

Balducci, bäl-dö'chë, Francesco, leading Italian Anacreontic poet: b. Palermo; d. Rome, 1642. He wrote 'Sicilian Songs' in the Sicilian dialect, etc.

Baldung, bäl'dùng, Hans, or Hans Grün, German painter and wood engraver: b. Suabia, 1470; d. Strasburg, 1522. His work, though inferior to Durer's, possessed many of the same

BALDWIN

characteristics, and on this account he has been sometimes considered a pupil of the Nuremberg master. His principal paintings are the series of panels (of the date of 1516) over the altar in Freiburg Cathedral; others of his works are to be found at Berlin, Colmar, and Basel. His numerous and often fantastic engravings have the monogram H. and B., with a small G. in the centre of the H.

Baldwin I., king of Jerusalem. He was the son of Eustace, Count of Bouillon, and accompanied his brother Godfrey of Bouillon into Palestine, where he gained the sovereignty of the state of Edessa. He succeeded his brother on the throne of Jerusalem in 1100, and for 18 years waged war against the Turks, the Arabs, the Persians, and the Saracens. He took many towns and secured for the Christians the coast of Syria from the Gulf of Issus to the confines of Egypt. He died at Laris, in the desert in 1118, and was buried on Mount Calvary. In the first canto of Tasso's 'Gerusalemme Liberata,' the poet has depicted the character of this monarch as well as that of his brother, Godfrey.

Baldwin I., the first Latin emperor of Constantinople, son of Baldwin VIII., Count of Flanders and Hainault: b. Valenciennes, 1170. In 1200 he joined the crusaders with his brother, Thierry, and in 1202 aided the Venetians in their attack upon Constantinople, of which city he was crowned emperor 16 May 1204. In the next year Baldwin was taken prisoner by the king of Bulgaria, and, it is said, died in captivity in 1206. He was much esteemed by the Greeks for his charity, temperance, and justice.

Baldwin II., king of Jerusalem, son of Hugh, Count of Rethel. He was crowned in 1118, after Eustace, brother of Baldwin I., had renounced all claim to the vacant throne. In 1120 he gained a great victory over the Saracens, but in 1124 he was taken prisoner by them, and was ransomed only by giving up the city of Tyre. In 1131 he abdicated in favor of his son-in-law, Foulques of Anjou, and retired to a monastery, where he died in the same year. The military and religious order of the Templars, for the defense of the Holy Land, was instituted, it is thought, in the reign of this monarch.

Baldwin II., the last Frank emperor of Constantinople: b. 1217; d. 1273. He was the son of Pierre de Courtenay, and succeeded his brother Robert in 1228. He was twice besieged in his imperial city, and being too weak to defend his dominions, repaired to Italy to seek aid from the Pope. At the court of France Baldwin was favorably received by the king, St. Louis, to whom he presented a crown of thorns which was held by all Christendom to be the genuine relic. Baldwin, in 1239, set out for Constantinople with a body of crusaders, who, however, soon quitted him and took the route to Palestine. He succeeded, ultimately, in raising new forces in the West, and regained his capital; but in 1261 Michael Paleologus invested it and entered Constantinople on the 29th of July. Baldwin fled to Sicily, where he died in obscurity.

Baldwin III., king of Jerusalem: b. 1130; d. Antioch, 1162. He was son of Foulques of Anjou, whom he succeeded in 1142 under the

guardianship of his mother. He took Ascalon and other places; but under his reign the Christians lost Edessa. He was succeeded by his brother, Amaury I.

Baldwin IV., king of Jerusalem: d. 1185. He was son of Amaury, and succeeded to the throne on the death of his father in 1174; but as he was leprous, Raymond, Count of Tripoli, governed the kingdom for him. He afterward resigned the throne to his nephew, Baldwin V., in 1183.

Baldwin V., king of Jerusalem: b. 1178; d. 1186. He was son of Sibylla, sister of Baldwin IV., and was called to the throne when five years old. He died of poison, supposed to have been administered by his mother in order that her second husband, Guy de Lusignan, might enjoy the throne. The following year, 1187, the Christians lost Jerusalem, which was taken by Saladin.

Baldwin, Abraham, American statesman: b. Guilford, Ct., 6 Nov. 1754; d. 1807. He was graduated at Yale in 1772, and was tutor there, 1775-79. During the American Revolution he was a chaplain in the army, and, at the suggestion of General Greene, settled in Savannah, Ga., 1784, where he was admitted to the bar. His efforts as a member of the legislature secured a charter and endowment for the University of Georgia, which was established according to his own plans and ideas, and of which he became president. He took part in the Constitutional Convention of 1787; was a delegate to the Continental Congress 1785-88; member of the House of Representatives 1789-99; United States senator 1799, until his death.

Baldwin, Charles H., American naval officer: b. New York city, 3 Sept. 1822; d. 17 Nov. 1888. He entered the navy as a midshipman in 1839. Serving on the frigate Congress during the war with Mexico, he figured in several sharp encounters near Mazatlan. He commanded the steamer Clifton at the passage of Forts Jackson and St. Philip in 1862, and at the first attack on Vicksburg. He became rear-admiral in 1883, receiving the command of the Mediterranean squadron, and was retired in 1884.

Baldwin, Evelyn Briggs, arctic explorer: b. Springfield, Mo., 22 July 1862. He was graduated from Northwestern College, Naperville, Ill., and engaged chiefly in teaching until 1892, when he entered the United States Weather Bureau service. He is now an inspector-at-large of the signal corps of the United States army. He accompanied, as meteorologist, Peary's North Greenland expedition, 1893-4; joined the Wellman Polar expedition, 1898-99, as second in command, built Fort McKinley, and discovered Graham Bell Land. Securing the co-operation of Mr. William Ziegler of New York he organized and commanded the Baldwin-Ziegler expedition of 1901. He has written 'The Search for the North Pole,' 'Auroral Observations, Franz-Joseph Land,' 'Meteorological Reports of the North Greenland Expedition' (1893-4), and meteorological publications in government reports.

Baldwin, Frank D., American military officer: b. Michigan, 26 June 1842. He entered the volunteer army in 1861 and the regular army in 1866; became colonel of the 4th United

BALDWIN

States Infantry, 26 July 1901; and was promoted brigadier-general, United States army, 9 June 1902. He was awarded a Congressional medal of honor for service at the battle of Pine Tree Creek, Ga., 20 July 1864, and another for gallantry in an action against Indians in Texas. He greatly distinguished himself in the Philippines in the early part of 1902.

Baldwin, Foy Spencer, American educator: b. Charlotte, Mich., 6 July 1870. He was graduated at the Boston University in 1888; spent 1892-3 studying economics in Germany; and became professor of economics in Boston University in 1895. Among his publications is 'History of Mining Legislation in England.'

Baldwin, Henry Porter, American politician: b. Coventry, R. I., 22 Feb. 1814; d. Detroit, Mich., 31 Dec. 1892. He went to Michigan in his youth and from 1869 to 1873 was governor of the State. From 1879 to 1881 he sat in the United States Senate. He was very prominent in the affairs of the Episcopal Church in Michigan.

Baldwin, James, American author: b. Hamilton County, Ind., 15 Dec. 1841. Very largely self-taught, he was engaged in teaching from 1865 to 1887. He filled an editorial position with Harper & Bros. 1887-93, when he became editor of school books for the American Book Co. He has written: 'Story of Siegfried' (1882); 'Story of Roland' (1883); 'Six Centuries of English Poetry' (1892); 'Old Greek Stories' (1895); 'Guide to Systematic Readings in the Encyclopædia Britannica' (1895); 'The Discovery of the Old Northwest,' and compiled or edited many other works.

Baldwin, James Mark, American psychologist: b. Columbia, S. C., 12 Jan. 1861. He was educated at Princeton College, Leipsic, Berlin, and Tübingen universities; was instructor of German and French at Princeton 1886-87; professor of philosophy in Lake Forest University 1887-89, and in the University of Toronto 1889-93; and professor of psychology at Princeton University since 1893. He was vice-president of the International Congress of Psychology at London 1892; honorary president of the International Congress of Criminal Anthropology at Geneva 1896; president of the American Psychological Association 1897-98; judge of award at the World's Columbian Exposition 1893; was awarded a gold medal by the Royal Academy of Arts and Sciences of Denmark, in 1897, for the best work on the general question of social ethics; and was elected a member of the Institut International de Sociologie 1898. He is author of 'Handbook of Psychology' (2 vols., 1889-91); a translation of Ribot's 'German Psychology of To-day' (1886); 'Elements of Psychology' (1893); 'Social and Ethical Interpretations in Mental Development' (1897), etc. He was also one of the founders of the 'Psychological Review,' editor-in-chief of the 'Dictionary of Philosophy and Psychology,' and a contributor of articles on psychology to 'Johnson's Universal Cyclopædia' (1892-95).

Baldwin, John Denison, American journalist, politician, poet, and writer on archæology: b. North Stonington, Conn., 28 Sept. 1809; d. 8 July 1883. After studying law and theology he entered journalism, was long editor and

proprietor of the Worcester *Spy*, and was a member of Congress 1863-69. He wrote 'Raymond Hill, and Other Poems' (1847); 'Pre-historic Nations' (1869), and 'Ancient America' (1872).

Baldwin, Joseph G., American jurist: b. Sumter, Ala. 1815; d. 30 Sept. 1864. He was a judge of the superior court of California in 1857-63; chief justice of the State from 1863 till his death, and author of 'Party Leaders' and 'Flush Times in Alabama and Mississippi.'

Baldwin, Maurice Scollard, Canadian clergyman: b. Toronto, 21 June 1836. He was graduated at Trinity College in that city 1862; became rector of St. Luke's Church in Montreal, was dean of Montreal 1882-83; and in the last year was made Bishop of Huron. He published 'Break in the Ocean Cable' 'Life in a Look,' etc.

Baldwin, Robert, Canadian statesman: b. Toronto, 12 May 1804; d. there, 9 Dec. 1858. He began to practise law in 1825, and four years later became a member of the Assembly of Upper Canada. He was solicitor-general in 1840 and premier and attorney-general of Upper Canada 1842-43. He was long prominent as a Reform leader in Canada, but retired from office in 1851.

Baldwin, Simeon Eben, American jurist: b. New Haven, Conn., 5 Feb. 1840. He is a great-grandson of Roger Sherman, a signer of the Declaration of Independence, and great-great-grandson of President Clap, of Yale. His father was a United States senator and governor of Connecticut. Judge Baldwin graduated from Yale 1861, and from the Harvard Law School 1863. Settling in New Haven he rapidly acquired a large general practice, in which he continued until 1893. Since 1872 he has held a professorship in the Yale Law School, and since 1893 he has been an associate justice of the Connecticut supreme court of errors. As a legal writer he has a wide reputation in the United States and abroad, through his contributions to leading law journals. He is the author of 'Digest of Connecticut Reports' (2 vols. 1871-82; revision, 2 vols. 1900); 'Illustrated Cases on Railroad Law'; and 'Modern Political Institutions' (1899).

Baldwin, Stephen Livingston, American missionary: b. 1835; d. 1902. He went to China as a missionary under the auspices of the Methodist Episcopal Church, and on his return to the United States he held several pastorates. While in China he translated a large part of the Bible into Chinese, and, it is said, printed the first copy of the Bible in that language.

Baldwin, Theodore A., American military officer: b. New Jersey, 21 Dec. 1839. He entered the army as a private 3 May 1862, and served in that grade and as quartermaster-sergeant in the 19th U. S. Infantry till 31 May 1865, when he became first lieutenant. He was promoted captain 23 July 1867; major, 7th Cavalry, 5 Oct. 1887; lieutenant-colonel, 10th Cavalry, 11 Dec. 1896; and colonel, 7th Cavalry, 6 May 1899. From 6 Oct. 1898 till 31 Jan. 1899 he served as a brigadier-general of volunteers.

Baldwin, Thomas, Baptist minister: b. Norwich, Conn., 23 Dec. 1753; d. 29 Aug. 1825. His early culture was very limited; yet he acquired a reputation for scholarship. At an

early age he removed to Canaan, N. H., where, becoming converted, he joined the Baptist Church in 1781 and became one of the most energetic supporters of its tenets, and one of the ablest advocates of its civil rights. In 1782 he was licensed to preach, and in 1783 was ordained pastor of the church in Canaan, serving for seven years. In 1790 he was called to the Second Baptist Church of Boston and served there till his death. He took a prominent part in the establishment of Waterville College, Me., and of Columbian College, Washington, D. C. He was several times elected to the State legislature and was a member of the convention of 1821 to revise the Massachusetts Constitution. He published a volume in defense of Baptist tenets.

Baldwin University, a co-educational institution in Berea, O.; organized in 1846 under the auspices of the Methodist Episcopal Church; reported at the end of 1899: Professors and instructors, 23; students, 276; volumes in the library, 7,000; grounds and buildings valued at \$120,000; productive funds, \$81,000; income, \$9,000; number of graduates, 405; president, Rev. R. M. Freshwater.

Baldwinsville, N. Y., town in Onondaga County, on the Delaware, L. & W. railroad; and on the Seneca River; 12 miles from Syracuse. There is excellent water-power here and varied manufactures. The town has an academy, graded schools, and six churches. It was first settled in 1807. In 1815 it was known as Baldwin's Bridge. Pop. (1900) 2,992.

Bale, John, an English ecclesiastic: b. Suffolk, 1495. Although educated a Roman Catholic, he became a Protestant, and had to take refuge in the Netherlands. On the accession of Edward VI. he returned to England, was presented to the living of Bishop's Stoke, Southampton, and soon after was nominated Bishop of Ossory, in Ireland. Here, on preaching the reformed religion, popular fury reached such a pitch that in one tumult five of his domestics were murdered in his presence. On the accession of Mary he lay some time concealed in Dublin. After enduring many hardships he was enabled to reach Switzerland, where he remained till the death of Mary. On his return to England he contented himself with the calm enjoyment of a prebendal stall at Canterbury, where he closed his stormy life in 1563. He was so bitter a controversialist that he earned the title of "Bilious Bale." The only work which has given him distinction among authors is his *Scriptorium Illustrium Majoris Britanniæ Catalogus*; or *'An Account of the Lives of Eminent Writers of Britain.'* This account, which, according to the title, commences with Japhet the son of Noah, reaches to the year 1557, at which time the author was an exile on the Continent. It is compiled from various writers, but chiefly from the antiquary Leland.

Bâle, bâl. See BASEL.

Bale-fire, in its older and strict meaning, any great fire kindled in the open air, or, in a special sense, the fire of a funeral pile. It has frequently been used as synonymous with beacon-fire, or a fire kindled as a signal, Sir Walter Scott having apparently been the first to employ it in this sense; and it has at various times,

with even less reason, been confounded with "bale" in the sense of evil or fatal.

Baleáric (bäl-ē-är'ik) Crane. See CRANE.

Bal'earic Islands, a group of five islands, southeast of Spain, including Majorca, Minorca, Iviza, and Formentera. The popular derivation of the ancient name *Baleares* (Greek *ballein*, to throw), has reference to the reputed of the inhabitants for their skill in slinging, in which they distinguished themselves both in the army of Hannibal and under the Romans, by whom the islands were annexed in 123 B.C. After being taken by the Vandals under Genserich, and in the 8th century by the Moors, they were taken by James I., king of Aragon, 1220-34, and constituted a kingdom which in 1375 was united to Spain. The islands now form a Spanish province, with an area of 1,860 square miles. Pop. (1897) 306,926.

Baléchou, ba-lā-shoo, Jean Jacques Nicolas, celebrated French engraver: b. Arles, 1715; d. Avignon, 18 Aug. 1765. His full-length portrait of Augustus, king of Poland, has been proclaimed the masterpiece of the kind in the 18th century. But Baléchou dishonestly sold the best proofs for his own benefit, and was consequently expelled from the Academy of Fine Arts.

Baleen'. See WHALEBONE.

Baleen Whales, the group of whales whose mouths are furnished with a growth of baleen or whalebone (q.v.). They form a sub-order *Mysticeti* of the *Cetacea*, which includes the families *Balanopteridæ* or rorquals, and *Balaenidæ*, the right whales. These whales are known in all oceans and form an important object of the chase. See HUMPBACK; RIGHT WHALE; RORQUAL; WHALE; etc.

Bal'er, Philippines, a town in the northeast part of Luzon. The population is several thousand, mostly natives. The most conspicuous edifice is a native Catholic church. The town is noted for the heroic defense of a Spanish garrison in 1899, during a siege by the Filipinos, lasting 11 months. The Spaniards were commanded by Lieut. Saturnino Martin Cerezo, who refused to surrender the town, even when directed to do so by his superiors in Manila. He entrenched himself in the church and heroically resisted the besiegers until his supplies gave out, when he surrendered with all the honors of war, July 2, 1899. Baler was occupied by the American troops and garrisoned with two companies of the 34th Volunteer Infantry, under Major Shunk, in March 1900.

Bales, Peter, a famous English calligrapher: b. 1547; d. about 1610. His skill in micrography is referred to by Holinshed and Evelyn. He was one of the early inventors of shorthand, and is said to have been employed to imitate signatures by Secretary Walsingham.

Balestier, bäl-ēs-tēr', Charles Wolcott, American novelist: b. Rochester, N. Y., 13 Dec. 1861; d. 6 Dec. 1891. He studied at Cornell University, and became connected with a New York publishing house. His writings, which deal largely with frontier life in Colorado, include *'The Naulahka'*, written in collaboration with Rudyard Kipling, his brother-in-law; *'Benefits Forgot'* (1892), and a *'Life of James G. Blaine.'*

BALESTRA — BALFOUR

Balestra, ba-lës'tra, **Antonio**, an Italian painter: b. Verona, 1666; d. there, 21 April 1740. He became a pupil of Belucci, in Venice, and subsequently studied in Rome under Carlo Maratti. He executed the 'Defeat of the Giants,' which took the prize at the Academy of St. Luke in 1694. In 1695 he left Rome for Venice, where he became the head of a school, and counted many distinguished names among his pupils. His works are found in many of the galleries and churches of northern Italy. Among his paintings are 'Saint Theresa,' at Bergamo, a 'Virgin,' at Mantua; and a portrait of himself, at Florence. He was among the last of the Venetian school of artists.

Balfe, bäl'f, **Michael William**, British composer: b. Dublin, 15 May 1808; d. 20 Oct. 1870. He received his first instructions in music from his father and Charles Horn. In his 7th year he performed one of Viotti's concertos before the public; at 16 he performed the part of the Wicked Huntsman in 'Der Freischütz' at Drury Lane. In 1825 he went to Italy, wrote the music for a ballet, 'La Peyrouse,' for the Scala at Naples, and in the following year fulfilled an engagement to sing at the Théâtre-Italien, Paris, with moderate success. He returned to Italy, and at Palermo (1830) his first opera, 'I Rivali,' was produced. For five years, with somewhat careless haste, he continued singing and composing sundry operas for the Italian stage, which are now forgotten. In 1835 he came to England and had his 'Siege of Rochelle' brought out at Drury Lane. It hit the popular taste, and was quickly followed by others equally successful in this respect. Part of this success was no doubt due to the great artists who took the leading characters, Malibran, Grisi, Lablache, Rubini, and other stars of that time; but the works had high merits of their own, being marked by brilliancy, melody, and fertility of invention. In 1846 he was appointed conductor of the London Italian Opera. If Balfe was wanting in depth and dramatic force, he had a very thorough knowledge of effects and command of orchestral resources; and his compositions are distinguished by fluency, facility, and melodic power. His operas continue popular in England and elsewhere, among the chief being 'The Bohemian Girl' (the most popular of all), 'The Rose of Castile'; 'The Daughter of St. Mark'; and 'Satanella.' His posthumous opera, 'The Talisman,' was brought out in London in June 1874, with great success.

Balfour, bäl'foor, or bäl'fer, **Alexander**, Scottish novelist and poet: b. Monikie, 1 March 1767; d. 12 Sept. 1829. He was a frequent contributor to periodicals, and was author of 'Campbell; or the Scottish Probationer' (1819); 'Contemplations, and Other Poems' (1820); 'Farmer's Three Daughters' (1822); 'The Foundling of Glenthorn; or the Smugler's Cave' (1823); 'Highland Mary' (1827), etc.

Balfour, Sir **Andrew**, Scottish botanist and physician: b. Fifeshire, 1630; d. 1694. After completing his studies at St. Andrews and London, and traveling on the Continent, he settled at Edinburgh, where he planned, with Sir Robert Sibbald, the Royal College of Physicians, and was elected its first president. Shortly before his death he laid the foundation of a hospital in Edinburgh, which, though at

first narrow and confined, expanded into the Royal Infirmary. His familiar 'Letters' were published in 1700.

Balfour, Right Hon. **Arthur James**, English statesman: b. Scotland (son of Mr. Balfour of Whittinghame, Haddingtonshire, and a daughter of the second Marquis of Salisbury) 25 July 1848. He was educated at Eton and Trinity College, Cambridge, where he took his M.A. degree in 1873. He entered Parliament in 1874, sitting for Hertford from that time till 1885, since which he has represented East Manchester. He acted as private secretary to his uncle the Marquis of Salisbury at the Foreign Office during the period to which the Berlin Treaty belongs (1878-80), and accompanied him to Berlin. He was president of the Local Government Board from June 1885 till the beginning of the following year, and from July 1886 till March 1887 he discharged the duties of secretary for Scotland. He showed much ability as chief secretary for Ireland 1887-91, passing the Crimes Act and the Law Act, securing a free grant for railways, and creating the Congested Districts Board, but resigned this post in order to succeed Mr. W. H. Smith, who had lately died, as leader of the House of Commons and first lord of the treasury. On the defeat of the Unionist party at the general election in 1892 he relinquished this office, but returned to it when the Unionists again came into power in the autumn of 1895. On the resignation of Lord Salisbury 12 July 1902 Mr. Balfour became prime minister. In 1886 he was elected lord rector of St. Andrews University, in 1890 the Glasgow students did him similar honor and in 1888 he became a Fellow of the Royal Society. The biometallists found in him a supporter and he acted as chairman of the commission on the subject in 1887. He is an enthusiastic golfer, and contributed to the volume on golf in the Badminton Series. In 1879 he published 'A Defense of Philosophic Doubt'; in 1893 a volume of 'Essays and Addresses'; and in 1895 'The Foundations of Belief, being Notes Introductory to the Study of Theology.'

Balfour, Francis Maitland, embryologist: brother of the foregoing, b. 1851. He studied at Harrow and Trinity College, Cambridge. Articles on his special study gained him a high reputation while still an undergraduate, and after further work at Naples he published in 1874, in conjunction with Dr. M. Foster, 'Elements of Embryology, a valuable contribution to the literature of biology. He was elected a fellow of his college; fellow and member of council of the Royal Society; lecturer on, and finally, in 1882, professor of, animal morphology at Cambridge, a chair specially instituted for him. The promise of his chief work, 'Comparative Embryology' (1880-1) was unfulfilled, as 19 July 1882 he was killed by a fall on Mont Blanc.

Balfour, Right Hon. **Gerald William**, English statesman: b. 1853 (brother to the two preceding). He was educated at Eton and Trinity College, Cambridge, entered Parliament in 1885, and became chief secretary for Ireland in the Unionist ministry of 1895. In this capacity it fell to him to pilot the important Irish Local Government Bill of 1898 through the House of Commons.

ARTHUR J. BALFOUR.

BALFOUR—BALILING

Balfour, Isaac Bayley, Scottish botanist: b. Edinburgh, 31 March 1853. He was professor of botany in the University of Glasgow 1879-84, at Oxford University 1884-88, and since 1888 at the University of Edinburgh. He explored the island of Socotra in 1880, in behalf of the British Association and of the Royal Society of Edinburgh. He is King's botanist in Scotland and keeper of the Royal Botanic Garden in Edinburgh.

Balfour, Sir James, Scottish lawyer, and a conspicuous actor in the civil wars which ended in the dethronement of Mary, Queen of Scots: b. Fifeshire, Scotland, about the beginning of the 16th century; d. 1583. Originally brought up in the Roman Catholic Church, he had espoused the Protestant cause, and in 1547, for his share in the conspiracy against Cardinal Beaton, he was, with Knox and other reformers condemned to the galleys. After his escape and return to Scotland, the cause of Protestantism was apparently declining, and Balfour abjured his heresies and returned to his former faith. His abilities and tact gained him appointments and he was high in office on the arrival of Mary in Scotland, and was with the queen at Holyrood on the night of Rizzio's assassination. Popular rumor assigned to Balfour a prominent share in the murder of Lord Darnley, Mary's husband, but he contrived to outlive all suspicion. In 1567 he was appointed captain of Edinburgh castle. A change in Balfour's convictions was forced upon him, for he saw that a powerful party had been formed against Mary and the policy of an alliance with them overcame all scruples. He held the castle of Edinburgh against the queen, and was the means of delivering up Mary's letters into the hands of her enemies. He afterward surrendered the castle for various considerations. On the breaking out of the civil war Balfour sided with the regent Murray, but after Mary's imprisonment in England he took part in conspiracies for her restoration, although at the time professing adherence to the regents Murray and Morton. His last public act was furnishing the evidence of Morton's guilt in the murder of Darnley, for which Morton was condemned and executed. The 'Practicks of Scots Law' attributed to him, continued to be used and consulted in manuscript for nearly a century until it was supplanted by the 'Institutes of Lord Stair.'

Balfour, James, Canadian architect: b. Hamilton, Ont., 1852. He acquired his education in Canada and Edinburgh and began the practice of his profession in his native city. Among notable buildings of his designing are the Boys' Home and City Hall, in Hamilton; Alma Ladies' College, St. Thomas; and the Museum of Art, Detroit, Mich.

Balfour, John (OF KINLOCK, OR OF BURLEY), one of the chief actors in the assassination of Archbishop Sharp in 1679, for which his estate was forfeited and a price set on his head. He fought at Drumclog and Bothwell Bridge, and is said afterward to have escaped to Holland. According to one account he died on a homeward voyage to Scotland; by another he never left the country, but settled in the parish of Roseneath, Dumbartonshire. He is described by Scott in 'Old Mortality.' Balfour of Kinlock is quite a different personage from Lord

Balfour of Burleigh, who succeeded to the title in 1663, spent his youth in France, and died in 1688.

Balfour, John Hutton, Scotch botanist: b. Edinburgh, 15 Sept. 1808; d. 11 Feb. 1884. He graduated at Edinburgh University in arts and in medicine, in 1841-5 was professor of botany in Glasgow University; and in the latter year removed to Edinburgh to occupy a similar post, resigning his chair in 1879. He wrote valuable botanical text-books, including 'Elements,' 'Outlines,' 'Manual,' and 'Class-book,' beside various other works.

Balfour, Nesbit, British military officer: b. Dunbog, Scotland, 1743; d. same place, October 1823. He was promoted lieutenant-general 1798 and general 1803; distinguished himself during the American Revolution; was wounded in the battle of Bunker Hill; fought at the battles of Elizabethtown, Brandywine, Germantown, and Long Island; and was present at the capture of New York. He was appointed commandant at Charlestown in 1779.

Balfrush, bāl-frōōsh', or **Barfurush** ('mart of burdens'), a town in the Persian province of Mazanderan, on the river Bhawal, 12 miles from the Caspian Sea. Balfrush is a centre of trade between Russia and Persia, exporting large quantities of silk, rice, and cotton, while the Russians supply iron and naphtha. It has excellent bazaars, numerous caravanserais, and several Mohammedan colleges. Pop. about 50,000.

Balg, bālg, **Gerhard Hubert**, philologist: b. Scandinavia, about 1850. He graduated at the University of Wisconsin, and resides at Mayville, in that State. He has translated W. Braune's 'Gothic Grammar, with Selections and Glossary' (1883); edited 'The First Germanic Bible, and Other Remains of the Gothic Language with Introduction and Glossary' (1891); and compiled 'A Comparative Glossary of the Gothic Language, with Especial Reference to English and German' (1887-9).

Bali, ba'lē, or **Bally**, an island of the Indian Archipelago, belonging to Holland, and lying east of Java. Its greatest length is 85 miles; breadth, 55 miles; area, about 2,260 square miles. It consists chiefly of a series of volcanic mountains, of which the loftiest, Agoong (11,326 feet), became active in 1843 after a long period of quiescence. Principal products, rice, cocoa, coffee, indigo, cotton, etc. The people are akin to those of Java and are mostly Brahmans in religion. It is divided into eight provinces under native rajahs, and forms one colony with Lombok, the united population being estimated, in 1897, at 1,044,757.

Balikesri, bā-lē-kēs'rē, **Balu-kissar**, or **Balik-Shehr**, a town of Anatolia, 75 miles southwest from Brusa. It is built of unburnt bricks and contains the tomb of a celebrated Mohammedan saint and a manufactory of felt cloth for military clothing. It has considerable trade in silk fabrics. Pop. over 12,000.

Ba'liling, a principality of the island of Bali; pop. 130,000. The exports are rice and bullocks, and the chief trade is with the Bughis of Celebes. In 1847 the Dutch were signally defeated in an attack upon the fort of Djaga Raga in this principality.

BALINAG — BALKAN PENINSULA

Balinag, ba-le-nag', Philippines, a town of the province of Bulacan, Luzon. Pop. (1898) 14,122.

Baliol, bā'li-ōl, **Edward**, a king of Scotland, son of John Baliol of Scotland; d. Doncaster, 1363. In 1322 he made a successful invasion of Scotland and on 24 September of that year was crowned king of Scotland at Scone. Having privately rendered homage to Edward III. of England, he was routed by a party of Scottish nobles and dispossessed of his crown after a reign of three months. He regained it the next year, but was henceforth an instrument of Edward.

Baliol, or **Balliol**, **John**, king of Scotland: b. about 1249; d. 1315. On the death of Princess Margaret of Norway, grandchild of Alexander III., in 1290, Baliol claimed the vacant throne by virtue of his descent from David, Earl of Huntingdon, brother to William the Lion, king of Scotland. Robert Bruce (grandfather of the king) opposed Baliol; but Edward I.'s decision was in favor of Baliol, who did homage to him for the kingdom, 20 Nov. 1292. Irritated by Edward's harsh exercise of authority, Baliol concluded a treaty with France, then at war with England; but, after the defeat at Dunbar, he surrendered his crown into the hands of the English monarch. He was sent with his son to the Tower, but, by the intercession of the Pope in 1297, obtained liberty to retire to his Norman estates, where he died.

Baliol, or **Balliol**, **John**, father of King John Baliol, an English baron in the reign of Henry III.: d. 1269. In 1263 he laid the foundation of Balliol College (q.v.), Oxford, which was completed by his widow, Devorgilla or Devorgilla. She was daughter and co-heiress of Allan of Galloway, a great baron of Scotland, by Margaret, eldest daughter of David, Earl of Huntingdon, brother of William the Lion. It was on the strength of this genealogy that his son, John Baliol, became temporary king of Scotland.

Baliol, **Martha Bethune**, the imaginary narrator of several of Sir Walter Scott's 'Chronicles of the Canongate.'

Baliol College. See BALLIOL COLLEGE

Balisarda, ba-lē-sār'da, a magic sword in Ariosto's 'Orlando Furioso,' stolen from Orlando by Brunello, and afterward given to Rogero.

Balisaur, bāl-ī-sā'oor (Hindu, *balloosoor*), the sand-badger of India, called by Hindus the pig-like badger or "sand-hog," on account of its long snout. See SAND-BADGER.

Balis'ta, or **Ballista**, a machine used in military operations by the ancients for hurling heavy missiles, thus serving in some degree the purpose of the modern cannon. The motive power appears to have been obtained by the torsion of ropes, fibres, catgut, or hair. They are said to have sometimes had an effective range of a quarter of a mile, and to have thrown stones weighing as much as 300 pounds. *Balis'ta* differed from *catapulta*, in that the latter were used for throwing darts.

Balize, ba-lēz'. See BELIZE.

Balkan bāl-kān', or bāl'kān, **Mountains**, (anciently called *Hæmus*), a lofty and rugged mountain range, extending from Cape Emineh Burum on the Black Sea, in eastern Roumelia, in a westerly direction to the borders of Servia, and forming the southern boundary of the basin of the Danube. In the west it is connected with the much ramified mountain-system of the south-eastern peninsula of Europe. Its length is over 200 miles; the average elevation is about 3,000 feet, but the group of the Khoja Balkans in the west have a mean height of 6,500 feet. The highest summit is Jumrukchal, 7,786 feet. The Balkan forms the watershed between the streams flowing northward into the Danube, and those flowing southward to the Ægean. The chief of the latter is the Maritza. The range, which has a gradual descent on the north, presents on the south a somewhat steep escarpment, and has always been considered the greatest natural bulwark of the Ottoman empire against enemies on the European frontiers. Yet in the Russo-Turkish war of 1877-8 the Russian troops managed to cross it without any great difficulty, although they had to encounter a stubborn resistance at Shipka Pass (4,370 feet). Here a Turkish army of 32,000 men surrendered to the Russians. The range now forms the southern frontier of Bulgaria, dividing it from eastern Rumelia. The whole of the southeastern peninsula of Europe is known as the Balkan Peninsula.

Balkan Peninsula, a region thus named after the Balkan (Turkish "high ridge"), the ancient *Hæmus* (Greek *ὁ Ἄλπος*) an important mountain range in southeastern Europe. It is the southeasternmost of the three great southern peninsulas of Europe, each of which is named after the central mountain system forming its backbone; namely, the Tyrenean, the Apennine, and the Balkan peninsulas. The northern boundary of the latter is not as clearly defined as that of the other two great peninsulas separated from central Europe by the gigantic mountain barriers of the Pyrenees and the Alps. Assuming that rivers also form a natural boundary, the Balkan Peninsula ends on the right bank of the Danube and her tributaries, the Save and the Una; it is bounded on the west by the Adriatic and the Ionian seas, on the east by the Black or Euxine and the Ægean. In a broader designation, however, the northern boundary is assumed to be the parallel of 45° N., adding to the peninsula more than one half of Rumania (Wallachia and Dobrudja) and a part of Austria (Dalmatia and a section of Croatia). Excluding the territory between 45° N. and the Danube, the peninsula comprises an area of about 175,000 square miles, which contains European Turkey proper with Novibazar, a Turkish district under Austrian military control. Bosnia, and Herzegovina (temporarily occupied by Austria; Montenegro, Servia, Bulgaria, an autonomous and tributary principality, with eastern Rumelia, under the suzerainty of Turkey and Greece. No other country in Europe is so richly provided with gulfs and excellent harbors of commercial and naval strategic value. An archipelago of numberless islands, the Cyclades and Sporades of ancient fame, forms a continuous bridge between the Balkan Peninsula and Asia Minor. The Black Sea is connected with the Sea of Marmora through the Bosphorus,

BALKH

a channel about 20 miles long, and so narrow that Constantinople, at the southwest extremity of the Thracian Bosphorus, is but one mile distant from the Asiatic city of Scutari, eastward across the Bosphorus. The Sea of Marmora is linked with the Ægean by the Dardanelles with an average width between three and four miles. The Balkan Mountains, a continuation of the Carpathian Mountain system, extend in a varied formation from the Adriatic to the Euxine, breaking up in their advance eastward into several parallel chains with many more or less, strong spurs north and south; several ranges extend southward almost to the Ægean: the Perim Dagh and the ancient Rhodope Mountains or Despoto Dagh. They are frequently broken by defiles or passes of a different degrees of serviceableness as routes. The principal passes are the Nadir-Derbend, Karnabad, the Basardshik-Sophia, the Trajan, Rosalitha, and Shipka, the latter famed by the heroic struggles between the Russians and Turks in 1877. The principal range of the Balkans is thus divided into several sections, like the Etropol, Kodja, and Shipka Balkans, and forms the boundary between Bulgaria and Rumelia. The main elevation of the chain is from 4,000 to 5,000 feet, but it rises much higher in various parts, the loftiest elevation of 9,700 feet above sea-level being reached by Mount Scargus in the Char Dagh. The Balkans are rich in minerals, especially rock salt, lead, iron-ore, copper, silver, but the treasures of the soil are yet very imperfectly known in spite of the geological researches, undertaken by German, French, and other travelers and scientists. The mountains are mostly of a granite formation, but the mountain system is very complicated, and its geologic and geostatic connections are hard to determine. There are numerous thermal and sulphurous springs, some of which are renowned and utilized as sanitary watering places. The mountains form the watershed separating the tributaries of the lower Danube and those of the Vardar and Maritza rivers, or, in other words, the watershed between the Black Sea and the Ægean. On account of the broken and irregular character of the peninsula the rivers are short and little navigable. The westernmost section of Turkey, Albania, separated from Montenegro and Novibazar by the North Albanian Alps, is a mass of parallel mountain ranges, irregularly traversed by the winding rivers, Boyana, Drin, Loum, Voitza, and Arta, which flow into the Adriatic and Ionian seas. In the Turkish provinces of Scutari, Monastir, and Saloniki, there are a number of large and deep lakes, pre-eminently those of Scutari, Ochrida, Janina, Prespa, and Kastoria. The climate of the peninsula is exceedingly varied; it is rigorous with heavy snowfalls in the north and in the central plateau between Serajevo (Bosnia) and Sofia (Bulgaria), and the tableland of Janina, but becomes mild and sunny toward the south and east, tempered by the breezes of the Ægean. There is hardly any country in the world inhabited by such a number of different peoples as the Balkan Peninsula. Surviving there are all the races recorded at the beginning of history, with their national languages and distinct racial consciousness. They do not form, however, the whole people or even the great majority of their particular race in any one district, but are intermingled and live side

by side, without ever blending together, so that the process of disentangling their various and conflicting aspirations, tendencies, and racial as well as religious distinctions, is well-nigh impossible. In eastern Rumelia (ancient Thrace) and Macedonia, there may be found a Greek, a Bulgarian, a Turkish, an Albanian village side by side. The Greeks or Byzantines, the Daco-Rumanians, who speak a distinctly Romance or neo-Latin language, and proudly derive their origin from the legionaries of Emperor Trajanus stationed in Dacia, yet undoubtedly from Dacian or Thracian mothers,—and the Albanians of Illyrian stock are the most ancient historic races of the Balkans. The Slavs are late-comers by migration and conquest. They became neither Greek nor Roman in speech or customs, political character or national proclivities, but remained distinctive in language and racial characteristics. At periods historically well determined, after the Gothic invaders in those regions had been defeated or absorbed or started on their world-stirring career, after the Turanian Avars had lost their overwhelming power, the Slavic tribes moved in great numbers into central and southeastern Europe. About 630 A.D. the Croats began to occupy the present Croatia, Slavonia, northern Bosnia. In 640 the Servians of the same race and language conquered the Avars and peopled Servia, South Bosnia, Dalmatia, Montenegro, whose inhabitants are pure Serbs in blood and language, only deriving their name from their national hero, Ivo the Black (Tsernoi), who gave the name of Tsernogora (Montenegro) to those desert rocks, a safe retreat to the Servians, after their defeat at Kossovo in 1389 inflicted by the Turks. The ethnic situation of to-day dates from that epoch. The origin of the Bulgarians is not quite clear. They appear to be of Finnish-Ugrian stock, and therefore related to the Turks and the Hungarians, but were Slavized early in history. The great apostles of the Slavs, Methodius and Cyrillus, themselves Bulgarians, even brought Byzantine culture and the Greek-orthodox religion to the other Slavic races on the peninsula. The battle of Kossovo, already mentioned, made an end to the independence of the highly developed Slavic States, and with the fall of Constantinople in 1453, the last bulwark of the crumbling Byzantine empire, the Turkish sway over the entire Balkan Peninsula became a reality. Four centuries of racial strife between the Turkish conquerors and the various Greek, Rumanian, and Slavic races under their sway ended in the formation of the Danube States and the Hellenic kingdom, more or less according to races and nationalities, so far as this was possible at all in the case of peoples which are at least as far removed in sympathy and political aspirations from one another as they are from the Turks. The racial antagonisms are grievously accentuated in the attempted solutions of racial, political, and religious problems. HERMANN SCHOENFELD, *Columbian University, Washington, D. C.*

Balkh, bälkh, a district of Afghan Turkestan. It corresponds to ancient Bactria, and is bounded on the north by the river Oxus, on the east by Badakhshan, on the south by the Hindu Kush, and west by the desert. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between Indian and eastern Europe before the

BALKH — BALLAD

sea route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense and the snow lies deep on the ground. The natives are Uzbeks, whose character differs in different districts.

Balkh, the capital of the district of the same name, situated in a district intersected by canals and ditches. It is surrounded by a mud wall; but though bearing the imposing title of "Mother of Cities," it has not in recent times had any of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur. A terrible outbreak of cholera in 1877 caused the capital of Afghanistan Turkestan to be transferred to Mazar, west of Balkh; since which Balkh has been an insignificant village.

Balkhash, bāl-kash', a great inland lake, near the eastern border of Russian Central Asia. Lying about 780 feet above sea-level, it extends 323 miles west-southwest, its breadth at the west end is 50 miles; at the east from 9 to 4 miles; the area is 8,400 square miles. The water is clear but intensely salt. Its principal feeder is the river Il. It has no outlet. The northern edge is well defined; but the south shores of the lake are labyrinths of islands, peninsulas, low sandhills, and strips of shallow water. Here grow masses of enormously tall reeds in which wild swine shelter. To the south, stretching toward the base of the Ala-tau Mountains, is a vast steppe almost devoid of vegetation. Balkhash seems to have at one time included in its immense area the smaller lakes Sossik-kul and Ala-kul, now far to the southeast.

Bal'kis, the Arabian name of the queen of Sheba who visited Solomon. She is the central figure of innumerable Eastern legends and tales.

Ball, Ephraim, American inventor. b. Greentown, O., 12 Aug 1812; d. Canton, O., 1 Jan. 1872. He was brought up as a carpenter, but in 1840 he established a foundry for making plow castings; invented a plow, a turn-top stove, the Ohio mower, the World mower and reaper, and the New American harvester; and for many years before his death was president of an extensive manufacturing plant at Canton, Ohio.

Ball, John, English priest of the 14th century. He was a disciple of Wycliffe, upon whose religious doctrines he engrafted some political theories resembling the "liberty, equality, and fraternity" of later ages. He was intimately concerned in the Wat Tyler insurrection of 1381, and for his part in the affair was executed at St. Albans, 15 July 1381. See Morris, 'The Dream of John Ball.'

Ball, Sir Robert Stawell, distinguished English astronomer: b. Dublin, 1 July 1840. In 1865 he was appointed Lord Rosse's astronomer at Parsonstown. He has held many posts in connection with astronomy and mathematics, including those of professor of applied mathematics and mechanism at the Royal College of Science for Ireland; Andrews professor of astronomy in the University of Dublin; astrono-

mer-royal of Ireland; and Lowdean professor of astronomy and geometry in the University of Cambridge. The Royal Society elected him a Fellow in 1873, and in 1886 he was knighted. His numerous works include: 'The Story of the Heavens' (1885); 'Time and Tide' (1889); 'Star-Land' (1889); 'The Story of the Sun' (1893); 'Great Astronomers' (1895); 'A Treatise on the Theory of Screws' (1900); 'The Earth's Beginning' (1901).

Ball, Thomas, American sculptor: b. Charlestown, Mass., 3 June 1819. He studied in Italy; engaged in painting, 1840-52; adopted sculpture exclusively in 1851; resided in Florence, Italy, 1865-97; and afterward in Montclair, N. J. His best-known works are the equestrian statue of Washington in Boston; the Webster statue in Central Park, New York; and 'Emancipation' in Washington, D. C. He published 'My Threescore Years and Ten, an Autobiography' (1891).

Ball, as an article of ammunition, see GUNNERY; ORDNANCE; PROJECTILES; SHOT.

As an implement of sport, see BASE-BALL; BASKET-BALL; CRICKET; FOOT-BALL; HAND-BALL; etc.

Ball and Socket, a joint used in machinery and piping. It consists of a spherical end of a rod or pipe fitting into a hollow sphere of the same size on a like piece. The object of this joint is to provide a close, movable connection, and to prevent leakage in pipes.

Ball Bearing, a mechanical bearing, consisting of a cup against the inner circumference of which steel balls are placed. A cone fitted to the steel bears against these balls. It is used to a great extent in bicycles and light carriage wheels, and to a less extent in light machinery and wagon bearings. Its object is to reduce friction and the use of lubricants.

Ball Clay. See CLAY.

Ball Cock, a self-acting stop-cock, opened and shut by means of a hollow metallic sphere attached to the end of a lever connected with the cock. Its use is principally to regulate the supply of water to cisterns. The ball floats by reason of its buoyancy, and rising and sinking as the water rises and sinks, shuts off the water in the one case and lets it on in the other.

Ball Flower, an architectural ornament resembling a ball placed in a circular flower, the three petals of which form a cup around it; usually inserted in a hollow molding, and generally characteristic of the Decorated Gothic style of the 14th century.

Ball Nozzle. See HYDRODYNAMICS.

Ballad, a narrative in lyric form, with no traces of individual authorship, and preserved mainly by oral tradition. In its earliest stages it was meant to be sung by a crowd, and got its name from the dance to which it furnished the sole musical accompaniment. In these primitive communities the ballad was doubtless chanted by the entire folk in festivals mainly of a religious character. Explorers still meet something of the sort in savage tribes; and children's games preserve among us some relics of this protoplasmic form of verse-making, in which the single poet or artist was practically unknown,

BALLAD

and spontaneous, improvised verses arose out of the occasion itself; in which the whole community took part; and in which the beat of foot,—along with the gesture which expressed narrative elements of the song,—was inseparable from the words and the melody. This native growth of song, in which the chorus or refrain, the dance of a festal multitude, and the spontaneous nature of the words, were vital conditions, gradually faded away before the advance of cultivated verse and the vigor of production in what one may call poetry of the schools. Very early in the history of the ballad a demand for more art must have called out or at least emphasized the artist, the poet, who chanted new verses while the throng kept up the refrain or burden. Moreover, as interest was concentrated upon the words or story, people began to feel that both dance and melody were separable if not alien features; and thus they demanded the composed and recited ballad, to the harm and ultimate ruin of that spontaneous song for the festal, dancing crowd. Events of interest were sung in almost contemporary and entirely improvised verse; and the resulting ballads, carried over the borders of their community and passed down from generation to generation, served as newspaper to their own times and as chronicle to posterity. It is the kind of song to which Tacitus bears witness as the sole form of history among the early Germans; and it is evident that such a stock of ballads must have furnished considerable raw material to the epic. Ballads, in whatever original shape, went to the making of the English 'Beowulf,' and of the German 'Nibelungenlied.' Moreover, a study of dramatic poetry leads one back to similar communal origins. What is loosely called a "chorus,"—originally, as the name implies, a dance, out of which older forms of the drama were developed,—could be traced back to identity with primitive forms of the ballad. The purely lyrical ballad, even, the *chanson* of the people, so rare in English but so abundant among other races, is evidently a growth from the same root.

If, now, we assume for this root the name of communal poem, and if we bear in mind the dominant importance of the individual, the artist, in advancing stages of poetry, it is easy to understand why for civilized and lettered communities the ballad has ceased to have any vitality whatever. Under modern conditions the making of ballads is a closed account. For our times poetry means something written by a poet, and not something sung more or less spontaneously by a dancing throng. Indeed, paper and ink, the agents of preservation in the case of ordinary verse, are for ballads the agents of destruction. The broadside press of three centuries ago, while it rescued here and there a genuine ballad, poured out a mass of vulgar imitations which not only displaced and destroyed the ballad of oral tradition, but brought contempt upon good and bad alike. Poetry of the people, to which our ballad belongs, is a thing of the past. Even rude and distant communities, like those of Afghanistan, cannot give us the primitive conditions. The communal ballad is rescued, when rescued at all, by the fragile chances of a written copy or of oral tradition; and we are obliged to study it under terms of artistic poetry,—that is, we are forced, to take through the eye and the

judgment what was meant for the ear and immediate sensation. Poetry for the people, however,—“popular poetry” in the modern phrase,—is a very different affair. Street songs, vulgar rhymes, or even improvisations of the concert-halls, tawdry and sentimental stuff—these things are sundered by the world's width from poetry of the people, from the folk in verse, whether it echo in a great epos which chants the clash of empires or linger in a ballad of the countryside sung under the village linden. For this ballad is a part of the poetry which comes from the people as a whole, from a homogeneous folk, large or small; while the song of street or concert-hall is deliberately composed for a class, a section, of the community. It would, therefore, be better to use some other term than “popular” when we wish to specify the ballad of tradition, and so avoid all taint of vulgarity and the trivial. Nor must we go to the other extreme. Those high-born people who figure in traditional ballads.—Childe Waters, Lady Maisry, and the rest,—do not require us to assume composition in aristocratic circles; for the lower classes of the people in ballad days had no separate literature, and a ballad of the folk belonged to the community as a whole. The same habit of thought, the same standard of action, ruled alike the noble and his meanest retainer. Oral transmission, the test of the ballad, is of course nowhere possible save in such an unlettered community. Since all critics are at one in regard to this homogeneous character of the folk with whom and out of whom these songs had their birth, one is justified in removing all doubt from the phrase by speaking, not of the popular ballad, but of the communal ballad—the ballad of a community.

With regard to the making of a ballad, one must repeat a caution hinted already, and made doubly important by a vicious tendency in the study of all phases of culture. It is a vital mistake to explain primitive conditions by exact analogy with conditions of modern savagery and barbarism. Certain conclusions, always guarded and cautious to a degree, may indeed be drawn; but it is folly to insist that what now goes on among shunted races, belated detachments in the great march of culture, must have gone on among the dominant and mounting peoples who had reached the same external conditions of life. The homogeneous and unlettered state of the ballad-makers is not to be put on a level with the ignorance of barbarism, nor explained by the analogy of songs among modern savage tribes. Fortunately we have better material. The making of a ballad by a community can be illustrated from a case recorded by Pastor Lyngbye in his invaluable account of life on the Faroe Islands a century ago. Not only had the islanders used from most ancient times their traditional and narrative songs as music for the dance, but they had also maintained the old fashion of making a ballad. In the winter, says Lyngbye, dancing is their chief amusement and is an affair of the entire community. At such a dance, one or more persons begin to sing; then all who are present join in the ballad, or at least in the refrain. As they dance, they show by their gestures and expression that they follow with eagerness the course of the story which they are singing. More than this, the ballad is often

BALLAD

a spontaneous product of the occasion. A fisherman who has had some recent mishap with his boat is pushed by stalwart comrades into the middle of the throng, while the dancers sing verses about him and his lack of skill—verses improvised on the spot and with a catching and clamorous refrain. If these verses win favor, says Lyngbye, they are repeated from year to year, with slight additions or corrections and become a permanent ballad. Bearing in mind the extraordinary readiness to improvise shown even in these days by peasants in every part of Europe, we thus gain some definite notion about the spontaneous and communal elements which went to the making of the best type of primitive verse; for these Faroe islanders were no savages, but simply a homogeneous and isolated folk which still held to the old ways of communal song.

Critics of the ballad, moreover, agree that it has little or no subjective traits—an easy inference from the conditions just described. There is no individuality lurking behind the words of the ballad, and, above all, no evidence of that individuality in the form of sentiment. Sentiment and individuality are the very essence of modern poetry and the direct result of individualism in verse. Given a poet, sentiment,—and it may be noble and precious enough,—is sure to follow. But the ballad, an epic in little, forces one's attention to the object, the scene, the story, and away from the maker.

"The king sits in Dumferling town,"

begins one of the noblest of all ballads; while one of the greatest of modern poems opens with something personal and pathetic, keynote to all that follows:

"My heart aches, and a drowsy numbness pains
My sense."

Even when a great poet essays the ballad, he either puts sentiment into it, or he keeps sentiment out of it by a *tour de force*. Admirable and noble as one must call the conclusion of an artistic ballad such as Tennyson's 'Revenge,' it is altogether different from the conclusion of such a communal ballad as 'Sir Patrick Spens.' That subtle quality of the ballad which lies in solution with the story, and which,—as in 'Child Maurice,' or 'Babylon,' or 'Edward,'—compels in us sensations akin to those called out by the sentiment of the poet, is a wholly impersonal if strangely effective quality, far removed from the corresponding elements of the poem of art. At first sight one might say that Browning's dramatic lyrics had this impersonal quality. But compare the close of 'Give a Rouse,' chorus and all, with the close of 'Child Maurice,' that swift and relentless stroke of pure tragedy which called out the enthusiasm of so great a critic as Gray.

The narrative of the communal ballad is full of leaps and omissions; the style is simple to a fault; the diction is spontaneous and free. Assonance frequently takes the place of rhyme, and a word often rhymes with itself. There is a lack of poetic adornment in the style quite as conspicuous as the lack of reflection and moralizing in the matter. Metaphor and simile are rare, and, when found, are for the most part standing phrases common to all the ballads; there is never poetry for poetry's sake. Iteration is the chief mark of ballad style; and

the favorite form of this effective figure is what one may call incremental repetition. The question is repeated with the answer; each increment in a series of related facts has a stanza for itself, identical, save for the new fact, with the other stanzas. 'Babylon' furnishes good instances of this progressive iteration. Moreover the ballad differs from earlier English epics in that it invariably has stanzas and rhyme; of the two forms of stanza, the two-line stanza with a refrain is probably older than the stanza with four or six lines.

This necessary quality of the stanza points to the origin of the ballad in song; but longer ballads, such as those that make up the 'Gest of Robin Hood,' an epic in little, were not sung as lyrics or to aid the dance, but were either chanted in a monotonous fashion or else recited outright. Chappell, in his admirable work on old English music ('Music of the Olden time,' ii. 790), names a third class of "characteristic airs of England"—the "historical and very long ballads, . . . invariably of simple construction, usually plaintive. . . . They were rarely if ever used for dancing." Most of the longer ballads, however, were doubtless given by one person in a sort of recitative; this is the case with modern ballads of Russia and Servia, where the bystanders now and then join in a chorus. Precisely in the same way ballads were divorced from the dance, originally their vital condition; but in the refrain, which is attached to so many ballads, one finds an element which has survived from those earliest days of communal song.

Of the oldest communal poetry no actual ballad has come down to us. Hints and even fragments, however, are pointed out in ancient records, mainly as the material of chronicle or legend. In the Bible (Num xxi. 17), where "Israel sang this song," we are not going too far when we regard the fragment as part of a communal ballad. "Spring up, O well: sing ye unto it: the princes digged the well, the nobles of the people digged it, by the direction of the lawgiver, with their staves." Deborah's song has something of the communal note; and when Miriam dances and sings with her maidens one is reminded of the many ballads made by dancing and singing bands of women in mediæval Europe—for instance, the song made in the 7th century to the honor of St. Faro, and "sung by the women as they danced and clapped their hands." The question of ancient Greek ballads, and their relation to the epic, is not to be discussed here; nor can we make more than an allusion to the theory of Niebuhr that the early part of Livy is founded on old Roman ballads. A popular discussion of this matter may be found in Macaulay's preface to his own 'Lays of Ancient Rome.' The ballads of modern Europe are a survival of older communal poetry, more or less influenced by artistic and individual conditions of authorship, but wholly impersonal, and with an appeal to our interest which seems to come from a throng and not from the solitary poet. Attention was early called to the ballads of Spain; printed at first as broadsides, they were gathered into a volume as early as 1550. On the other hand, ballads were neglected in France until very recent times; for specimens of the French ballad, and for an account of it, the reader should consult Prof. Crane's 'Chansons Populaires de

BALLADE — BALLANTINE

France' (N. Y. 1891). It is with ballads of the Germanic race, however, that we are now concerned. Denmark, Norway, Sweden, Iceland, the Faroe Islands, Scotland and England, the Netherlands and Germany—all these countries offer us admirable specimens of the ballad. Particularly, the great collections of Grundtvig ('Danmarks Gamle Folkeviser') for Denmark, and of Child ('The English and Scottish Popular Ballads') for our own tongue, show how common descent or borrowing connects the individual ballads of these groups. "Almost every Norwegian, Swedish, or Icelandic ballad," says Grundtvig, "is found in a Danish version of Scandinavian ballads; moreover a larger number can be found in English and Scottish versions than in German or Dutch versions." Again, we find certain national preferences in the character of the ballads which have come down to us. Scandinavia kept the old heroic lays (*kæmpeviser*); Germany wove them into her epic, as witness the Nibelungen Lay; but England and Scotland have none of them in any shape. So, too, the mythic ballad, scantily represented in English, and practically unknown in Germany, abounds in Scandinavian collections. The Faroe Islands and Norway, as Grundtvig tells us, show the best record for ballads preserved by oral tradition; while noble ladies of Denmark, three or four centuries ago, did high service to ballad literature by making collections in manuscript of the songs current then in the castle as in the cottage.

For England one is compelled to begin the list of known ballads with the 13th century. 'The Battle of Maldon,' composed in the last decade of the 10th century, though spirited enough and full of communal vigor, has no stanzaic structure, follows in metre and style the rules of the Old English epic, and is only a ballad by courtesy; about the ballads used a century or two later by historians of England we can do nothing but guess; and there is no firm ground under the critic's foot until he comes to the Robin Hood ballads, which Prof. Child assigns to the 13th century. 'The Battle of Otterburn' (1388) opens a series of ballads based on actual events and stretching into the 18th century. Barring the Robin Hood cycle,—an epic constructed from this attractive material lies before us in the famous 'Gest of Robin Hood,' printed as early as 1489,—the chief sources of the collector are the Percy Manuscript, "written just before 1650,—on which, not without omissions and additions, the bishop based his 'Reliques,' first published in 1765,—and the oral traditions of Scotland, which Prof. Child refers to 'the last 130 years.' Information about the individual ballads, their sources, history, literary connections, and above all, their varying texts, must be sought in the noble work of Prof. F. J. Child. For present purposes a word or two of general information must suffice. As to origins there is a wide range. The Church furnished its legend, as in 'St. Stephen'; romance contributed the story of 'Thomas Rymmer'; and the light, even cynical *fabliau* is responsible for 'The Boy and the Mantle.' Ballads which occur in many tongues may either have a common origin or owe their manifold versions, as in the case of popular tales, to a love of borrowing; and here, of course, we get the hint of wider issues. For the most part, however, a ballad tells some

moving story, preferably of fighting and of love. Tragedy is the dominant note; and English ballads of the best type deal with those elements of domestic disaster so familiar in the great dramas of literature, in the story of Orestes, or of Hamlet, or of the Cid. Such are 'Edward,' 'Lord Randal,' 'The Two Brothers,' 'The Two Sisters,' 'Child Maurice,' 'Bewick and Graham,' 'Clerk Colven,' 'Little Musgrave and Lady Barnard,' 'Glasgerion,' and many others. Another group of ballads, represented by the 'Baron of Brackley' and 'Captain Car,' give a faithful picture of the feuds and ceaseless warfare in Scotland and on the border. A few fine ballads,—'Sweet William's Ghost,' 'The Wife of Usher's Well,'—touch upon the supernatural. Of the romantic ballads, 'Childe Waters' shows us the higher, and 'Young Beichan' the lower, but still sound and communal type. Incipient dramatic tendencies mark 'Edward' and 'Lord Randal'; while, on the other hand, a lyric note almost carries 'Bonnie George Campbell' out of balladry. Finally it is to be noted that in 'The Nut-Brown Maid,' which many would unhesitatingly refer to this class of poetry, we have no ballad at all, but a dramatic lyric, probably written by a woman, and with a special plea in the background.

Bibliography.—Bonning, 'Servian Popular Poetry' (1827); Child, 'English and Scottish Popular Ballads' (1883-98); Gummere, 'Old English Ballads' (1894); Marin, 'Cantos Populares Españoles' (1882-3); Upland, 'Alte hoch-und niederdeutsche Volkslieder' (1892).

Ballade, ba-lad', the earlier and modern French spelling of "ballad," but now limited in its use to a distinct verse-form introduced into English literature of late years from the French and chiefly used by writers of *vers de société*. It consists of three stanzas of eight lines each, with an "envoy" or closing stanza of four lines. The rhymes, which are not more than three, follow each other in the stanzas, thus: a, b, a, b; b, c, b, c, and in the envoy, b, c, b, c; and the same line serves as a refrain to each of the stanzas and to the envoy. There are other varieties, but this may be regarded as the strictest, according to the precedent of Villon and Marot.

Ballanche, ba-lansh', **Pierre Simon**, French philosopher: b. Lyons, 4 Aug. 1776; d. 12 June 1847. His great work is the 'Palin-génésie Sociale' (1828), in which he seeks to illustrate the workings of God in history and sketch how human society may and will be reconstructed so as to attain its highest development. His works are a strange mixture of mysticism, socialism, and the philosophy of history. His 'Vision d'Hébal' (1832) is a prophetic forecast of the world's history, Hébal being a second-sighted chief of a Scottish clan.

Bal'lantine, James, Scottish artist and poet: b. Edinburgh, 11 June 1808; d. 18 Dec. 1877. He was brought up as a house-painter, but afterward learned drawing under Sir William Allen and was one of the first to revive the art of glass-painting. He was commissioned to execute the stained-glass windows for the House of Lords, and in 1845 published a treatise on glass-staining, which was translated into German. Two prose volumes, 'The Gaberlunzie's Wallet' (1843), and 'The Miller of Deanhaugh' (1845), contain some of his best-known songs and ballads. He was author of 'Poems'

BALLANTINE — BALLESTEROS

(1856 and 1865); 'One Hundred Songs with Music' (1865); 'Life of David Roberts, R. A.' (1866); and 'Lilias Lee' (1871).

Ballantine, William Gay, American educator: b. Washington, D. C., 7 Dec. 1848. He was graduated at Marietta College 1868, and at the Union Theological Seminary 1872; spent a year in study in Leipsic; was attached to the American Palestine Exploring Expedition of 1873; professor of chemistry and natural science in Ripon College 1874-6; professor of Greek and Hebrew in the University of Indiana 1878-81; professor of Old Testament language and literature at Oberlin Theological Seminary 1881-91; and president of Oberlin College 1891-6. Dr. Ballantine was one of the editors of the 'Bibliotheca Sacra' (1884-91).

Bal'lantyne, James, Scottish printer: b. Kelso, 1772; d. Edinburgh, 1833. Successively a solicitor and a printer in his native town, at the suggestion of Sir Walter Scott he removed to Edinburgh, where the high perfection to which he had brought the art of printing, and his connection with Scott, whose works he printed, secured him a large trade. The firm of James Bal'lantyne & Company included Scott, James Bal'lantyne, and his brother John (who died in 1821). For many years he conducted the *Edinburgh Weekly Journal*. His firm was involved in the bankruptcy of Constable & Company, by which Scott's fortunes were wrecked, but Bal'lantyne was continued by the creditors' trustee in the literary management of the printing-house. He survived Scott only about four months.

Ballantyne, James Robert, Scottish Orientalist: b. Kelso, Scotland, 1813; d. 1864. After receiving an education at Haileybury College he was sent to India, where he was placed in charge of the Sanskrit College at Benares. On his return to England he was made librarian of the East India office. Among his writings are 'The Practical Oriental Interpreter' (1843); 'Catechism of Sanskrit Grammar'; 'Synopsis of Science in Sanskrit and English, reconciled with the Truths to be found in the Nyaya Philosophy' (1856); 'Christianity Contrasted with Hindu Philosophy' (1859).

Ballantyne, Robert Michael, Scotch writer: b. Edinburgh, 1825; d. Rome, Italy, 8 Feb. 1894. He spent his youth in Canada in the service of the Hudson Bay Company, but in 1856 adopted literature as a profession. He became very popular in England as a writer of stories for boys. Among the best known are 'Deep Down,' 'The Coral Island,' 'The World of Ice,' 'Un-gava,' 'The Dog Crusoe,' and others.

Ballarat', or Ballaarat, an Australian town in the colony of Victoria, the chief centre of the gold-mining industry of the colony, and the place next in importance to Melbourne, from which it is distant west-northwest 74 miles by rail. It owes its present importance and prosperity to its being the centre of one of the richest gold-yielding districts of the world. It consists of two distinct municipalities, Ballarat West and Ballarat East, which are separated by Yarrowee Creek. The town is well lighted with gas, abundantly supplied with water, and contains many handsome public edifices, among which may be mentioned the city hall, council-chamber, two town halls, a spacious hospital, an orphan asylum, a benevolent asylum, a lying-

in hospital and refuge, public baths, a jail, mechanics' institute (with 22,500 volumes), a free library (with 15,000 volumes), a theatre, and several other places of amusement, post-office, extensive railway premises, forty churches, two cathedrals, the palaces of the Anglican and Roman Catholic bishops, two colleges, four grammar and various other schools, a school of mines, many banks, numerous fine hotels, etc. There are several iron-foundries, breweries and distilleries, flour-mills, woolen-mills, and other factories. Gold was first discovered at Ballarat in June 1851, and the extraordinary richness of the field soon attracted hosts of miners. When the surface diggings became exhausted it was discovered that richer deposits of the precious metal lay at greater depths, and now there are mines as deep as some coal-pits. They are worked by steam-pumping and other machinery, and give employment to over 6,000 men, about 1,000 of whom are Chinese. One of the largest nuggets ever found anywhere was discovered here, and was sold for \$52,000. The surrounding district is also eminently suitable for farming and sheep-breeding. In addition to the line to Melbourne, Ballarat has railway connection with Geelong, Ararat, Maryborough, Castlemaine, etc. Pop. (1897) 46,137.

Ballast. (1) Heavy matter, as stone, sand, iron, or water placed in the bottom of a ship or other vessel, to sink it in the water to such a depth as to enable it to carry sufficient sail without oversetting. (2) The sand placed in bags in the car of a balloon to steady it and to enable the aeronaut to lighten the balloon by throwing part of it out. (3) The material used to fill up the space between the rails on a railway in order to make it firm and solid.

Bal'lentyne, or Bal'lenden, John, Scottish poet, and translator of Boece's 'Latin History,' and of the first five books of Livy into the vernacular language of his time: b. Lothian toward the close of the 15th century; said to have died at Rome, 1550. He was in the service of James V. from the king's earliest years, and at his request he translated Boece's 'History,' which had been published at Paris in 1526, the translation being printed in 1536. As a reward he was made archdeacon of Moray and a canon of Ross. He was a bitter opponent of the Reformation.

Balleny (bál'lā'ne) Islands, a group of five small volcanic islands, discovered in the Antarctic Ocean in 1839, nearly on the Antarctic Circle, and in lon. 164° E. One contains a very lofty mountain.

Ballerini, bál-lér-ē'nē. See CASUISTRY.

Ballesteros, bál-yēs-tā'rōs, Francisco, Spanish general: b. Saragossa, 1770; d. Paris, 22 June 1832. He first served in Catalonia against the French during the campaigns of 1792 and 1795, and was appointed to a captaincy. Discharged in 1804 on account of embezzlement, he was nevertheless entrusted by the all-powerful Godoy, "prince of the peace," with one of the most productive offices in the custom-house, the direction of the *resguardo* at Oviedo. When the French army invaded Spain in 1808, Ballesteros was promoted to a colonelcy by the provincial junta of Asturia, and joined the Castilian army under Castaños and Black. The regency of Cadiz promoted him to the rank of lieutenant-general and put him in command of the army of

BALLESTREM — BALLISTIC GALVANOMETER

Andalusia. He had then to fight against some of the most skilful chiefs of the French army, and succeeded in avoiding their pursuit by peculiar tactics. When Wellington was entrusted in 1812 with the general command of all the armies in the Peninsula, Ballesteros showed such violent opposition that he was arrested as guilty of treason and sent as a prisoner to Ceuta. A few months later he was restored to liberty, but was not allowed to re-enter the military service. On the return of Ferdinand VII to Spain Ballesteros made such a show of devotion to monarchical principles that he was appointed secretary of war, but was soon dismissed and sent to Valladolid, where he was placed under the strictest surveillance. When the struggle between the royalists and the constitutionalists commenced, he managed so artfully that each party thought Ballesteros was acting in concert with them. Commissioned by the chiefs of the latter to obtain the assent of the king to the constitution, he succeeded beyond their anticipations and became a member of the council of state, while he was at the same time admitted in the *comuneros* association. This double-dealing seemed to be perfectly successful, for in 1823, on the entry of the French into Spain he was appointed to the command of the army; but instead of showing fight he concluded a capitulation with the Duke of Angoulême, which became the occasion of accusations of such a character that Ballesteros thought it imprudent to stay any longer in his own country, and took refuge in France, where he died a forgotten exile.

Ballestrem, bal'lês-strâm, **Franz Xaver, Count von**, German statesman: b. Plawno-witz, in Upper Silesia, 1834. Entering the Prussian army he served during the Austro-Prussian campaign of 1866 and the Franco-Prussian war of 1870-1. At the close of the latter he was elected to the Reichstag, where he soon became prominent in the Centre party. Pius IX appointed him a papal chamberlain for his activity in the Culturkampf, and he was first vice-president of the lower House, 1890-3.

Ballet, bāl'lā, or bāl'lēt, (from *bal*; from the French *baller*, and the Italian *ballare*, to dance), a kind of dance now usually constituting an interlude in a theatrical performance. In its widest sense a ballet is the representation of a series of passionate actions and feelings by means of gestures and dancing. In a more confined sense we call ballets musical pieces, the object of which is to represent by mimic movements and dances, actions, characters, sentiments, passions, and feelings, in which several dancers perform together. According to the analogy of lyrical poetry those which rather represent feelings may be called lyrical ballets; those which imitate actions, dramatic ballets. The lyrical and dramatic ballets, together, constitute the higher art of dancing, in opposition to the lower, the aim of which is only social pleasure. Dramatic ballets are classed as historical, the subject of which is a real event; mythological, in which the subject is some fabulous action; and poetical, founded on poetical fiction, to which belong also the allegorical, necessarily the most imperfect. A ballet is usually divided into several acts, each of which has several *entrées*. An *entrée*, in a ballet, consists of one or several quadrilles of dancers,

who, by their steps, gestures, and attitudes, represent a certain part of the action. In criticising a ballet we must consider, first, the choice of the subject, which must have unity of action or of passion, and be capable of being represented in an intelligible manner by means of mimic movements and dancing; secondly, the plan and execution of the single parts, which must have due proportion to each other; and, finally, the music and decorations, which must supply whatever dancing cannot bring before the eye. The ballet is an invention of modern times. Baltazarini, director of music to Catherine de' Medici, probably gave its form to the regular ballet, though pantomimic dances were not unknown to the ancients. The ballet owes much to the French, and particularly to Noverre.

Balliet, Thomas M., American educator: b. 1 March 1852. He was educated at Franklin and Marshal College (Lancaster, Pa.) and at Yale, was appointed superintendent of public schools in Springfield, Mass., and also became associate editor of the 'Pedagogical Seminary'. His writings include 'Some New Phases of Educational Thought'.

Balliol (bāl'yol) **College**, Oxford, an important college founded between 1263 and 1268 by John Balliol (q.v.). The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8d. per week for each. From 1340 to 1830 the college was greatly enriched by various benefactions. The society consists of a master, 13 fellows, and 24 scholars. The number of members on the books is about 600. The master and fellows enjoy the privilege of electing their own visitor. John Wyclif was master of this college in 1361; among its scholars have been John Evelyn, Bradley the astronomer, Mathew Arnold Swinburne, and the late Archbishop Temple. The Snell exhibitions for students of Glasgow University attract annually to this college a few distinguished Scottish students.

Ballis'tic Galvano'meter, a galvanometer (q.v.) designed or used for the measurement of electric currents of very short duration. It does not necessarily differ in any essential particular from other galvanometers, except that the natural period of oscillation of its needle must be long in comparison with the duration of the transient currents that are to be measured. If C is the intensity of the current that is to be measured, and t is the time during which it passes, the general theory of the instrument is as follows: The magnetic moment tending to deflect the needle is proportional to C , and the angular velocity that such a magnetic moment can produce when acting upon a freely suspended body like the needle is proportional to t . Hence the angular velocity actually communicated to the needle is proportional both to C and to t ; or, in other words, it is proportional to the product Ct . But an electric "current" (such as is here denoted by C) is defined as the quantity of electricity passing per second; and hence Ct is the quantity of electricity passing in the time t . The angular velocity actually communicated to the needle (which is inferred by observing the extent of the swing) is therefore proportional to the total quantity of electricity passed through the galvanometer during the short time t , and not to

BALLISTICS — BALLOON

the intensity of the current. This constitutes the chief peculiarity of the instrument. The ballistic galvanometer measures the total quantity of electricity passed through the instrument, and its readings are in coulombs; while other galvanometers measure the intensity of the current passing, and their readings are in amperes. If the needle of the instrument moves sensibly during the passage of the current, the magnetic movement exerted upon the needle will also vary, even though the current itself remains constant. It is for this reason that the period of free swing of the needle must be long if the instrument is to be used ballistically.

Ballis'tics. See ORDNANCE.

Bal'listite. See EXPLOSIVES.

Balloon', a bag-like receptacle filled with hydrogen, coal-gas, or other light gaseous matter, and designed to rise in the air. The first balloon was constructed by Stephen and Joseph Montgolfier, sons of Peter Montgolfier, a well-known paper-maker of Annonay, France. Observing the suspension of clouds in the air, they conceived the idea of filling a light bag with some substance of a cloud-like nature, and trying it to see if it would not ascend. After experimenting on a small scale with paper bags filled with smoke, they constructed a linen bag about 30 feet in diameter and inflated it with hot air from a fire fed with chopped straw. The attempt was entirely successful, and on 5 June 1783, the balloon rose to a height of about a mile and a half in the presence of a considerable number of amazed spectators.

As might be expected, an experiment of so novel a nature attracted a great deal of attention, and only two months later a balloon was constructed on more scientific principles by M. Charles, of Paris. The bag used by M. Charles was made of thin varnished silk, and inflated with hydrogen gas generated by the action of sulphuric acid upon iron filings. Some difficulty was found in filling the bag satisfactorily, but the task was completed at the end of four days, and on 27 Aug. 1783, the balloon rose from the Champ de Mars to a height of 3,000 feet, remaining in the air for about three quarters of an hour and eventually falling in a field about 15 miles away, where it was torn to shreds by terrified peasants. The excitement in Paris was very great, and plans were laid to build balloons large enough to sustain human beings. After several trials with a captive balloon of the hot-air or Montgolfier type, M. François Pilâtre de Rozier, satisfied that there would be no difficulty in maintaining a fire under the balloon while in the air, made an ascension from the Bois de Boulogne on 21 Nov. 1783, accompanied by the Marquis d'Arlandes. They remained in the air about 25 minutes, during which time they rose to a height of 500 feet and traversed a horizontal distance of over five miles. Ten days later, on 1 Dec. 1783, MM. Charles and Robert made a similar ascension in a balloon filled with hydrogen. They rose to a height of 2,000 feet, and returned to the earth, after about two hours, at Nesle, about 27 miles from their starting-point at Paris. M. Robert then left the car, and M. Charles made a second ascent alone. Owing to an error in the amount of ballast taken in to compensate for the weight of M. Robert, the balloon, when freed, rose rapidly to a height of

about two miles, but no accident resulted, and M. Charles returned to the earth safely.

One of the most famous balloon ascents was that made by Glaisher and Coxwell on 5 Sept. 1862, its avowed object being to ascend to as great a height as possible. The balloon left the ground at 1.03 P.M. and at 1.49 it had attained an altitude of no less than five miles. The temperature then observed was 2° F., the temperature at the earth's surface being 59° F. Mr. Glaisher's own account is as follows:

Up to this time I had taken observations with comfort. I had experienced no difficulty in breathing, while Mr. Coxwell, in consequence of the necessary exertions he had to make, had breathed with difficulty for some time. At 1.51 the barometer reading was 10.80 inches. . . . I could not see the column of mercury in the wet-bulb thermometer; nor afterward the hands of the watch, nor the fine divisions on any instrument. I asked Mr. Coxwell to help me read the instruments, as I experienced a difficulty in seeing. In consequence, however, of the rotatory motion of the balloon, which had continued without ceasing since the earth had been left, the valve-line had become twisted, and he had to leave the car and mount into the ring above to adjust it. At this time I looked at the barometer and found it to read 9.94 inches, implying a height of 29,000 feet, and it was still falling fast. Shortly afterward I laid my arm upon the table, possessed of its full vigor, and on being desirous of using it I found it powerless. I tried to move the other arm and found it powerless also. I then tried to shake myself and succeeded in shaking my body. I seemd to have no limbs. I then looked at the barometer, and while doing so my head fell on my left shoulder. I struggled and shook my body again, but could not move my arms. I got my head upright, but for an instant only, when it fell on my right shoulder, and then I fell backward, my back resting against the back of the car, and my head on its edge; in this position my eyes were directed toward Mr. Coxwell in the ring. When I shook my body I seemed to have full power over the muscles of the back, and considerable power over those of the neck, but none over either my arms or my legs, in fact, I seemed to have no arms or legs. As in the case of the arms, all muscular power was lost in an instant from my back and neck. I dimly saw Mr. Coxwell in the ring, and endeavored to speak, but could not; and in another instant intense black darkness came; the optic nerve finally lost power suddenly. I was still conscious, with as active a brain as at the present moment while writing this. I thought I had been seized with asphyxia, and that I should experience no more, as death would come unless we speedily descended; other thoughts were actively entering my mind when I suddenly became unconscious as on going to sleep. I cannot tell anything of the sense of hearing; the perfect stillness and silence of the regions six miles from the earth (and at this time we were between six and seven miles high) is such that no sound reaches the ear. My last observations were made at 1.54, at 29,000 feet. I suppose two or three minutes, fully, were occupied between my eyes becoming insensible to seeing fine divisions and 1.54, and then that two or three minutes more passed till I was insensible; therefore I think this took place at about 1.56 or 1.57. While powerless, I heard the words "temperature" and "observation," and I knew Mr. Coxwell was in the car speaking to me and endeavoring to arouse me, therefore consciousness and hearing had returned. I then heard him speak more emphatically, but I could not see, speak, or move. I heard him again say, "Do try—now do." Then I saw the instruments dimly, then Mr. Coxwell; and very shortly I saw clearly. I rose in my seat and looked around, as though waking from sleep but not refreshed by sleep, and said to Mr. Coxwell, "I have been insensible." He said, "You have; and I too, very nearly." I then drew up my legs, which had been extended before me, and took a pencil in my hands to begin observations. Mr. Coxwell told me that he had lost the use of his hands, which were black, and I poured brandy over them. I resumed my observations at 2.07, recording the barometer reading at 11.28 inches and temperature—2° F. I supposed that three or four minutes were occupied from the time of my hearing the words "temperature" and "observation" till I began to observe. If so, then returning consciousness came at 2.04, and this gives seven minutes for total insensibility. Mr. Coxwell told me that while in the ring he felt it piercingly cold; that hoar frost was all around the neck of the balloon; that on attempting to leave the ring he found his hands frozen, so that he had to place his arms on the ring

BALLOON

and drop down; that he thought for a moment I had lain back to rest myself; that he spoke to me without eliciting a reply; that he then noticed my legs projected and my arms hung down by my side; that my countenance was serene and placid, without the earnestness and anxiety he had noticed before going into the ring, and then it struck him I was insensible. He wished to approach me, but could not, and he felt insensibility coming over himself; that he became anxious to open the valve, but in consequence of his having lost the use of his hands he could not, and ultimately did so by seizing the cord with his teeth and dipping his head two or three times until the balloon took a decided turn downward. No inconvenience followed this insensibility, and when we dropped it was in a country where no conveyance of any kind could be obtained, so that I had to walk between seven and eight miles. The descent was at first very rapid; we passed downward three miles in nine minutes; the balloon's career was then checked, and it finally descended in the centre of a large grass field at Cold Weston.

Another extremely high ascension was made on 4 Dec. 1894, by Prof. Berson, from Berlin, Germany. His last reading showed a barometric height of 912 inches, and a temperature of -54° F. The temperature at the surface of the earth was 37° F., and the barometric height 30.02 inches. The calculated height attained was 28,750 feet.

The balloon, strictly speaking, is not a flying-machine, nor is it ordinarily under control, so far as its horizontal direction is concerned. It moves with the wind, and (to the aeronaut) is in a calm at all times. The first step in advance of the drifting balloon is to be found in one fitted with some form of propelling machinery, by which the movement is controlled and the balloon navigated and made to move to a certain extent independently of the direction and velocity of the wind. The difficulties lying in the way of a satisfactory solution of the problem of controlling the motion of a balloon are very great. The bulk of the balloon is necessarily vast, and a correspondingly large area is exposed to the action of the wind. Also, the motor that is used must combine great power with extreme lightness.

In working this problem out, France has maintained the lead that her early experiments gave her. A regular balloon corps is attached to the army, both in France and in Germany; and for many years special attention has been directed to the design and construction of dirigible balloons. The details of the mechanisms employed, as well as of the exact contour of the gas envelope, are guarded as military secrets, but enough is known about them to give a general idea of what has been done. Attention was first publicly directed to the success attained with the dirigible balloons of the French army in 1893, by an article in the *Mémoires de la Société des Ingénieurs Civils*. The true progenitor of the dirigible balloon was Gen. Meusnier, who, in a series of papers published in 1783, set forth a scheme for a balloon of this sort. It was not until 1852, however, that Henri Giffard made a rational attempt to construct one. His balloon was spindle-shaped and measured about 144 feet from point to point. His motor was, however, too weak to permit of making any headway against even a moderate breeze, though the balloon could be steered and made to describe circles while drifting. His general form of envelope-construction has been followed by all experimenters since that time.

In 1870 M. Dupuy de Lôme undertook the task of constructing a dirigible balloon. The propeller used was two-armed, 19 feet 8 inches

in diameter and was turned by eight men. The spindle shape was used for the envelope. A trial was made at Vincennes in 1872, where in a breeze of 39 feet per second a deviation of 12° was obtained. The stability was perfect despite the exertions of the eight men at the crab; still the balloon was a drifting one, and was dirigible only in the sense that it could be made to deviate to a slight extent from the true course of the wind. To an outside observer the problem seemed as far from solution as ever; but when taking into consideration the insufficiency of the motor, the committee appointed to be present at the trial said: "It serves as a starting-point for all who wish to continue in this direction."

Others have endeavored to continue the improvement, and the first to achieve results that even approached success was M. Gaston Tissandier, who, with his brother Albert, in 1884, constructed a balloon that was fitted with a Siemens motor driven by a bichromate of soda battery, very ingeniously arranged so as to minimize the weight and at the same time produce the greatest possible effect. The motor weighed 121 pounds and the cells weighed 496 pounds, and contained liquid enough to work for $2\frac{1}{2}$ hours, generating during that interval $1\frac{1}{2}$ horse-power. The screw had two arms and was a little over nine feet in diameter. Several ascensions were made with this balloon. In one, undertaken in 1884, the motor developed $1\frac{1}{2}$ horse-power and was sufficient to propel the structure through the air at a rate of 13 feet per second. After having practically followed the direction of the wind, which had a velocity of about 10 feet per second, during which the rudder turned it aside a little, the balloon was made to describe a semi-circle, and brought up with its head into the wind, where it was navigated for about 10 minutes directly above Grenelle, and the same evolution was repeated above the observatory. Through the exhaustion of the battery it became impossible to return to Paris. These experiments were quickly followed by the work of Commandant Renard of the French balloon corps. With a spindle-shaped balloon, but with a more powerful motor, and the screw placed at the front instead of at the rear, he succeeded in making several ascents and returning to the point of departure. The motor developed 8.5 horse-power, with a weight of 220.5 pounds. In an ascension made on 23 Sept. 1885, the balloon started from Chalais-Meudon against the wind, and went to Paris, where it was easily handled, afterward returning to Chalais.

This work has been continued by the French balloon corps until now the army is possessed of a dirigible balloon that may be considered controllable in light airs. The problem has not been left solely to the military departments of the several nations of the earth for solution, however, for private investigators have been constantly at work upon it. In 1901 a young Brazilian named Santos Dumont made a series of brilliant experiments in France, constructing several balloons, one after another, each being an improvement on its predecessor. In striving for a prize of \$20,000 offered by M. Deutsch for the first dirigible balloon that should start from the Parc d'Aérostation at St. Cloud and be sailed around the Eiffel Tower in Paris and brought back to

BALLOON VINE; BALLOT

the starting-point in thirty minutes, Santos Dumont succeeded in covering the ground in but 40 seconds above the stipulated time. The total distance is a little less than nine miles. This balloon (his sixth) had a length of 108 feet and a diameter of 19 feet 6 inches, and was driven by a 4-cylinder petroleum motor weighing 216 pounds and developing 20 horse-power. The screw was a little more than 13 feet in diameter, and was turned at a speed of 300 revolutions per minute. Instead of the old-fashioned network, the basket and machinery were suspended directly from the envelope by strong piano wire. Japanese silk was used for the envelope itself, and was made impervious to the gas by four coats of linseed oil. See also AERIAL LOCOMOTION; FLYING-MACHINE.

Balloon Vine (*Cardiospermum Helicacabum*), a tropical American and East Indian climbing annual herb of the natural order *Sapindaceæ*, with racemes of small white flowers followed by bladder-like seed-vessels from which the plant is named. It is a general favorite of easy garden culture.

Ballot ("little ball"): essentially, a secret as distinguished from an open vote, to secure the voter from previous intimidation or subsequent revenge. Recent methods of ballot-reform, therefore, are only devices to obtain the result inherent in its very nature, a non-secret ballot being a contradiction in terms and the same as *viva voce* voting. The various forms of ballot reduce to two in essence: ballots themselves indicating choice,—as colored balls, printed tickets, or mechanical devices showing names,—and depositories indicating the choice. The former is universal in modern times and most general in ancient.

The ballot must be nearly as old as the practice of voting by unprotected bodies of citizens; but our first knowledge of it is in classic Greece, where the *dikasts* (popular courts and juries) voted "yes" or "no" by balls of stone or metal (white or unpierced meaning acquittal, black or pierced indicating condemnation), by marked shells (*ostrakoi*, whence "ostracism" or banishment of an unpopular leader), or by olive leaves ("petalism"). In the assemblies the common voting was by show of hands, to secure public responsibility; in cases of privilege or ostracism it was by ballot. In Rome the first ballot law (though far from the first balloting) was the Gabinian, 139 B.C., and the machinery is very modern: *tabellæ*, or tickets, with candidates' names, or "yes" and "no" ballots for changes in the laws; boxes, inspectors, and check-lists; but in case of a tie the candidates drew lots. In the mediæval republics the ballot was a regular machinery; but it has been bitterly fought and slow of introduction in all non-republican countries, the governments and the privileged classes being loth to weaken their power of dragging their officials or the lower classes into obedience. In Scotland it was used in 1662 under the name of "billeting" to banish political opponents (ostracism); but the English government disallowed the act. In England it was first put forward to protect members of parliament against government revenge for voting against its bills, not the electors against the classes which furnished the members of parliament; in 1710 the House of Commons passed a ballot law, but the Lords threw it out.

In the modern world the American colonies of England were by far the first to make the ballot (voting "by papers") the foundation of the governmental system: they used it from the first, and it was made obligatory in several of the State constitutions adopted in 1776. New York, with its great landed aristocracy, was slower, using it only for the governor and lieutenant-governor in 1778, and not extending it to the legislature till 1787. The southern States held to the *viva voce* system for many years after, and Kentucky till 1891, its constitution providing for it, though the United States statutes compelled it to use written or printed ballots for Congressional elections. All the State constitutions now provide for elections by ballot.

In Great Britain it was not only fought by the privileged classes as overthrowing their leadership of the tenants and artisans, but by a large part even of the Liberals as undermining the manliness of the English character. The vanguard of the movement were the Benthamites, and it stood foremost in the programme of reform put forward by the more radical Whigs early in the 19th century. It was in the first draft of the Reform Bill of 1832; in 1833 Grote the historian introduced it, and repeated the attempt every year till 1839 with a fresh speech of immense force and learning. It was supported by Macaulay with his usual effectiveness, but was sneered at by so good a Liberal as Sydney Smith, and heartily supported by none but the Chartists, whose support alone would have killed it. They made it one of the "six points" of their "People's Charter." In 1851 it was carried in the Commons by 51 majority against Lord John Russell and his Liberal government, but went no further. In 1869 it was tried at Manchester as a test, and worked well; was adopted at school-board elections in 1870; and the same year a select committee of the House, headed by Lord Hartington, reported in its favor as a means of lessening corruption, "treating," and intimidation. In 1872 Mr. W. E. Forster's ballot act made printed ballots compulsory at all national and municipal elections except those of university candidates for parliament. This put an end to the drunken riots attending the previous public nominations at the hustings, so keenly satirized by Dickens and others.

In France, Spain, Belgium, Switzerland, and Cisleithan Austria the ballot is now used; in Hungary it was formerly employed in all elections, but in 1874 was restricted to municipal councils.

The interest of governments and privileged classes in aristocratic countries to defeat the secrecy of the ballot is replaced in democratic ones, of which the United States is chief, by the interest of party managers, who wish either to prevent independent voting through fear of loss of employment or favor, or to make sure of purchased votes being given as promised; they have therefore devised various methods of evading the nominal secrecy of the vote, such as ordering the voter to write his name or some understood sign on the ballot before depositing it, holding it in sight of the party watcher while casting it, having a "friend" accompany him to the polls on pretense of his illiteracy and inability to go through the legal forms without help, etc. These enforce as constant a struggle from

BALLOU

the guardians of political honesty to circumvent them: the first has been stopped by throwing out as illegal all ballots with distinguishing marks on them; the second by compelling them to be cast in sealed official envelopes, and by forbidding any but the official registrars to come within a certain distance of the polls for any purpose but to vote, and later by providing booths in which each voter prepares his ballot in privacy; the third is practically confined to certain States and cities with a large percentage of real illiteracy under which the feigned article can cover itself and cannot well be directly reached by law, but only by the vigilance of each party in exposing the fraudulent practices of the other. The ballot itself also has brought in many frauds for which the *viva voce* system gave no opportunity, which are reducible to three kinds: (1) counterfeiting, either by printing the name of one party over the candidates of another, or by substituting one or more names on the opposite party's ticket; (2) "stuffing" the ballot-box by folding two or more ballots, all but one being sometimes of tissue paper, to look like one; (3) "repeating," one man voting at different polling-places more than once or at the same one under different names. The first must be defeated by party vigilance; the second is used only where one party has the control of ballot inspection, though the law usually provides that both the chief parties shall have a share in this; the third and second are punishable by law.

Another evil, as diminishing individual responsibility for votes and building up unprincipled and corrupt party dominance, though not direct fraud like the others, is the "party ballot." This is due to the great multiplication of candidates to be voted for at one time, and the consequent cost of printing and distributing the ballots to voters, which has led to the abandonment of the candidates themselves doing this work, and the forming of party organizations for it, which, in return for their efforts insist on subservience and are apt to have slight scruples about gaining their ends. All these evils together—the misuse of ballot methods to pervert their intent, the only partial secrecy, and the supremacy of party in the voting—have latterly built up a great body of opinion that some better methods should be devised, the general movement being known as "ballot reform."

The party ballot has in many States been set aside by some form of the so-called "Australian ballot" (from its first use in South Australia), or official ballot, furnished by the State. The essential feature of the plan is that all candidates in the field for any office shall be placed on one ballot, and the voter compelled to indicate his preference by a mark against one; thus forcing him to think personally concerning each one, inviting to independence of judgment, breaking down the tyranny of the party vote, and putting some intelligence into the "brute vote" even though the name of the party of each candidate is added. The first States to adopt the system were Massachusetts for the whole State, and Kentucky for Louisville, in 1888; and in 1895 every State in the Union except Georgia, Louisiana, and North and South Carolina had adopted some modification of the system. But the modifications were important; they were due to struggles of the local party organizations for one of two objects, or both,—to defeat the secrecy of the new régime and keep

track of the purchased votes, or to prevent "scratching" and ensure that their voters should cast "straight tickets"; in other words, to emasculate the system of its vital principle. The ideal and typical form is the "blanket ballot," wherein all candidates are given in the alphabetical order of the offices without regard to party; but this is strongly opposed on the nominal ground that the illiterate voters, and a large part of those not technically such, do not wish to vote anything but the straight party ticket, and should not be hindered in their choice, much less deprived of it. In concession to this useful element of citizenship, most of the States group the names and offices by parties. In general there is a blanket ballot with all parties on it, but each party given a column by itself, with some conspicuous device, like an eagle or a star, at its head, which the illiterate can be taught to recognize, the voter, in order to vote the straight ticket, making a cross in the circle under the emblem, while for a scattered or split vote he makes the cross in the space before the desired name. In New York and New Jersey this is carried further still, each party having a separate ticket and pasters being allowed; which is in fact the old-fashioned sort, the modifications having taken all the distinctive features out of the system, except the State supply.

A newer feature of ballot reform is the substitution for the ballot paper, which is folded and deposited by hand, of voting-machines, which are contrivances that both record the votes and count them, enabling the inspectors to see at any moment how many votes have been cast, and for whom. Several States have authorized the use of machines, and others are considering the matter. Three varieties of the voting-machine have been legally sanctioned: (1) The Myers, in which the single ballot is placed in a frame having a push-knob for each candidate, the voter indicating his choice by pushing the knob opposite his candidate's name, when the machine indicates the vote on a dial at the back of the frame, and locks the knobs of all other candidates for the same office (before a second voter is ready, all knobs are unlocked); (2) the McTammany, which contains on its face a slot for each office, beneath which is a card bearing the names of the candidates for the office seen through the slot, the voter's choice being indicated by turning a wheel till the name of his candidate appears, when he pushes a knob which punctures the tally-sheet; and (3) the Rhines, in which the names are arranged as in the Myers, by parties and offices. Slip names are inserted in the push buttons; and separate tally-sheets for each candidate, with vertical serial numbers, are placed beneath the face, the voter pushing a button which places a punch in such a position for each name that when the lid of the machine is closed the next number on each tally-sheet is punctured. See UNITED STATES, BEGINNINGS OF PARTY ORGANIZATION IN THE.

Ballou', Hosea, American clergyman and author: b. Richmond, N. H., 30 April 1771; d. Boston, Mass., 7 June 1852. His boyhood was spent in the greatest poverty, but at 21 he began to preach, having adopted the Universalist doctrines. He was successively pastor of congregations in Dana, Mass.; Barnard, Vt.; Ports-

BALLOU — BALMEZ

mouth, N. H., and Boston, Mass., in which latter place he held his pastorate for more than 35 years. He founded the 'Universalist Magazine,' subsequently called 'The Universalist Expositor,' and again the 'Universalist Quarterly Review.' A voluminous writer, his chief works are: 'Notes on the Parables' (1804); 'Lecture Sermons' (1831); 'Examination of the Doctrine of Future Retribution' (1834), his most important contribution to theological literature. His published works would make more than a hundred 12mo volumes.

Ballou', Maturin Murray, American journalist, son of Hosea Ballou: b. Boston, 14 April 1820; d. 27 March 1895. Besides editing 'Ballou's Pictorial,' 'The Flag of Our Union,' 'Ballou's Monthly,' etc., and making a valuable compilation of quotations, he wrote 'History of Cuba' (1854); 'Biography of Hosea Ballou,' 'Life Work of Hosea Ballou.' Becoming in later life an extensive traveler, he wrote a number of books of travel, including 'Due West,' 'Due South' (1885); 'Due North,' 'Under the Southern Cross,' 'Footprints of Travel,' etc. In 1872 he became one of the founders and the editor-in-chief of the Boston *Globe*.

Ball's Bluff, Va., a point on the Potomac River, about 33 miles above Washington, where the bank rises about 150 feet above the level of the river. It is noted as the scene of a battle between a Union force under Col Edward D. Baker, and a Confederate force under the command of Gen Evans, 21 Oct 1861. The battle resulted in the serious defeat of the Union force and the instantaneous death of Col. Baker.

Ballston Spa, N. Y., county-seat of Saratoga County, on the Delaware & Hudson R.R., seven miles south of Saratoga Springs. It is noted for its mineral springs, which rank among the best acidulous chalybeate springs in the country, and was formerly a popular summer resort, but is now most important for its manufactories, which include one of the largest tanneries in the world; extensive pulp and paper mills, and agricultural implement factories. It has two national banks, several churches, public high school, and daily and weekly newspapers. Pop. (1900) 3,923.

Ballyme'na, a market town in County Antrim, Ireland, on the River Braid, 25 miles northwest of Carrickfergus. It has a cotton-spinning mill, a distillery, numerous bleaching-grounds, a church, chapels, large public schools, several branch banks, and a United States consular agency. Pop. (1900) 9,000.

Balm (*Melissa officinalis*), a perennial herb of the natural order *Labiata*, native of southern Europe, cultivated for culinary use and found wild as an escape in many countries. It attains a height of about 18 inches, is much branched, has ovate leaves and whorls of white or yellowish axillary flowers rich in nectar, for which the plant is sometimes cultivated as bee-forage. Its foliage, which has a lemon-like odor and slightly aromatic taste, is used to flavor wine and to a small extent in domestic medicine. Some other members of the *Labiata* are called balm—for instance: Bastard balm (*Melittis melissophyllum*), a handsome member of the same family, often dried for its long-enduring fragrance. Moldavian balm (*Dracocephalum moldavica*), a Siberian annual of less pleas-

ant qualities than true balm, largely used in Germany for flavoring. Horse balm (*Collinsomia canadensis*) and tea balm (*Monarda didyma*) are American species of little importance. A variety of catnip (*Nepeta cataria*) so closely resembles true balm as often to be mistaken for it. For cultivation see HERBS (*Culinary*).

Balm of Gilead, a liquid resinous balsam highly reputed in the East since Bible times for its fragrance and supposed medicinal properties, believed to be derived from *Commiphora opobalsamum*, a small Abyssinian and Arabian tree. Balm of Mecca, or opobalsam, is a specially high grade of balm of Gilead obtained from incisions in the bark. The wood and fruit are boiled to obtain the inferior grades. The balm of Gilead of the United States is a variety of poplar (*Populus balsamifera*, var. *candicans*). See POPLAR.

Balmaceda, bál-ma-sá'da, **José Manuel**, Chilean statesman: b. Santiago, 1840; d. 18 Sept. 1891. He was educated at the Seminario Conciliar in Santiago; early became noted as an orator, urging radical reforms in the Constitution of 1833; and was a founder of the Reform Club in 1868. As deputy for five terms, 1870-85, he urged the separation of Church and State and became the leader of the Progressives. He was Chilean minister at Buenos Ayres in the early part of the Chile-Peru war, 1879-83, and secured the neutrality of Argentina. In 1882 he was made minister of the interior, and introduced liberalizing bills, as for civil marriage, etc. In 1885 he was elected senator and appointed minister of foreign affairs. Elected president in 1886, he carried out large schemes of reform and democratization; popular education was extended, civil marriage carried in 1888, railroads and other internal improvements forwarded. But both his measures and men involved war against the clerico-oligarchy which not only ruled the state but monopolized the offices, and comprised the bulk of the property and influence; and when he tried to prevent the ruin of his work by "influencing" the election of a like successor, his opponents blocked the administration. He appointed a ministry of his own stripe and dissolved Congress, virtually making himself dictator; but the Congressionalists, having the naval officers on their side, began war 7 Jan. 1891, secured the nitrate provinces, and, using their revenues to buy the best arms and munitions, utterly routed Balmaceda's forces in a decisive battle near Valparaíso, 7 August. He took refuge in the Argentine legation at Santiago, and committed suicide there a few weeks later.

Balme, bām, **Col de**, an Alpine pass, forming the boundary between Savoy and the Valais, 7,218 feet above sea-level. It is much visited, and has a travelers' refuge.

Balmerino, bāl-mer-ē'nō, **Arthur Elphinstone, Lord**, Scottish Jacobite: b. 1688; d. 1746. He took part in the rebellion of 1715, and fought at Sheriffmuir. Having joined the Young Pretender in 1745, he was taken prisoner at Culloden, tried at Westminster, found guilty and beheaded. His title was from Balmerino, in Fife.

Balmez, bāl'méth, or **Balmes**, bāl'mes, **Jaime Luciano**, Spanish priest and author: b. Catalonia, 28 Aug. 1810; d. 9 July 1848. His works include 'Protestantism Compared with

Catholicism in Its Relation to European Civilization' (3 vols. 1848); 'Filosofia Fundamental,' etc.

Balmoral (bál-mór'al) **Castle**, the favorite Highland residence of the late Queen Victoria, beautifully situated on the south bank of the Dee, 48 miles west of Aberdeen, and in the county of the same name. The site on which it stands is almost completely hemmed in by majestic mountains, and the views from the castle are magnificent. Balmoral was originally a shooting-lodge of the Earl of Fife, but was leased to, and greatly enlarged by, a brother of the Earl of Aberdeen, and in 1848 the reversion of the lease was purchased by Prince Albert. The accommodation furnished by the old building was very inadequate, and accordingly, the property having been purchased in 1852, the present mansion was erected shortly afterward. It underwent some enlargement in 1888. It is built of gray granite, in the Scottish baronial style, and has a massive and imposing appearance in the distance. It consists of two blocks connected by wings, and has a massive tower 80 feet high, with a turret of 20 feet high. The estate, which was the queen's private property, comprises some 40,000 acres, three fourths being deer-forest.

Balnaves, bál-náv'ës, **Henry**, Scottish reformer: b. Kirkcaldy, 1520; d. 1579. He was educated at St. Andrews, and though at first a Roman Catholic he became a Protestant and made open profession of his faith in 1542, joining the English against Gov. Arran. He was accused of connection with the conspiracy to murder Cardinal Beaton, and was declared a traitor and excommunicated. In 1547 he was one of the prisoners taken in the Castle of St. Andrews and exiled to France, where he wrote his 'Confession of Faith.' Recalled in 1559, he busily engaged in the establishment of the reformed faith, assisted in revising the 'Book of Discipline,' and accompanied Murray to England in connection with Darnley's murder.

Balneology. See BATHS; HYDROPATHY; HYDROTHERAPY.

Balolo, ba-lô'lô, a large Bantu nation in the Equatorial Province of the Congo Free State, inhabiting the forests on the banks of the Chuapa, Bussera, and Lomami. Its settlements are interspersed with the villages of the Batwa dwarfs. The principal tribes of the Balolo are the Boruki, Bangombe, Dulingo, Imballa, and Kimoma. Agriculture exists among them to a certain extent, but they follow no pastoral pursuits. According to V. François all Balolo tribes are addicted to cannibalism. The territories inhabited by the Balolo belong to the most promising of Equatorial Africa, especially as the climate is more favorable to Europeans than it is in many other parts of the Congo Free State.

Balsa, bál'sa, a kind of raft or float, of the nature of a catamaran (q.v.), used on the coasts and rivers of Peru and other parts of South America for fishing, for landing goods and passengers through a heavy surf, and for other purposes where buoyancy is chiefly wanted. It is sometimes formed of two inflated hides connected by a sort of platform on which the fisherman, passengers, or goods are placed; and sometimes of a very light wood.

Balsam (*Impatiens balsamina*), an East Indian herb of the natural order *Geraniaceæ*, cultivated in gardens for more than 300 years. The plant is an erect free-branching annual sometimes 30 inches tall; bears axillary, diversely tinted yellow, white, or red single or often double flowers, the latter of which are called camellia-flowered varieties. The plant is a general favorite of easiest culture.

Balsamo, Joseph. See CAGLIOSTRO.

Balsamodendron, bal-sa-mô-den'drôn, a genus of trees or bushes of the order *Amyridaceæ*, species of which yield such balsamic or resinous substances as balm of Gilead, bdellium, myrrh, etc. See BALSAM.

Balsams, mixtures of resins in volatile oils, the term, however, being popularly applied to any aromatic compound with volatile oils. Balsams are very widely distributed throughout the plant kingdom. They are particularly abundant in the members of the pine family. The arancarias yield a copal that is almost a pure resin; many species of pines yield turpentine and resin; Canada balsam is derived from *Abies balsamea*; the balsam-like sandarach is from a cypress. The *Hamamelis* family gives balsam of styrax, and balsam of caparba is derived from a large number of the legumes and from the *Dipterocarpeæ*. Styrax benzoin is from the *Storax* family. The resins and balsams of commerce are very closely allied. They may be divided into three groups: gum resins, such as asafoetida and ammoniacum; balsams, and resins, such as turpentine, resin, coparba, mastic, elemi, copal, dammar, and sandarach; and the balsams and resins that contain cinnamic or benzoic acids, from which they derive their aromatic odor. It is to this latter group that the word balsam is popularly applied. These are balsam of tolu, balsam of Peru, storax, benzoin, dragon's-blood and xanthorrhæa resin.

These various bodies are for the most part secreted in special passages in the plants. Sometimes they are formed in the leaves, but for the most part the resinous solution collects in specially designed portions of the stem, usually in the woody portion. It is obtained in a variety of ways from simple incision to boiling chips of the wood with water.

In medicine most of these bodies are active. They are energetic oxidizers,—hence the traditions about ozone and pure air in pine-clad hills,—and several of the hydrocarbons in the volatile oils are stimulating to the skin and mucous membranes, turpentine being an excellent example. It is an excellent external antiseptic, and manifests similar properties on the respiratory, intestinal, and genito-urinary tracts. Those resinous or balsamic mixtures containing cinnamic and benzoic acids—notably balsam of tolu (from *Toluifera pereiræ*) and balsam of Peru (from *Toluifera balsamum*) possess similar antiseptic and stimulating properties. They are more powerful in proportion to the aromatic acids contained. Balsam of storax is derived from a tree, *Liquidambar styraciflua*. It has similar properties to the balsam of Peru.

The chrism (see SACRAMENTS) used for consecration and sacramental services should be made of balsam from Syria or Mecca; when this is difficult to obtain, balsams from Brazil or Peru may be used.

BALTA—BALTIC SEA

Balta, bāl'ta, **Jose**, Peruvian statesman: b. Lima, 1816; d. 26 July 1872. He retired from the army with the rank of colonel in 1855; was minister of war in 1865; one of the leaders in the insurrection which overthrew the unconstitutional president, Prado, in 1868; and was president of Peru, 1868-72. He was murdered in a military mutiny in Lima.

Balta, a town of Russian Poland, on the Kodema, one of the tributaries of the Bug, in the government of Podolia, 132 miles east-southeast of Kamieniec. Pop. about 32,000.

Baltard, bāl-tār, **Louis Pierre**, French architect and engraver: b. Paris, 9 July 1765; d. 22 Jan. 1846. He was appointed architect of the Pantheon and of the Paris prisons, and designed the chapels of the houses of detention of St. Lazare and St. Pelagie. The great hall of justice in Lyons, founded in 1834, was devised and almost completed by him. He also acquired fame as an engraver and as the author of many superb works descriptive of monuments and illustrated by his own plates. Among his most notable works in this line are 'Paris and Its Monuments'; 'La Colonne de la Grande Armée'; and illustrations in Denon's 'Egypt.'

Baltard, Victor, French architect: b. Paris, 19 June 1805; d. 14 Jan. 1874. He was son of Louis Pierre Baltard, and became government architect of France and a member of the Academy of Fine Arts. He built the church of St. Augustine and other beautiful edifices, and was author of 'Monographie de la Villa Medius' (1847), etc.

Balthazar, bāl-thā'zār, (1) one of the wise men of the East who came to worship Jesus at Bethlehem. (2) A character in Eichberg's opera, 'The Doctor of Alcantara.' (3) Chaucer's name for Belshazzar in 'The Monk's Tale.' (4) The name assumed by Portia in Shakespeare's 'Merchant of Venice'; also the name of minor characters in several of Shakespeare's plays.

Baltic (bāl'tic) and **North Sea Canal**, or **Kaiser Wilhelm Canal**. See CANALS.

Baltic, **Battle of the**, a poem by Thomas Campbell, celebrating the victory of Lord Nelson over the Danish fleet, 2 April 1801. In history this action is generally known as the battle of Copenhagen.

Baltic Lake Plateau, a low plateau extending from East Prussia to Schleswig-Holstein and Jutland, parallel to the south coast of the Baltic Sea; 750 miles long. In its eastern part the highest points are the Thurmberg, near Dantzic (1,086 feet), and the Kernsdorf Mountain (1,027 feet); more to the west, in Mecklenburg and Schleswig-Holstein, the altitudes decrease and the elevations become less defined, but even the last offshoots of the plateau in Schleswig and Jutland are of importance, as they form the watershed between the basins of the Baltic and North Sea. A characteristic feature of the region is the large number of lakes and ponds, some with very irregular outlines, others occupying wide basins or narrow river-like channels. The largest of these lakes are the Müritz-See (93 square miles) in Mecklenburg, and the Spirding-See (46 square miles) in East Prussia. Many of these lakes (mostly very small) in the eastern section (Pomerania and West Prussia) are without visible outlet. According to the

most recent investigations the lake basins date from the glacial period, when a massive sheet of ice covered North Germany, the ridges and hollows of this plateau being due to the action of the ice.

Baltic Provinces (in Russia), a term generally given to the five Russian governments bordering on the Baltic, namely, Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense it often designates the first three. The Baltic provinces once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th century, through the conquests of Peter the Great, partly under Alexander in 1809. No pains have been spared to Russianize them, and since 1876-7 they have lost their remaining privileges and been thoroughly incorporated in the Russian empire. They form, however, a borderland between the Germanic and Slavonic areas, and have been a frequent cause of difficulty between Germany and Russia. The bulk of the population is composed of Esths and Letts; the Germans number above 200,000, the Russians only 65,000. The five provinces combined have an area of 191,526 square miles, and a population (1897) of 7,015,126.

Baltic Sea, an inlet or gulf of the North Sea, with which it is connected by the Skagerrack and Kattegat. It washes the coasts of Denmark, Germany, Courland, Livonia, and other parts of Russia and of Sweden, and extends to lat. 65° 30' N. It is nearly 900 miles long, from 40 to 200 broad, and its superficial extent, together with the contents of the gulfs of Bothnia and Finland, amounts to 160,000 square miles. Its small breadth; its depth, amounting on an average to from 40 to 50 fathoms, but in many places hardly half so much; its shallowness toward the Prussian shores, and the rugged nature of the Swedish coasts; but above all, the sudden and frequent changes of the wind, accompanied by violent storms, render this sea dangerous for navigators, although its waves are less powerful than those of the North Sea. A chain of islands separates the southern part from the northern, or the Gulf of Bothnia. In the northeast the Gulf of Finland stretches eastward and separates the province of Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurisches Haff and the Frisches Haff are inlets or lagoons on the Prussian coast. The water of the Baltic is colder and clearer than that of the ocean; it contains a smaller proportion of salt, and ice obstructs the navigation three or four months in the year. The ebb and flow of the tide are inconsiderable, as is the case in other inland seas, the difference between high-water and low-water mark being only about a foot; yet the water rises and falls from time to time, probably owing to the varying rainfall and evaporation. In stormy weather amber is often found on the coasts of Prussia and Courland, which the waves wash upon the shore. Many streams empty themselves into the Baltic; among them are the Neva, Dwina, Oder, Vistula, Niemen, and a number of Swedish rivers. Between the Kattegat and Baltic are the large Danish islands Zealand and Funen; others in the sea itself are Samsoe, Moen, Bornholm, Langeland,

BALTIMORE; BALTIMORE FAMILY

Laaland, which belong to Denmark; the Swedish islands—Gottland and Oeland (besides Hveen in the sound, with the ruins of Oranienburg, the observatory built by Tycho Brahe); Rugen, belonging to Prussia; the Aland Islands at the entrance of the Gulf of Bothnia, and Dagoe, together with Oesel, on the coast of Livonia, all of which belong to Russia. The sound, the Great and the Little Belt lead from the Kattegat into the Baltic. The Baltic and North Sea are now connected by the great ship canal constructed between the Elbe, near its mouth, and Kiel Bay, and opened in 1895. The canal is a work of the German government, and is intended for the use of war-vessels as well as trading-ships, many of which, bound to or from Baltic ports, will be able to effect a great saving by means of this water-way. The chief sea-ports of the Baltic are St. Petersburg, Kronstadt, Riga, Revel, Narva, Libau, in Russia; Stockholm, Gefle, Karlskrona, in Sweden; Memel, Königsberg, Danzig, Stettin, Lubeck, and Kiel, in Germany; Copenhagen, in Denmark.

Bal'timore, Barons of, or Lords Baltimore. See BALTIMORE FAMILY.

Baltimore Family, founders and proprietors of Maryland, consists of seven successive lords of the barony of Baltimore in the Irish peerage, and a cadet who was governor has been added.

GEORGE CALVERT, the first lord: b. 1580, Kipling, near Bolton Castle, Yorkshire; d. 15 April 1632. He graduated from Trinity College, Oxford, 1597; traveled abroad, and after his return became secretary to Sir Robert Cecil (afterward Lord Salisbury), clerk of the Crown in Ireland, 1606, and clerk of the Council, 1608. He assisted James in his controversial writings, had charge of the Spanish and Italian correspondence during the secretary of state's absence in 1613, was on a committee to investigate Irish Catholic grievances the same year, was knighted 1617, and in 1619 was made secretary of state by Buckingham's favor. He represented Yorkshire jointly with Sir Thomas Wentworth (afterward Lord Strafford) in the parliament of 1621, and in the stormy times that followed was a mediator between Parliament and king, with the usual fate of being thought a spy by the one and lukewarm by the other. The French ambassador styled him an honest, sensible, well-intentioned man and zealous patriot, and therefore without influence. He had principal charge of the foreign negotiations while James was chasing the will-o'-the-wisp of the Spanish marriage and making England a nullity in the Thirty Years' war; Calvert's later Catholicism made him suspected as favoring the latter policy, but in fact he wished a more energetic one. On 14 Jan. 1624 he was one of the nine councilors who opposed a breach with Spain. In January 1625 he announced himself a Roman Catholic; his conversion is credited to Gondomar, the famous Spanish ambassador, and Lord Arundel of Wardour, his son's father-in-law. On 12 February he resigned his office and was given the barony of Baltimore; which, as James hated "apostasy," measures his esteem for Calvert. On the accession of Charles I., in 1625, Baltimore refused, from conscientious scruples, to take the oath of supremacy and abjuration, and

Charles gave him a handsome letter to the Lord Deputy of Ireland. In 1627 he was summoned to court to consult on the peace with Spain, but thenceforth took no part in public business, devoting himself to colonization. Already in 1621-2 he had planted a colony in Newfoundland, chartered in 1623 as Avalon; in 1627 and 1628-9 he visited it, but the severe climate disappointed him and he begged for a grant in a milder one. Without waiting for a reply he attempted to explore Virginia for a settlement; but the Jamestown officials of the old Virginia Company refused permission unless he would take the oath above. The region satisfied his ideal, however, and he persisted in asking a grant there against the dissuasions of Charles, who finally assigned him a northeastern tract, now the States of Maryland and Delaware; but the same interests delayed the proceedings, and before the charter was signed, 20 June, Baltimore died. The usual assumption that he intended the colony for a Roman Catholic establishment is not only absurd in itself, as public feeling would not have allowed it to be thought of, but is answered by the fact that the charter established the Church of England and did not even specify toleration for other creeds, which was not made a provision of law till 1649, though of course intended, and proclaimed at once on the establishment of the colony. Baltimore thought—wrongly, as it turned out—that the proprietary's power and the religion of the chosen colonists would prevent the persecution of his own faith, and had neither wish nor power to persecute others. That he meant it as an asylum and breeding-ground for his religion is a matter of course. It was also to be a feudal aristocracy, but with an assembly of freemen whose consent was necessary to the validity of laws. In a word, Baltimore was a conservative of high principles and moderate temper.

CECILIUS, or CECIL CALVERT, the second lord: b. about 1605; d. 30 Nov. 1675. He married Anne Howard, daughter of Lord Arundel of Wardour (after whom Anne Arundel County of Maryland is named), about 1623. The charter of Maryland granted to his father was transferred to him as heritor; but he never visited it during the 43 years of his life thereafter, sending deputies in his place, and managing its business and political affairs judiciously from England, settling disputes of natives or colonists sensibly and placably, and esteemed a worthy successor to his father. Down to the civil war of 1642 he had little to do but support his brother, Leonard, as governor; but his policy then became difficult. He tried to steer a middle course, and avoid either for himself or the colony any pronounced declaration of sympathies or allegiance which might expose it to confiscation; but Ingle's upset of the colonial government (see **LEONARD CALVERT**), and the parliamentary triumphs at home, showed him at last that this could not be maintained, and that with the Puritans at the head, the Roman Catholic supremacy, though used only to preserve themselves from persecution, must be given up. On 9 June 1647 Leonard died, after appointing as his provisional successor an ardent Churchman and loyalist, Thomas Green; but Lord Baltimore in 1648 appointed Capt. William Stone and had him settle some 500 Puritans, harried by the Vir-

BALTIMORE

ginia Cavaliers, in Maryland. When the news of the king's death arrived, Green, in Stone's absence, proclaimed Charles II. king, as did Virginia; on which William Claiborne (q.v., and below), the treasurer of Virginia, joined the Parliamentary party, obtained a commission to reduce the two rebellious provinces, and, after overthrowing the Virginia government, forced Gov. Stone to renounce his allegiance to Lord Baltimore and give it to the "keepers of the liberties of England." When Cromwell dispersed the Long Parliament Stone repudiated the agreement; Claiborne marched against him, deposed him, and appointed a Puritan government which at once most ungratefully disfranchised all Catholics and repealed the colonial toleration act of 1649. In January 1654 Cromwell himself intervened, and forbade the Virginia authorities to molest Lord Baltimore or his officers in Maryland. Baltimore thereupon ordered Stone to overturn the Puritan government, but Stone's force was defeated and himself captured. Baltimore, however, kept his favor with the Puritan administration; the commissioners of plantation decided that the province was his, and in 1658 it was restored to him. Claiborne's influence was at an end, and Baltimore had no further troubles over Maryland.

LEONARD CALVERT, younger brother of Cecilus, was sent out by the latter as first governor of the new colony: b. about 1606; d. June 1647. He set sail 22 Nov. 1633, in the Ark and the Dove, with about 200 Roman Catholic settlers of good families; arrived 24 Feb. 1634, at Point Comfort, landed 25 March on an island in the Potomac, which they named St. Clement's, and founded on the site of an abandoned Indian village a town, St. Mary's, long since deserted. He met an Englishman, Capt. Henry Fleet, who had lived some years among the Indians, and helped him to gain their consent to the settlement. But he found Kent Island in the Chesapeake, the great island opposite Annapolis, settled by one William Claiborne (q.v.), under a grant from the dissolved Virginia Company, effectively enough to have a representative in the Virginia legislature. Calvert claimed right of property and political jurisdiction over the island, Claiborne denied both, and Virginia upheld him; and the warfare that ensued embroiled the two colonies for many years, complicating itself with the issue of Churchmen against Catholics, then (by the oddest irony of fate) with Cavaliers in Virginia against the Puritans who had overborne the Catholics in Maryland, and finally with a rankling boundary dispute. Claiborne poisoned the Indians' minds against the Marylanders as a set of treacherous Spaniards; Calvert sent an expedition against him, which captured two boats, with mutual loss of life, in April and May 1635. Claiborne had further losses, and became bankrupt, but in 1637 bought of the Indians Palmer's Island, at the head of Chesapeake Bay, as beyond Baltimore's grant, and petitioned for an injunction against Baltimore's interfering with him. The commissioners of plantation refused him the grant, despite his purchase, on the ground that he had only a trading license. Meantime Kent Island continued insubordinate, and Calvert had to make an expedition against it in person, reducing it and occupying Palmer's Island also, and capturing one of Claiborne's

lieutenants, who was put to death for piracy and murder in the former troubles. Calvert now undertook to introduce the feudal system contemplated by his father's charter; but as the freemen's consent was necessary to this, and they refused to give it their own abasement, the scheme was blocked and in fact never was carried out. The civil war of 1642 having broken out, cautious steering was needed to avoid risking confiscation from one side or the other, and Calvert went to England to consult his brother, leaving one Brent as deputy; who brought on the very catastrophe dreaded, by seizing a Parliamentary vessel and imprisoning the captain, Richard Ingle. Ingle escaped, obtained letters of marque from Parliament, allied himself with Claiborne, who had been made the treasurer of Virginia for life by the king, but had no politics except for his own hand, and by the time Calvert returned with a new commission in 1644 had possession of the colony and was plundering right and left. Calvert, in an attempt at repossession, was defeated and fled to Virginia, which had remained loyal to the king, and appealed to the colonial government for help; they refused to give it; finally he got a force together, and in December 1646 returned and drove Ingle out—one of the flying rebels, however, carrying off all the early records of the colony, which have never reappeared. He died the next year, leaving an unfortunate provisional appointment of a successor, which made even worse trouble for the colony than the last deputy.

JOHN, the third lord; CHARLES, the fourth; BENEDICT, the fifth; CHARLES, the sixth; and FREDERICK, the seventh and last, complete the roll. Frederick was a foolish and worthless rake, and perhaps worse. Born in 1731, he died 14 Sept. 1771, leaving no legitimate heirs, but apparently a natural brood of some ability. The proprietary rights in Maryland were bequeathed to a child, Henry Harford, but four years later were rendered worthless by the Revolution.

Baltimore, Md., the chief city of the State, the sixth in population of the United States, and the commercial head of the Atlantic seaboard south of New York. It stands at the head of navigation and tide-water on the Patapsco River, 14 miles from its mouth at Chesapeake Bay and 200 from the Atlantic Ocean on the Pennsylvania (P, W. & B), Baltimore & O, W. Maryland, Baltimore & P, Northern Cent., and other R.R.'s; 38 miles northeast of Washington, 97 southwest of Philadelphia. Pop. (1900) 508,957; estimated (1903) 600,000. The Patapsco, properly a small stream south of the city, is a three-branched estuary, of which the northwest and middle branches pierce a group of low hills on which the city is built, and embrace a forked peninsula with Fort McHenry (famous for the origin of the "Star-Spangled Banner") guarding the harbor from the north fork. The northwest branch is the real harbor, on which the city first grew and around which it is situated; it is 3 miles long and $\frac{3}{4}$ of a mile wide in greatest width, the western end being a narrow inner basin, suddenly widening at the east to an outer harbor with a minimum depth of 24 feet; again narrowing to $\frac{1}{4}$ of a mile at Fort McHenry, beyond which the Patapsco is a bay several miles wide, with a 27-foot channel.

BALTIMORE

The harbor is really the separate estuary of a small stream called Jones Falls, which flows through the heart of the city. It formerly alternated between an almost waterless bed of noisome mud and a furious and destructive torrent, but is now restrained by stone embankments, and is fed in drouth from the Gunpowder River reservoirs to the north. Its valley in the northern part of the city is a great track-yard for the railroads approaching the Union station, and is spanned by numerous long and handsome steel bridges. The middle branch in like manner is the estuary of another small stream, Gwynn's Falls, which practically bounds the city west and southwest.

Baltimore covers about 32 square miles or over 20,000 acres; and has about 400 miles of streets, four fifths of them paved with cobblestones. It is laid out in a general rectangular form, kept from monotony not only by the picturesque variety of hill and hollow, but by the differences in plan and general direction of the original settlements joined to make up the present great city, or since annexed by it. Especially in the older portion, east of Jones Falls, there are several avenues radiating from the river at different angles; and Fremont Avenue on the west side is also a long street of this character. The business heart is west of Jones Falls; east of it is Old Town, with Fells Point, famous for shipbuilding, south on the harbor. The chief business street is West Baltimore (which as East Baltimore Street crosses the river through the Old Town); next in importance are Lexington Street, parallel to it on the north, and Calvert Street, north and south of Monument Square in the centre of the city (the core of the wholesale dry-goods district), also a residence street. Other notable ones are Calvert and North Calvert streets (north of Jones Falls), and Howard Street (north and south of the Baltimore & O. R.R.). These names commemorate the Calverts, the Lords Baltimore, who founded Maryland, and Col. John E. Howard, who gave the ground for Washington monument. The finest residence section is the northwest. The general impression of the city is that of solid blocks of low-red brick dwellings, the better ones with white marble doorstones and facings; and business and institutional buildings of the latter, beautiful in itself and in the architectural uses made of it. A favorite construction, peculiar to this city, is rough marble ashlar used with polished marble. The newer business buildings and the dwellings in the new quarters, however, are varied in material and design. The brick is from the inexhaustible beds of fine clay near by, the marble from quarries about 10 miles north, the granite from about 15 miles south.

Public Buildings and Monuments.—Baltimore was long ago named "the Monumental City" from its two noted landmarks, the Washington Monument in Mount Vernon Place, and Battle Monument in Monument Square, both of white marble. The former is a Doric shaft 180 feet high, including a pedestal of 50 feet, with a colossal statue of Washington on the top; 220 winding steps lead to the summit, whence is had a magnificent view of the city and vicinity. It was begun in 1816 and completed in 1830. Around it are the statues of Chief Justice Taney and George Peabody (a bronze by W. W. Story), and a number of superb animal

bronzes by Barye. The Battle Monument, 52½ feet high, was erected to the slain defenders of Baltimore against the British in 1814. Other heroes of the War of 1812 are commemorated by the Wells and McComas monument; those of the Revolution by the Sons of the Revolution monument. The Wilkey monument on Broadway, 52 feet high, is to the founder of the Odd Fellows' order in America; the Ridgely in Harlem Square, to another prominent Odd Fellow. Greenmount cemetery has one to John McDonogh, the eminent philanthropist (see *Charities*). Besides churches, the most prominent buildings architecturally are the white marble city hall, occupying an entire square of above half an acre, 355 feet long, Renaissance style, four stories high, with an iron dome and tower rising 260 feet from a marble base, and a fine interior, but built for its original estimate of \$2,600,000; the city court-house, completed in 1890, housing all courts but those of the United States, containing also the land records and the Barr Association library; the United States court-house; the Peabody Institute; the Enoch Pratt Free Library; the Masonic Temple; and the splendid Romanesque Maryland Club House—all of white marble; the custom-house, 240 feet by 141 feet, with a glazed dome 115 feet above the street, and with colonnades around it, each column a single block of Italian marble; the post-office; the jail, of granite; the Maryland Institute, of brick, 355 feet long; the Odd Fellows' Hall, of brick; the Johns Hopkins Hospital; the Mount Royal station of the Baltimore & O. R.R.; and the Garrett mansion of brownstone, a palace worthy to compare with many European ones. There are also several fine business buildings.

Churches.—Owing to Maryland's foundation as a Roman Catholic colony, and that element being long predominant and always powerful, Baltimore was the first see of that Church in North America. It is the seat of an archbishop, who is the primate of the United States. Its cathedral is an interesting building architecturally and historically; it is a massive granite structure, 190 feet long, 177 broad, and 127 high, and contains among its adornments two fine paintings presented by Louis XVI. and Charles X. of France. It dates from early in the 19th century. Besides the cathedral there are 42 Roman Catholic churches and 30 chapels, the most notable church buildings being those of St. Alphonsus and Corpus Christi, or the Jenkins Memorial. The Protestant denominations have about 200 church buildings. The Church of England erected its first church in 1731, and the Presbyterians their first in 1756. The first Methodist Church was organized in 1773, the first Baptist in 1780, and the first Quaker meeting-house was opened in 1781. The most notable Protestant church buildings are: Episcopal—Grace, Christ, and St. Peter's; Presbyterian—Westminster, First, and Brown Memorial; Methodist—Mount Vernon; and the Unitarian. Baltimore has also six Jewish synagogues, two of them of great beauty—that on Madison Avenue, and the White Temple on Eutaw Place.

Clubs.—The Maryland Club is the great social organization of Baltimore's leading citizens; it occupies a superb new building (1893) on Charles and Eager streets. The Baltimore Club, with a brownstone building on Charles

BALTIMORE

Street, opposite, was a secession of exclusively the sons of old Maryland Club members, on the issue of barring out treating and gambling. Others are the Phoenix, the Athenæum, Merchants', University, Catholic, and Germania (of German-Americans).

Educational Institutions, Art Galleries, and Libraries.—The most famous institution of learning in Baltimore is Johns Hopkins University (q.v.), opened in 1876, a post-graduate system which has lifted American instruction to the highest European level, so that foreign scholars come here as regularly as ours go to England and Germany, and the Johns Hopkins diploma ranks with that of any European university. It has also a medical school of equally world-wide distinction; and the Johns Hopkins Hospital is by deed a great clinic for it, as well as a training-school for nurses. Other medical schools are those of the University of Maryland (1807), the College of Physicians and Surgeons, and the Baltimore Medical College. The oldest dental college in the world is the Baltimore College of Dentistry and Surgery, chartered 1839. The chief law school is that of the University of Maryland. There are also many other colleges and preparatory schools of good rank, making the city a leading educational centre. Among these are Morgan College (Methodist Episcopal, 1876); the Woman's College of Baltimore (Methodist Episcopal, 1888), with a preparatory school in connection; Baltimore City College; Bryn Mawr School (1885); and four Roman Catholic institutions—St. Mary's (Seminary of St. Sulpice, 1791); Loyola (1852), under Jesuit management; Notre Dame of Maryland (1873); St. Joseph's (1888). The public school system has about 185 schools, over 1,800 teachers, and about 65,000 pupils, and about \$1,200,000 is annually expended in its support. The first manual-training schools for white or colored pupils were established here. There is also a State normal school and an institution for training colored teachers. The Maryland Institute of Art and Design is what its name implies; and the Peabody Institute gives lecture courses and includes a school of music as well as a great library and art galleries. Enoch Pratt, the founder of the Free Library, gave the Academy of Sciences a home in 1895. The Walters Art Collection, although the private property of the heirs of a great connoisseur, admits the public for part of the year, by the terms of his bequest. It is one of the most complete collections in the world of modern French and Spanish paintings, etchings, water-colors, ceramics, bronzes, etc. Each great educational institution and learned society has its own library. The chief of these is that of the Peabody Institute, with about 150,000 volumes. The Maryland Institute, Maryland Historical Society, and the Maryland Episcopal Diocese have theirs also; the Bar Association has its library in the city courthouse. The first free circulating library in the city was founded in 1886 by Enoch Pratt, a Baltimore merchant of New England birth, who gave it a building and a fund of \$833,333.33, on condition that the city should expend \$50,000 annually upon it. It has seven branches and over 200,000 volumes. There are also the Archbishop's, Odd Fellows', New Mercantile, Baltimore & Ohio Employees' Free Circulating, and other libraries.

Charitable Institutions.—The most splendidly endowed is the Johns Hopkins Hospital, which in 1873 received half of Johns Hopkins' fortune (over \$2,000,000), and was made a clinic for the medical school of the university, for which it has great laboratories. It occupies 13 acres and has 320 beds. The buildings were erected from the income of the bequest, the principal as yet remaining untouched. Others are the Maryland University Hospital, the City Hospital, and St. Joseph's Hospital. The Sheppard Insane Asylum, founded in 1890, had its endowment more than doubled in 1898 on condition of changing its name to the Sheppard and Enoch Pratt Hospital, and is the best endowed insane retreat in the United States. The Spring Grove Insane Asylum is a State institution accommodating about 300 patients. There are also the Maryland Institution for the Blind, with a beautiful white marble building accommodating about 50 patients; the city almshouse, called the Bay View Asylum, 1,714 feet long, with room for 500 inmates; the St. Mary's Industrial School and the House of Refuge for juvenile offenders; the McDonogh School for indigent children, endowed by John McDonogh, the Wilson Fund giving to poor children summer outings on the bay or at the Wilson sanatorium on Mount Wilson; the Samuel Ready Asylum for Female Orphans; and the Day Nursery.

Parks and Cemeteries.—The park system, purchased and maintained out of a franchise tax on the street railways of the city, which yields over \$200,000 a year, is one of the most extensive in the country. It includes about 1,250 acres of ground, and comprises playgrounds, fields for athletic exercises, comfort buildings, etc. The largest is Druid Hill Park on the north, unsurpassed in the United States for varied and unspoiled natural beauty improved by art; 671 acres of hill and dell, forest, ponds, and lawns, Prospect Hill commanding a wide view. It is named from its noble old oaks; was formerly the seat of the Rogers family, is still by deed their burying ground, and contains their mansion house. It has 16 miles of fine drives, including the fashionable drive of Baltimore, of one and one half miles around Druid Lake on the southern border, an artificial pond nearly three quarters of a mile long, a part of the city water-works. The park contains also flower-gardens, conservatories, and palm-houses; a zoological museum; the historical museum in the Maryland building at the Centennial Exposition of 1876 in Philadelphia, afterward moved hither; and the Wallace statue. The next largest is Clifton Park on the northeast, of 255 acres, the old Johns Hopkins estate, acquired by the city in 1895; there are also Patterson Park of 106 acres, in the Old Town near the harbor, with fine conservatories; Carroll Park on the extreme west, a part of the estate of the famous Carrolls of Carrollton, and containing their old mansion. South Baltimore has also Riverside Park of seven acres, and Federal Hill Park of three, the latter overlooking the basin. Highland Park is in the extreme northwest. There are two "schützen" parks, one on the northeast near Clifton Park, the other in the southwest; and many public squares, some with monuments. Around Battle monument are four open squares. There are several large and finely

BALTIMORE.

1. Washington Monument.
2 Johns Hopkins Hospital.

BALTIMORE.

1. Cathedral.

2. Battle Monument.

BALTIMORE

kept cemeteries; the largest is Baltimore cemetery, in the extreme northeast near Clifton Park; the most beautiful are Greenmount in the north centre, containing the McDonogh monument, and Loudon Park in the extreme west. Near the latter is Mount Olivet. St. Peter's (Roman Catholic) is on the northwest.

Water Supply, Fire Department, etc.—The water supply, formerly obtained wholly through Lake Roland, an artificial pond seven miles north of the city fed from Jones Falls, and very pure water, was supplemented in 1881 from Gunpowder River, about 11 miles north, through a tunnel 7 miles long and 12 feet in diameter. There are eight reservoirs, with a total capacity of 2,240,000 gallons, and 620 miles of mains; and the average flow of all the streams is 165,000,000 gallons a day. There are about 1,000 fire-plugs, 23 steam fire-engines, and 9 hook-and-ladder companies.

Trade, Commerce, Manufactures, and Transportation.—Baltimore, as the head of navigation on the great land-locked gulf of Chesapeake Bay, the Baltic of the middle United States, lying on the border of North and South, and therefore the natural distributing point for their products and manufactures, also as the most convenient port for the Ohio valley and adjacent parts, was destined by nature for a great commercial future of both domestic and foreign trade, and early became the focus of the great central highroads from the west. For the stages of its development see *History*, following. A curious advantage of its harbor is that its waters do not feed the *teredo* or timber-worm. When its first source of prosperity, the great "clipper" sailing commerce, began to decrease, it was fortunate in having new sources opened by the exploiting of coal and iron near by, for manufactures and shipping, and the accessibility of great forests for the lumber trade, and canals and railroads gave it as good internal communications as the bay afforded external ones. It built up new markets in South America, and of late years has regained much of its European importance. While in 1890 it was sixth among American cities in foreign trade, in 1900 it was third, second in exports, and fifth in imports; in 1901-2 its exports were \$106,239,081. It has more than a dozen steamship lines running regularly to all the leading English and Continental ports; three of the great transatlantic lines, the Norddeutscher Lloyd, the Hamburg-American Packet Line, and the Red Star (Antwerp) ply regularly from here. Besides these it has steamship lines to Boston, Halifax, Providence, New York, Wilmington, N. C., Charleston, Savannah, New Orleans, etc.; and steamboat lines to Philadelphia, Washington, Norfolk, Richmond, and other points on the bay and its tributaries. There are 8 or 10 coasting lines on the bay alone, chief of them the Old Bay Line to Norfolk. In 1902, 897 vessels of 529,118 gross tons cleared from the port of Baltimore for foreign ports, 380 sailing-vessels of 64,275 tons, and 517 steamers of 464,843 tons; and about 2,300 for American ports. The Delaware and Chesapeake ship canal, across the narrow strip of Delaware, gives it a direct water outlet to Philadelphia. Its railroads have already been mentioned. The Baltimore & Potomac has a tunnel 7,400 feet long through the west side of the city; the

Northern Central one 3,500 feet long through the northeast; the Baltimore & Ohio one 1 $\frac{2}{3}$ miles long through the city north to south. The Baltimore & Ohio road draws its trains through by electric motors. The huge grain-elevators of the Pennsylvania system are at Canton on the north side of the harbor, those of the Baltimore & Ohio Company at Locust Point on the south. Baltimore is the foremost corn-exporting port in the country, handling an average of 40,000,000 bushels a year, with 20,000,000 of other grain; one of the first in flour, handling about 3,500,000 barrels; it also sends out enormous amounts of other provisions, live stock, tobacco, boots and shoes, coal, naphtha, drain-pipe, copper (\$16,000,000 worth in 1900), etc. Its imports are copper (mainly to be re-exported), iron and manganese ores, cotton, coffee, West India products, etc. A leading industry, both of direct shipping and of preparation in its canneries, is that of oysters, in which it is first of the world. Its volume is seven to eight million bushels a season, from 1 September to 1 April, sending off sometimes 50 or 60 car-loads a day; the trade with the eastern shore of Maryland alone amounts to some 8,000,000 a day. Its canneries of fruit and vegetables are also of the first importance. Of other industries, that of iron and steel in Baltimore and vicinity has more than doubled during the last decade. The Maryland mines formerly produced charcoal pig-iron of a high grade, and the furnaces, rolling-mills, etc., later developing into armor-plate manufactories and steel works, were of great extent; but for a time the discovery of the Lake Superior ores drew the industry westward, and the chief Baltimore works were abandoned. In 1887, however, an epoch was made in this industry in the United States by the location at Sparrow Point, some miles down the Patapsco, of the great works of the Maryland Steel Company, costing some \$8,000,000, and importing the ores largely from Cuba, with some from Mediterranean ports; the coal and coke coming from Pennsylvania and West Virginia. Baltimore was formerly a great centre of wooden-ship building; iron ships for a time crippled this business, but of late there has been a revival of building the latter, including several vessels of the new navy—greatly aided by an immense dry-dock capable of receiving the largest vessels. Flour-milling is another heavy industry, one firm turning out over 2,000 barrels a day. Textile fabrics rank high; especially, it makes 80 per cent of all the cotton duck manufactured in the United States, and 60 per cent of all in the world. The volume of its leading industries as given by the census of 1900 was as follows, besides bread, shirts, carpenter and mason work, etc.: men's factory-made clothing, \$17,290,825; women's factory-made clothing, \$2,506,654—total clothing \$19,797,479; tobacco products, \$9,576,455; canning of fruits and vegetables, \$8,477,178; canning of oysters, \$2,364,968—total canneries, \$10,842,146; foundry and machine-shop work, \$6,119,973; slaughtering and meat-packing, \$5,308,334; fertilizers, \$3,752,328; malt liquors, \$2,934,028; furniture, \$2,690,610; confectionery, \$2,249,858; lumber and planing-mill products, \$1,809,868. The total number of manufacturing establishments is 6,359; capital invested, \$117,062,459; average number of wage-earners, 78,738; total wages,

BALTIMORE

\$29,220,460; cost of materials, \$87,175,134; value of products, \$161,249,240.

Finances, Banking, etc.—The assessed property valuation is about \$430,000,000, the net debt about \$33,000,000, and the tax rate about \$21.50 per \$1,000. The municipal expenditures are about \$8,000,000, of which \$1,575,000 is interest on debt, \$1,500,000 for schools, \$875,000 for police, and \$450,000 for the fire department. There are 21 national banks, with a capital of about \$11,750,000, and surplus of about \$4,500,000. The clearing-house transactions amount to \$1,202,000,000 a year. There are also a large number of State and private banks, loan and trust companies. The city has over \$100,000,000 invested in southern loans. It is the great United States centre of the fidelity and security business; its security and trust companies have an aggregate capital of \$21,650,000, and a surplus of over \$17,500,000.

Government.—By the revised charter the mayor holds office for four years; he has a veto which can be overridden by a three fourths vote of the council, which is composed of two branches: the lower, of 22 members, one from each ward; the upper, of 11 members, each from two contiguous wards. The bulk of the city officers are appointed by the mayor with the consent of the higher branch. In 1895, when a Republican mayor was elected after Democrats had held unbroken control of the city for 28 years, the Democratic council passed a resolution over the mayor's veto, transferring his power of appointment to themselves; but the Maryland court of appeals decided that they had exceeded their authority. The council has the right to appoint the city register and public printer; and the comptroller and surveyor are elected by popular vote.

Population.—The following are the figures from the first census to the last:

1790	13,503	1850	169,054
1800	26,514	1860	212,418
1810	46,555	1870	267,354
1820	62,738	1880	332,313
1830	80,620	1890	434,439
1840	102,313	1900	508,957

Except in 1850, when it stood third in population, it has varied from fifth to seventh in the United States. In 1900 the female population exceeded the male by 22,397. There were 440,357 native-born inhabitants against 68,600 foreign-born, over one half being Germans. Though nominally as much northern as southern, the city has always been southern in character and sympathies, owing to the large negro population; in 1900 this was 79,258, or nearly one sixth, and had increased by almost exactly one half since 1800. The only American city with a larger colored population is Washington. The death-rate in 1890 was 22.9 per 1,000, in 1900 21 per 1,000; but a peculiar feature well known to life-insurance companies is disclosed by the fact that the death-rate among the whites was only 19 per 1,000, but among the colored 31.1.

History.—John Smith, in 1608, made two voyages up Chesapeake Bay and its inlets of which he made a map. He was one of the first Europeans to explore this section. Cole's Harbor was named in 1668, changed in 1700 to Todd's Range, and in 1706 to Whetstone Point. The first land taken up was by Charles Gorsuch, a Quaker, who was granted 50 acres of land

here in 1662; David Jones settled on Jones Falls in 1682. In 1729 the General Assembly tried to locate a town south of the harbor, but were induced by the owner, who imagined there were iron deposits there, to change it to the north side; this was done 8 August, and in January 1730 it was so laid out west of Jones Falls. The same year a ship-carpenter, William Fells, settled at Fells' Point; in 1732 another town was laid out east of Jones Falls and called Jones Town (now the "Old Town" of Baltimore, the original Baltimore being the "New Town"). In 1745 this and Jones Town were consolidated as Baltimore; but even in 1752 it contained only 25 houses. In 1756, however, a colony of the deported Acadians settled near by, and in 1765 it had 50 houses and about 600 people. In 1767 the county-seat, which had been at Joppa since 1712, was removed to Baltimore, and a court-house built where Battle monument now stands. In 1773 a stage line to Philadelphia and New York was started, and the first newspaper,—*The Maryland Journal and Baltimore Advertiser*,—was issued 30 August; it suspended in 1797, and the first surviving one, the *American*, began 14 May 1799. The first theatre performances were given in 1773; the first theatre building was erected in 1781, and opened 15 Jan. 1782. In 1775 Baltimore had 564 houses and 6,755 people and had become an important port. The Revolution brought it prosperity by crippling its rivals, and it was a great seat of privateering. For a couple of months in 1776-7 Congress held session in one of its taverns, having fled from Philadelphia in fear of the English. In 1780 a custom-house was established, and in 1783 wardens of the port were appointed, though it had but one public wharf, and only three private ones extended over 200 feet. In 1784 a market was opened, the streets were lighted with oil lamps, and watchmen were appointed. About this period the energy and resources of a couple of immigrant Scotch-Irishmen, the brothers John and Henry Stevenson, began to push the place forward; new stage and packet lines were established, the roads improved and turnpikes laid out, and Jones Falls diked and part of its course filled in. The population doubled in the 15 years from 1775 to 1790, and then began a time of still greater prosperity. The European wars of the French Revolution and later threw a large part of the world's carrying-trade, till Napoleon's downfall, into American hands; the "Baltimore clippers" were famous everywhere, and the city nearly doubled again in the decade to 1800. In 1792 a large body of French refugees from Haiti came in. On 31 Dec. 1796 the old settlement at Fells' Point was united with it, and it received a city charter, it having previously been governed from Annapolis. In the War of 1812 it again became a seat of privateers, in revenge for which the British attempted its capture in 1814, but the attack was repulsed 12 September. To it we owe the "Star-Spangled Banner" (see KEY, FRANCIS SCOTT) and the Battle Monument. The end of the Napoleonic wars in 1815, restoring to England her old carrying trade, was a heavy blow to Baltimore; and though it built up some new South American trade the glory of the clippers departed. In 1817 it was first empowered to borrow money, a privilege it liberally utilized. In 1828 the public-school sys-

BALTIMORE COUNCILS — BALUCKI

tem was established. The same year work was begun on the Chesapeake and Ohio Canal, and on the Baltimore & O. R.R., and next year the Baltimore & S. R.R. was begun. Manufactures now began to develop largely.

In 1860 all three anti-Republican parties held their national conventions there; and on the outbreak of the Civil War the Union troops passing through there were mobbed by the citizens, and the first blood of the war was shed in its streets, 19 April 1861. On 13 May Federal Hill was occupied by a Union force, and the city remained under martial law till the end of the war. The convention of 1864, which re-nominated Lincoln, was held here. In 1888 "The Annex" was annexed to the city, extending its limits two miles north and west, and nearly doubling its size. Since 1890 Roland Park and Walbrook have also been annexed.

On Sunday, 7 Feb. 1904, fire destroyed the greater part of the business portion of the city. Eighty blocks of buildings, embracing nearly all of the finest public and private business structures, were burned. The loss was \$125,000,000. On account of the number of financial institutions involved, the governor convened a special session of the legislature, and the Federal troops having taken possession of the burnt district, martial law was proclaimed for one week.

Baltistan, bāl-te-stān', or **Little Tibet**, an elevated plateau through which the upper Indus flows. It lies below the Kara-Korum Mountains and the Himalayas, with a mean elevation of 11,000 feet, and contains the nameless peak marked K², 28,278 feet high, next to Everest, the highest on the globe. It is politically a part of Kashmir, and the inhabitants are of Mongolian stock.

Baluchi, ba-loo'chē, the language of Baluchistan, one of the Iranian group of languages. There are two dialects, the North Baluchi, and the South Baluchi, or Maprani; the latter shows more ancient features. The literature is not important, though recently collections have been made of popular songs and legendary stories.

Baluchistan, bā-loo'che-stan', a country in the south of Asia, lying between Persia and the valley of the Indus, having the former on the west, Afghanistan on the north, Scinde on the east, and the Arabian Sea on the south; area, about 134,000 square miles. It is wholly under British influence and partly under British rule, while the Khan of Kelat is ruler of a considerable portion, and certain tribes are independent. The general surface of Baluchistan is rugged and mountainous, with some extensive intervals of barren sandy deserts. In the case of the principal ranges, the general parallelism and uniformity of their formation are somewhat remarkable, one system having an inclination from north to south, another from east to west. Many of these mountains are of great height and are covered with snow. There are several broad and high table-lands, extremely cold in winter and extremely hot in summer. Mekran in the south, the ancient Gedrosia, is one of the hottest regions of the globe. Some of the mountain chains are of compact limestone, enclosing marine shells and corals identical with similar objects picked up on the sea-shores at

this day. Excepting fragments of quartz found in Lus, primary formations have not been observed in any part of the Baluchistan Mountains. The mineral wealth of the country is believed to be considerable, including gold, silver, lead, iron, copper, many kinds of mineral salts, and saltpetre. Throughout Baluchistan there is a great deficiency of water, particularly in summer. In the northeast part are the rivers Bolan and Mula, the courses of which form the celebrated passes bearing their names, leading from the valley of the Indus to Baluchistan and Afghanistan. The soil is not in general fertile, but by patient industry the plains and valleys can be made productive in wheat, barley, and millet. The other chief crops are madder, cotton, particularly in Cutch Gundava, rice, indigo, and tobacco. Vegetables are abundant, and excellent fruits are produced in the gardens and orchards in the neighborhood of the towns. Fine camels are bred in large numbers.

The inhabitants are divided into two great branches, the Baluchis and the Brahuis, different in their languages, figures, and manners, and each subdivided into a number of minor tribes. The Brahuis have greater physical strength than the Baluchis, and are less addicted to predatory violence. Both races are hospitable, brave, and capable of enduring much fatigue. Many of them live in rude tents made of black felt or coarse cloth of goat's or camel's hair stretched over a frame of wickerwork. Both Baluchis and Brahuis are very ignorant but zealous Mohammedans. The Baluchi language resembles the modern Persian, the Brahui presents many points of agreement with the Hindu. The manufactures are mostly confined to coarse fabrics and a few matchlocks and other weapons, and the trade is unimportant. The khan, so far as his rule extends, has unlimited power over life, person, and property. He usually resides at Kelat, and his rule is almost confined to the country around it. Quetta is the largest town. It is occupied by a British garrison and strongly fortified.

About the middle of the 18th century Baluchistan was made tributary by Nadir Shah, who bestowed it, with the title of *beglerbeg*, or commander-in-chief, on Nasir Khan, who proved himself the ablest ruler that ever governed the country. On his death in 1795 he left the country in a comparatively prosperous condition, but it has since suffered greatly from intestine wars, and its boundaries have been curtailed. During the Afghan war in 1839 a British force was detached to assault Kelat, which was taken by storm after a siege of a few hours, 13 November the same year. The British again occupied it in 1840, but in the following year they left the country. Latterly a British protectorate over the whole of Baluchistan has been established, and the town of Quetta (which is now reached by railway from India) and a part of the country have been absolutely annexed. The khan receives an annual subsidy from India. The population is estimated at about 800,000.

Balucki, ba-loots'ke, **Michael**, Polish author, known under the pseudonym ELIPIDON: b. Cracow, 29 Sept. 1837. He is most popular as a story-teller of satirical tendency, ridiculing the shortcomings and prejudices of Polish society. Of his novels may be mentioned 'The Awakened' (1864); 'The Old and the Young'

BALUSTER—BALZAC

(1866); 'Life Among Ruins' (1870); 'The Jewess' (1871); 'For Sins Not Committed' (1879); '250,000' (1883). The best among his comedies are: 'The Chase After a Man' (1869); 'The Emancipated' (1873); 'Amateur Theatre' (1879); 'The Open House' (1883). He also wrote lyric poetry and essays on Polish literature.

Bal'uster, or Ballister, a kind of short column, sometimes in the form of an ancient bow, sometimes made after the model of Greek and Roman columns, employed in the construction of balustrades.

Balustrade, a series of balusters surmounted by a rail, and placed as an ornament on large buildings, above the cornice, or as a protection to enclose bridges, stairs, balconies, altars, and the like.

Baluze, bā-lüz, Etienne, French scholar and historian: b. Tulle, 24 Dec. 1630; d. Paris, 28 July 1718. He early acquired distinction by his varied and thorough knowledge, and was called to Paris by the celebrated Colbert, who commissioned him to make up his private library. In 1707 he was appointed to the superintendence of the royal college, and dismissed from that office in 1709, being suspected of having, in his 'Histoire Généalogique de la Maison d' Auvergne,' designedly established, by documentary evidence, that the princes of Bouillon were descended from the ancient dukes of Guienne, counts of Auvergne, and therefore owed no allegiance to the king of France. Such an offense could not be forgiven; and Baluze, deprived of nearly all his income, was compelled to reside successively at Rouen, Blois, Tours, and Orléans, and not until after the conclusion of the Peace of Utrecht was he permitted to return to Paris. He was of the most amiable temper, and his wit was equal to his cheerfulness.

Balzac, bāl-zāk, Honoré de, French novelist: b. Tours 20 May 1799; d. 18 Aug. 1850. His father had, under the old régime, been secretary to the grand council in the reign of Louis XV. Young Balzac was educated at the College of Vendôme, and afterward at a school kept by a M. Lepitre. He was subsequently placed in a notary's office; but the bent of his genius soon showed itself, and he began to contribute articles to the journals and to write romances. Before completing his 24th year he had published, under various *noms de plume*, 'The Two Hectors,' 'The Centenarian,' 'The Vicar of Ardennes,' 'Charles Pointel,' 'The Tartar, or the Return of the Exile,' and 'Clotilde of Lusignan.' Various other books followed, but the success attending all was very indifferent, and it was not till 1829, by the publication of 'The Last of the Chouans,' a tale of La Vendée, and the first novel to which Balzac appended his name, that the attention of the public was directed to the extraordinary genius of the author. A still greater popularity attended his 'Physiology of Marriage,' a work full of piquant and caustic observations on human nature. A titanic work was then projected by him, which, under the title of 'The Human Comedy,' should embrace a series of compositions corresponding to its title and portrayed the different peculiarities and follies of human nature. The execution of this scheme was zeal-

ously and elaborately proceeded with, and extending over 20 years, was only brought to a close by death.

In attempting to carry out this impossible design, he produced what is almost in itself a literature. The stories composing the 'Human Comedy' are classified as 'Scenes of Private Life,' 'of Parisian Life,' 'of Political Life,' 'of Military Life,' etc. They are connected by a web of intrigue which has the Paris of the Restoration for its centre, but which stretches its threads over the provinces. Each of the actors in the brilliant crowded drama is minutely described and clothed with individuality, while the scenes in which they move are set forth with a picturesqueness and verisimilitude hardly to be matched in fiction. Among the masterpieces which form part of Balzac's vast scheme may be mentioned 'Lost Illusions'; 'The Peasants'; 'The Woman of Thirty'; 'Poor Relations'; 'The Quest of the Absolute,' and 'Eugénie Grandet.' The 'Droll Stories' (1833) stand by themselves. They are a series of gross stories in the vein of Rabelais, Balzac reproducing with masterly skill the French of the 16th century.

Balzac's industry was phenomenal. He represents himself as working regularly for 15 and even 18 hours a day. He wrote 85 novels in 20 years, and he was not a ready writer, being very fastidious in regard to style, and often expending more labor on his proof-sheets than he had given to his manuscript. His work did not bring him wealth; his yearly income, even when he was at the height of his fame, is said to have rarely exceeded 12,000 francs. During his later years he lived principally in his villa, Les Jardies, at Sèvres. In 1849, when his health had broken down, he traveled to Poland to visit Madame Hanska, a rich Polish lady with whom he had corresponded for more than 15 years. In 1850 she became his wife, and three months after the marriage Balzac died in Paris.

His influence on literature has been deep and many-sided, and novelists with so little in common as Feuillet and Zola alike claim him for their master. He studied character and the machinery of society in a scientific spirit, but he was not content with the photographic reproduction of fact. He was a visionary as well as an analyst, an idealist and a realist in one. The materials acquired by study were shaped and colored by his fiery and teeming imagination. In the 'Human Comedy' we see the everyday world reflected in a magic mirror where the lights are brighter, the shadows darker; where objects stand out in sharper relief and are sometimes oddly distorted. He strenuously exaggerates in the delineation of character. "Every one in Balzac," says Baudelaire, "down to the very scullions, has genius." His work bears trace of the strain with which it was produced; it is often coarse, often extravagant, occasionally dull. But few writers give such an impression of intellectual force, and in the power of investing his creations with apparent reality he stands first among novelists.

The definitive edition of his works was published in 25 volumes (1869-75); the last contains his correspondence 1819-50 (English translation, with memoir, 2 vols. 1879). A complete translation was made by Miss K. P. Wormley (1889-94) and another edition (1899) has been published in Philadelphia.

HONORÉ DE BALZAC.

BALZAC—BAMBOO

Bibliography.—Lovenjoul, 'Histoire des œuvres de H. de Balzac'; Saltus, 'Balzac'; Wells, 'Century of French Fiction.'

Balzac, Jean Louis Guez de, French essayist and letter writer: b. Angoulême, 1797; d. 18 Feb. 1854. Under Richelieu he became royal counselor, and historiographer of France, and was one of the most influential members of the Academy from its foundation, likewise a sort of oracle of the Hôtel Rambouillet. His influence on French prose is ranked with that of Malherbe on poetry. Besides his 'Letters' (1624), which are elaborate epistles with a definite attempt at style, he wrote 'The Prince' (1631), a glorification of absolute monarchy; 'The Dotard' (1648); 'The Christian Socrates' (1652); and 'Aristippus' (1658), the latter intended to portray the ideal statesman.

Balzico, bāl-tsē'kō, Alfonso, Italian sculptor: b. 1825. He was educated at the Academy of Naples, and in Rome. Among his works are: 'John the Baptist'; 'Cleopatra'; 'The Free'; 'Vincenzo Bellini'; 'Duke Ferdinand of Genoa'; and 'Victor Emmanuel.'

Bambarra, bam-bar'ra, a negro kingdom of western Africa, lying at the point where 5° W. lon. and 12° N. lat. cross. It was first visited by Mungo Park. In the east the country is flat and swampy; but in the west there are low chains of granite hills. The climate in some parts is intensely hot, but is generally healthy. The land is well watered and fertile. The rainy season is from June to November. Cotton, maize, and yams are raised. The inhabitants, a branch of the Mandingoes, number about 2,000,000 and are superior to their neighbors in intelligence. The principal towns are Sego, Sansandin, Yamina, and Bammako. Many local merchants are very wealthy, and a quite extensive trade is carried on, the natives working articles in gold, ivory, and iron. In 1881 a treaty with the sultan of Sego opened up the country to French traders.

Bamberg, bām'bērg, a town of Bavaria, in Upper Franconia, on the navigable Regnitz (which here divides into two), three miles above its junction with the Main, partly on a plain, partly on hills, amid vineyards and gardens. Its chief edifice is the Roman Catholic Cathedral, built in the 12th century, and forming one of the finest examples of the transition from the Romanesque to the Gothic style, with four towers, a noteworthy portal, and interesting sculptures and monuments. Other buildings include the old palace or residence; another palace, formerly occupied by King Otto of Greece; the former castle of the prince-bishops of Bamberg, etc. The educational institutions include a college or lyceum, an old and a new gymnasium, a Roman Catholic seminary, an observatory, etc. There is a library containing 300,000 volumes, with valuable MMS. and early printed books. There are manufactures of cotton and woollens, besides other industries, such as market-gardening and seed-growing, brewing, etc. The United States is represented by a resident consul. Pop. (1902) 42,300.

Bamberger, bām'bērg-ēr, Heinrich von, Austrian pathologist: b. Prague, 1822; d. 1888. He was graduated in medicine in 1847, and became professor of special pathology and therapeutics, first in the University of Würzburg, and in 1872 in the University of Vienna. Of

his numerous publications, two have been held in particularly high esteem, 'On the Diseases of the Chylopoietic System' (1855), and 'Treatise on Diseases of the Heart' (1857).

Bamberger, Ludwig, German statesman: b. Mainz, 1823; d. 1899. He was educated at Giessen, Heidelberg, and Göttingen; took part in the revolution of 1849; and was a member of the German Reichstag 1873-80. He was an advocate of free trade, and on account of his opposition to Bismarck's economic policy, he left the National Liberal party and joined the "Secessionists," a group which later became part of the German Liberal party. His publications include 'Monsieur de Bismarck' (of which there is an English translation); 'The Five Millions'; 'Germany and Socialism'; etc.

Bambino, bām-bē'nō, the figure of our Saviour represented as an infant in swaddling clothes. The 'Santissimo Bambino' in the Church of Ara Cœli at Rome, a richly decorated figure carved in wood, is specially venerated, and is often the object of impressive religious demonstrations.

Bambocciades, bām-bōch-ī-ādz', paintings generally grotesque, of common, rustic, or low life. The name is derived from the nickname of Peter Van Laer, a Dutch painter of the 17th century, who, on account of his deformity, was called *bamboccio* (cripple). Teniers is the great master of this style.

Bamboo, the common name of more than 200 species of about 20 genera of perennial, mostly tree-like, tropical and sub-tropical grasses unevenly distributed throughout the world, but most abundant in southern Asia, where 160 or more species are found from sea-level to altitudes of 10,000 feet or slightly more in the Himalayas; and next most plentiful in America, where there are about 70 species, some of which reach elevations of 15,000 feet in the Andes. Occasional specimens of the larger species attain a height of 120 feet and a girth of 3 feet. From the jointed root-stock the numerous jointed, usually straight and erect, but sometimes crooked or creeping stems grow without branches until the full height is reached, when a more or less dense thicket of horizontal limbs is developed, and the great panicles of flowers appear.

The number of uses to which these plants are put rivals that of the palms. In fact the various species can be utilized for man's every purpose. The light, elastic hard stems, hollow or slightly pithy, except at the joints, which are strong partitions, are used for bridges, masts, poles, joists, fishing-rods, etc.; when the partitions are removed, for waterpipes; when sawed in sections, for pails (the natural partitions serving as bottoms), cooking-utensils, life-preservers, bows, arrows, quivers, walking-canes, flutes, and smoking-pipes; when split, for nets, hats, fishing-rods, wicker-work, and umbrellas. Parts of the leaves of some species are used for paper-making, thatch, and hats; the young shoots of some are used as food, either boiled or pickled; the seeds, for food and for making a kind of beer; some of the spiny species are planted as hedges for defense against foes, animal and human.

Some species yield "Indian honey" (so called by the Greeks), the air-dried saccharine exudations from the nodes. Sometimes this sub-

BAMBOO RAT—BANANA

stance is called *tabaris* or *tabasheer* (q.v.), which is properly a phosphorescent substance obtained from other species and from related grasses. Many of the species are of exceedingly rapid growth; even in greenhouses specimens have been known to attain a height of 20 feet in two months or even less time. In arid climates the bamboos are often of great value, since they are among the few plants that will grow in such places. Many species are cultivated for ornament, not only in warm countries, but in greenhouses. Some species are hardy in climates where the thermometer does not fall much below the freezing-point. In general the hardy species do best in deep, rich soil, and warm situations protected from severe winter winds. The roots should be given a protective mulch of litter in autumn, and this should be allowed to remain during the summer as a moisture conserver. For an account of ornamental bamboo culture in greenhouse and out of doors, and of the ornamental species grown in America, consult Bailey & Miller, 'Cyclopedia of American Horticulture.'

Bamboo Rat, a name given to several species of mole-rats, of the genus *Rhizomys*, found in the bamboo jungles of India.

Bamborough (bām'būr-ō) **Castle**, an ancient English castle on the coast of Northumberland, formerly with its connected estate the property of the Forsters, and forfeited to the Crown in 1715, both being purchased by Lord Crewe, Bishop of Durham, and bequeathed by him for charitable purposes.

Bam'bouk, or **Bambuk**, a region in west Africa, in the French colony of Senegal, between the Falémé and Senegal rivers, between lat. 12° 30' and 14° 30' N; lon. 10° 30' to 12° 15' W., and estimated to be about 140 miles in length by 80 to 100 in breadth. Besides the Senegal, its tributaries, the Falémé and the Bafing (or Upper Senegal), form its natural boundaries. A considerable part is somewhat rugged, though not very elevated, the highest points seldom exceeding 600 feet. The valleys and plains are remarkably fertile. The baobab, calabash, tamarind, with a variety of acacias and palms, reach the utmost limit of their fruitfulness; maize, millet, cotton, and a multitude of leguminous plants grow almost without culture, and rice is produced in the lowlands, which are subject to inundation. Its unhealthiness, however, makes it almost uninhabitable by Europeans. The animals comprise lions and elephants, wild cattle, crocodiles, etc. Gold is found in abundance. It is carelessly worked, and is given to traders in exchange for salt, an article in great demand, and various other goods. Bam'bouk is more sparsely inhabited than formerly. The natives are Mandingoes and form a considerable number of communities or confederations more or less hostile to each other. The country has latterly been fully explored by the French, who are developing its resources and have constructed a railway along the Senegal from Kayes to Bafulabé. In the 15th century the Portuguese, allured by the fame of its gold, invaded Bam'bouk, but ultimately perished almost to a man, partly through intestine dissensions and debauchery, and partly by the weapons of the natives.

Bamian, bā-me-ān', a valley and pass of Afghanistan, the latter at an elevation of 8,496

feet, the only known pass over the Hindu Kush for artillery and heavy transport. The valley is one of the chief centres of Buddhist worship and contains two remarkable colossal statues and other ancient monuments.

Bammako, bā-mā'kō. See **BAMBARRA**.

Bampton Lectures, a course of lectures established by John Bampton, canon of Salisbury, who bequeathed certain property to the University of Oxford for the endowment of eight annual divinity lectures to be annually delivered. The subjects prescribed are, the Confirmation of the Christian faith and the confutation of all heretics and schismatics; The divine authority of the Scriptures; The authority of the primitive Fathers in matters of Christian faith and practice; The divinity of Christ; The divinity of the Holy Ghost; The Apostles' and Nicene creeds. The lecturer must have taken the degree of M.A. at Oxford or Cambridge, and the same person may not lecture twice. The first course of lectures was delivered in 1780, and they have been delivered every year since, with the exceptions of 1834, 1835, and 1841. A list of the lectures will be found in the yearly 'Historical Register of the University of Oxford.'

Ban, the title of the governors of certain military districts in the eastern part of Hungary, corresponding to the German title of margrave. The ban is nominated by the king, renders an oath to the Diet, and formerly had very extensive powers, exercising an almost absolute authority in the political, judicial, and military affairs of his district. The progress of Turkish conquest after the unfortunate battle of Mohacs in the 16th century extinguished the most of the banats, and there remains now only the banat of Temesvar, the ban of which is the third great dignitary of the Hungarian kingdom and has the title of ban of Croatia.

In Teutonic history the ban was an edict of interdiction or proscription; thus, to put a prince under the ban of the empire was to divest him of his dignities and to interdict all intercourse and all offices of humanity with the offender. Sometimes whole cities have been put under the ban; that is, deprived of their rights and privileges.

Bana, bā'na, in Hindu mythology, a thousand-armed demon or giant who was the enemy of Vishnu, but the friend of Siva.

Ban'ak, or **Ban'nock**, an Indian tribe of Idaho. Its territory formerly extended over southern Idaho and eastern Oregon; but the tribe is now concentrated on the Fort Hall and Lemhi reservations, Idaho. Those of the latter reservation are confederated with the Shoshoni.

Banana, ba-na'na, an island in west Africa, north of the mouth of the Kongo; also a seaport of the Kongo Free State, situated on the island. A few years ago the town was an important commercial station, but after the building of the railroad from Matadi, and the establishment of an ocean steamship line direct to that place, Banana began to decline, and, at last lost all its trading importance when the extensive Dutch firms formerly established there removed their headquarters to Kabinda and Kisanga, in Portuguese territory.

Banana (*Musa sapientum*), a tropical herb of the natural order *Scitamineæ*, apparently native of India, but unknown in a wild state;

BAMBOO GROVE IN JAVA.

BANANA-BIRDS — BANCROFT

valued somewhat for its fibre and decorative appearance, but mostly on account of its fruit, for which it is widely cultivated in warm climates. For a large part of the human race it ranks as high as cereal grains among northern peoples. Though considered less nutritious than an equal weight of potatoes, the banana is said to produce more food upon a given area and to be capable of sustaining a larger number of persons than wheat. From its perennial rootstocks suckers are thrown up to a height of from 8 to 40 feet or more. They bear a whorl of paddle-like leaves, from among the bases of which, in about two years, a large heart-shaped scaly bud appears. As the bud grows it becomes pendant, the scales separate and disclose groups of upward-pointing flowers sometimes to the number of 150. The fruit is gathered while still green, the stem being cut at the same time. Of the suckers that quickly appear, one, two, or three are allowed to remain for the succeeding crop. When once established the plants should bear a bunch every year. Since the plants rarely or never bear seeds, suckers are usually relied upon for propagation. Propagation by means of root-cuttings is a more rapid means of multiplying the number of plants, but is used only when large numbers are desired. The plants are set in the field 8 to 12 feet apart when two or three feet high; when full grown they completely shade the ground. Since 1870, when only a few hundred bunches were imported into the United States, the banana has become increasingly popular: in 1899 \$5,600,000 worth was imported, mainly from the West Indies and Central America. California, Florida, and Louisiana produce a small quantity, but these States cannot be expected to compete with warmer climates. Banana flour, produced in the tropics from ripe bananas, is growing in popularity wherever introduced, and dried bananas seem to promise an outlet for excessively heavy crops. The botanical name, *Musa sapientum*, which means "of the wise muse," alludes to Theophrastus' statement that the wise men of India used a certain fruit for food, which seems to have been the banana or the plantain.

Banana-birds, any of several small West Indian insect, and honey-eating birds that frequent the banana groves, especially the bananaquit (*Certhiola flaveola*) of Jamaica, whose pretty ways are described at length by Gosse in his books on the natural history of that island. One species (*C. bahamensis*) occasionally visits Florida. All these birds are brilliantly plumaged, usually rich blue with yellow markings, and represent the sun-birds (q.v.) of the Eastern tropics.

Banana-fish. See LADY-FISH.

Bananal, bá-na-näl', also called SANTA ANNA, an island in Brazil, formed by the River Araguaya, in the province of Goyaz. Its length is 200 miles; breadth 35 miles. It is covered with dense forests, and has in its middle an extensive lake. Soil, fertile. Also the name of several small villages in Brazil.

Banas, ba-näs', a common name for rivers in India. The most important are: (1) a river of Shutia Nagpur, Bengal, having a north-west course of about 70 miles, and falling into the Sone, near Rampur; (2) a river which rises in the Aravulli Mountains, and, after a southwest course of 180 miles, is lost in the

Runn of Cutch; (3) a river of Rajputana, also rising in the Aravulli Mountains, flowing north-east through Mewar for 120 miles, then south-east, and falling into the Chambal, after a total course of 300 miles.

Ban'at, a term applied to any district ruled by a ban (q.v.). Specifically a large and fertile region in Hungary, consisting of the counties of Temesvar, Torontal, and Krisso; principal town, Temesvar. The region originally belonged to Hungary; was occupied by the Turks in 1652-1716; and was reunited to Hungary in 1779. The population exceeds 1,500,000.

Ban'bridge, Ireland, a market town in County Down, 22 miles southwest of Belfast, situated on the Bann. It has an Episcopal church in the Gothic style, and several other churches. The principal manufacture is that of linen, which is carried on to a great extent. Pop. (1901) 5,376.

Ban'bury, England, a municipal borough and market town of Oxfordshire, on the Oxford Canal, 23 miles north of Oxford, and 78 northwest of London by rail. Its strong castle, built about 1125, was demolished during the Great Rebellion, when Banbury was noted for Puritanical zeal. In 1469 the Yorkists were defeated in the vicinity. The town is still famous for its cakes and ale, as in Ben Jonson's day; and it manufactures webbing and agricultural implements. Among the buildings are the parish church (1797) and the town hall (1854). Pop. (1901) 12,967.

Banc (Lat. *Bancus*, Ger. Bank, a bench), legally a seat or bench of justice, and in this sense has given rise to the expression in courts of common law, "sitting in banc," or *in banco* — that is, sitting together on the bench of the respective courts.

Banca, ban'ka, **Banka**, or **Bangka**, an island of the Malay Archipelago, belonging to the Netherlands, between Sumatra and Borneo; area, 5,000 square miles. It possesses several considerable bays and is hilly. It is celebrated for its excellent tin, obtained in black alluvium in the north end of the island, about 25 feet below the surface, and of which the annual yield is about 4,000 tons. Banca likewise yields iron, copper, lead, timber, sago, nutmegs, benzoin, etc. The population is about 100,000, of which a large proportion are Chinese.

Banca, a boat used in the Philippines, made from a single log and furnished with an out-rigger.

Ban'co, a term designating the money in which the banks of some countries keep or kept their accounts in contradistinction to the current money of the place, which might vary in value or consist of light and foreign coins. The term was applied to the Hamburg bank accounts before the adoption (in 1873) of the new German coinage. The mark banco had a value of 35-43 cents; but there was no corresponding coin.

Bancroft, Aaron, Unitarian clergyman: b. Reading, Mass., 10 Nov. 1755; d. 19 Aug. 1839. He was graduated at Harvard in 1778; became pastor in Worcester in 1785, where he remained nearly 50 years. Besides a great number of sermons, his works include a 'Life of George Washington' (1807). He was the father of the historian, George Bancroft.

BANCROFT

Bancroft, Cecil Franklin Patch, educator: b. New Ipswich, N. H., 25 Nov. 1839. He graduated from Dartmouth in 1860; at Andover Theological Seminary in 1867; and at the University of Halle, Germany. He was ordained to the Congregational ministry in 1867, but has never held a pastorate. In 1873 he was made principal of Phillips Academy, Andover, Mass., and since then has sent more boys to colleges and scientific schools than any other American secondary school teacher. He has frequently contributed religious and educational articles to periodicals.

Bancroft, Edward, American physician: b. Westfield, Mass., 9 Jan. 1744; d. 8 Sept. 1820. Early in life he ran away from home; became a practising physician in Guiana; and passed the latter part of his life in England. During the Revolutionary war he is believed to have been a spy for the British. His publications include a 'Natural History of Guiana' (1769) and 'Researches Concerning the Philosophy of Permanent Colors' (2 vols. 1794-1813).

Bancroft, George, American historian: b. Worcester, Mass., 3 Oct. 1800; d. Washington, D. C., 17 Jan. 1891. He was the son of Rev. Aaron Bancroft (q.v.), a Unitarian clergyman, and Lucretia Chandler Bancroft. He fitted for college at Phillips Academy, Exeter, N. H., entered Harvard College at the age of 13, and was graduated before reaching his 17th birthday. Edward Everett, then professor of Greek, having proposed that some young graduate of promise be sent to Germany for purposes of study in order that he might afterward become one of the corps of instructors, Bancroft was chosen, and in the summer of 1818 went to Göttingen, where two years later he received his degree of Ph.D. At Göttingen he studied German literature under Benecke; Italian and French literature under Artaud and Bunsen; Oriental languages and New Testament Greek under Eichhorn; natural history under Blumenbach; and the antiquities and literature of Greece and Rome under Dissen, an enthusiastic admirer of Plato, with whom he went through a thorough course of Greek philosophy. But his chief attention was given to history, which he studied under Heeren, the greatest historical critic of that day, and one of the most scientific of all historians. In choosing this special branch, Bancroft gave as a reason his desire to see if facts would not clear up theories and assist in getting out the true one. For a time he also studied at Berlin, where he was warmly received by the leaders in the academic world, notably, Wolf, the editor of Homer; Schleiermacher, and Hegel, to whom he brought tidings of their fame in the New World. In an extended tour through Germany and other countries he met Goethe at Jena, studied for a time with Schlosser at Heidelberg, formed an acquaintance with Manzoni at Milan and a life friendship with Chevalier Bunsen at Rome, where he also met Niebuhr. At Paris he was kindly received by Cousin, Benjamin Constant, and Alexander von Humboldt. Returning to America in 1822 he served for a year as tutor in Greek at Harvard. In 1823, in conjunction with J. G. Cogswell, he established the famous Round Hill School at Northampton, Mass., a preparatory school far in advance of its time as to systems of study and class-books. The teachers were

good, the instruction inspiring, and the students led a happy, healthy life, but the undertaking proved a failure financially. Bancroft withdrew in 1830, and Cogswell two years later. Many of their students afterward became men of national reputation or prominence, among them being J. L. Motley, Ellery Channing, G. E. Ellis, and Theodore Sedgwick. Henceforward his career is best separated into political and literary. During the Round Hill years he had cut loose from the political traditions of the Harvard circle. In a public speech in 1826 he had avowed his principles to be for universal suffrage and uncompromising democracy, and at once became foremost in the councils of the Democratic party, though twice declining nomination or election to the State legislature. Van Buren appointed him collector of the port of Boston (1838-41), and his administration of the office won the praise of his political opponents. While collector he appointed Nathaniel Hawthorne and Orestes Brownson to offices within his jurisdiction. In 1844 he was defeated as the Democratic candidate for governor of Massachusetts, although he received more votes than any previous candidate of his party. In 1845 he became secretary of the navy under Polk. It was he who planned and established the Naval Academy at Annapolis, Md.; he gave the first order to take possession of California; and while acting secretary of war ordered Gen. Taylor to march into Texas, thus ultimately leading to the annexation of that State. During 1846-9 he was minister-plenipotentiary to Great Britain, and there successfully urged upon the British ministry the necessity of adopting more liberal navigation laws. His reputation as a man of letters put the manuscript treasures of the great English families at his disposal, and he combined his public duties with ardent historical researches. From 1849 to 1867 he lived in New York city, absorbed in literary work. During the Civil War he was a patriotic War Democrat, and delivered a powerful speech effectually demolishing the Constitutional plea for slavery. Before both Houses of Congress he delivered a masterly eulogy on Lincoln. Appointed minister to Prussia in 1867 he achieved a diplomatic triumph in bringing about the adoption of treaties in which England and Germany finally recognized the right of expatriation and abandoned their doctrine of "once a citizen, always a citizen." In the northwest boundary treaty, negotiated by Polk, there was an ambiguity concerning a portion of the line. It was decided to submit the point to the German emperor for arbitration. Bancroft prepared the whole American argument and the reply to the case of the British. The decision was unreservedly in favor of the United States.

His first publication was a volume of 'Poems' (1823), all European in theme. This was followed by books for the use of his students, translations of Heeren's 'Politics of Ancient Greece' (1824), and Jacobs' 'Latin Reader' (1825). His first article in the 'North American Review' appeared in October 1823, and was a notice of Schiller's 'Minor Poems' with numerous translations. Thenceforward he wrote in almost every volume, but always on classical or German themes, until in January 1831, he took up 'The Bank of the United States', and in October 1835 'The Documentary History of the American Revolution.' The two

GEORGE BANCROFT.

BANCROFT

latter indicate the direction his historical studies had taken. Then came the beginnings of his great 'History of the United States,' the work which gave him his greatest fame. The first volume appeared in 1834, the second in 1837, the third in 1840, the fourth in 1852, the fifth in 1853 and so onward to the tenth in 1874. The earlier volumes were received with enthusiasm in America, pirated in England, translated into Danish, Italian, German, and French, both with and without the author's permission. The 15th editions of Vols. I-III was issued in 1853. The design of the work was as deliberate as Gibbon's, and almost as vast, and, like Gibbon, Bancroft lived to see his work accomplished. The history of the United States from 1492 to 1789 is treated in three parts. The first deals with 'Colonial History, 1492-1748.' The second part, 'The American Revolution, 1748-82,' is divided into four epochs called respectively: 'Overthrow of the European Colonial System, 1748-63'; 'How Great Britain Estranged America, 1763-74'; 'America Declares Itself Independent, 1774-5'; and 'The Independence of America Acknowledged, 1776-82.' The last part, though published as a separate work, entitled 'History of the Formation of the Constitution, 1782-9,' is really a continuation of the 'History.' The work is still the most popular and widely read of the larger American histories. Bancroft's materials and facilities for writing it were better and more extensive than any other writer on our Anglo-American history has enjoyed. His private collection of manuscripts and documents, original and copies (now in the Lenox Library, New York), was by far the finest of his day in private hands, and superior to most institutional collections. His merits as a historian are positive and incontestable. For his subject he had a boundless and untiring enthusiasm, and he was permeated with that democratic spirit without which the history of the United States cannot be adequately written. Though his early style is justly open to the charge of being pompous, inflated, and over-ornamented, it is essentially picturesque, and the earlier defects were greatly remedied by his successive revisions of the work. His command of his resources was masterly, and a far from favorable critic candidly admits that "one must follow him minutely through the history of the war for independence to appreciate in full the consummate grasp of a mind which can deploy military events in a narrative as a general deploys brigades in a field. Add to this the capacity for occasional maxims in the highest degree profound and lucid, and you certainly combine in one man some of the greatest qualities of the historian." It has been said that he made no effort to avail himself of the materials and results of other investigators, but nowhere does he claim finality for his work, and his later years were chiefly occupied in weaving into his narrative what he and no one else had. In 1876 he issued a Centenary edition in six volumes, upon which he had spent a solid year in revision. Again in 1883-5 he published what he termed the "author's last revision" in six volumes large octavo. In this he made considerable changes in arrangement and the subdivisions, all tending to a better ordering of the narrative. There were frequent omissions and condensations, and many repetitions and redundancies were cast out. These final changes

have, in the judgment of good scholars, better fitted the work for permanent favor. It will remain necessary to the student until another historian, with equal or better facilities, shall rewrite the story in a way to gain wider sympathy. Present tendencies and methods in historical study and writing give little evidence that such another will soon arise. His lesser works include 'Poems' (1823); 'Literary and Historical Miscellanies' (1855); 'Memorial Address on the Life of Lincoln' (1866); 'Joseph Reed: a Historical Essay' (1867); 'A Plea for the Constitution of the United States Wounded in the House of Its Guardians' (1886); 'Necessity, Reality, and Promise of the Progress of the Human Race' (1854); 'Oration, 4 July 1826, Northampton, Mass.'; 'Oration Before the Democracy of Springfield, Mass., 4 July 1836'; 'Address at Hartford, Conn., 18 Feb. 1840'; 'History of the Formation of the Constitution of the United States' (1882); 'Oration Delivered at the Commemoration, in Washington, of the Death of Andrew Jackson, 27 June 1845.' To the American Encyclopædia he contributed the article on Jonathan Edwards. See Green, 'George Bancroft' (1891); Wallis, 'Mr. Bancroft as a Historian' (1896); West, 'George Bancroft' (1900).

Bancroft, Hubert Howe, American historian: b. Granville, Ohio, 5 May 1832. In 1852 he went to California to establish a book business, and began to collect documents, maps, books and MSS. for a complete 'History of the Pacific States' from Mexico to Alaska. In 1893 this library numbered 60,000 volumes, to which many additions have been made. His histories are still in preparation. 'Literary Industries' (Vol. XL, San Francisco, 1890) describes his work.

Bancroft, Marie Effie Wilton, English actress, wife of Sir Squire Bancroft (q.v.). She appeared on the stage when a child, and acted in several places before making her London debut. In London she won great popularity in several plays, particularly in 'The Maid and the Magpie' at the Strand. In 1865 she became a partner in the management of the Prince of Wales' Theatre, and obtained Squire Bancroft (afterward her husband) as leading man. Since then she has been associated with him as manager and actress.

Bancroft, Richard, English archbishop: b. Farnworth, Lancashire, 1544; d. 1610. He studied at Cambridge, entered the Church, and rose rapidly during the reign of Elizabeth till he obtained the see of London in 1597. After her death James I. made him archbishop of Canterbury on the death of Whitgift. He possessed good talents, and was distinguished as a controversialist, a preacher, and a politician. The greatest blot on his memory is the rigor with which he treated the Puritans.

Bancroft, Sir Squire, English actor: b. 1841. He began his career in Birmingham in 1861, and played at Dublin and Liverpool. In 1865 he made his first appearance at the Prince of Wales' Theatre, and continued there several years as leading man in a series of comedies depicting modern life, among which are: 'Society'; 'Caste'; 'Play'; 'School'; and 'M. P.' In 1880 he moved with his wife to the Haymarket Theatre, where he continued presenting the same line of plays. Since 1885 he has ap-

BANCROFT—BAND SAW BLADES

peared but little, though he took part in 'Diplomacy' at the Garrick Theatre in 1893.

Bancroft, Wilder Dwight, American chemist: b. 1867. He was educated at Harvard and abroad, and obtained the degree of Ph.D. at Leipsic. He was instructor of chemistry at Harvard 1894-5; was appointed assistant professor of chemistry at Cornell in 1895. In the same year he founded the 'Journal of Physical Chemistry' and became its editor.

Bancroft, William Amos, American railway president: b. Groton, Mass., 26 April 1865. He was graduated from Harvard University 1878, Harvard Law School 1881, and was admitted to the Suffolk bar 1881. He was elected mayor of Cambridge in 1893 and has occupied many positions of political importance. He is also director in many educational and financial institutions.

Band, in music, a number of trained musicians in a regiment, intended to march in front of the soldiers and play instruments, so as to enable them to keep step as they move forward; also any similarly organized company of musicians, though unconnected with the army; an orchestra. The word is also applied to the subdivisions of an orchestra, as string-band, wind-band, etc.

In architecture, any flat fascia or ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. Band of a shaft is the molding or suits of moldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.

As vestment, bands are linen pendants from the neck, forming part of clerical, legal, and academic costume. It is a moot question whether they are a survival of the amice, or immediate descendants of the wide falling collar which was a part of the ordinary civilian dress in the reign of James I. In the Anglican Church they are seldom worn, except by ultra-low Churchmen; but they are in common use with Presbyterian ministers (ordained ministers as distinguished from licentiates). Foreign Catholic ecclesiastics wear black bands with a narrow white border.

Band-fish, a genus in the family *Cepolidae*, having the body much elongated and compressed, and is covered by very small scales. The dorsal fin is very long, and consists like the anal of soft rays. The tail vertebræ are very numerous, and the whole structure of the body exhibits unusual delicacy, so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths, and are unable to contend with waves and currents. The snake-like form and the beauty of their colors make them objects of great interest. One species, the red band-fish (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about 15 inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of fire-flame and red ribbon, by which it is known at Nice. The home of the genus is in Japanese waters. See OAR-FISH.

Band of Hope Union, an association of the children's temperance societies of Great Britain, having upward of 15,000 allied associations, with a membership of 2,000,000.

Band Saw Blades. Owing to the increased value of timber in America more and more attention has been paid to the economical conversion thereof into the sawn product ready for market. The methods in use a few years ago were found to be wasteful and usually crude, and the product turned out of but an indifferent quality so far as sawing was concerned.

The attention of the operator being directed to band saw blades, these have come into quite general use for various purposes. A test of the band saw blade has proven its advantages to be so great that it has displaced not only the small scroll or "jig" saws for bracket sawing and ornamental scroll and curved work, but has also displaced reciprocating saws and circular saws for heavier work.

A band saw consists of a thin band or ribbon of steel with teeth cut in one edge, and when in use it is mounted on two wheels like a belt and made to travel at a rapid rate of speed by revolving the wheels. For scroll work its advantage over the reciprocating and jig saw lies mainly in the increased and uniform speed at which the saw blade travels which enables the operator to better control the work in hand and to feed the material toward the saw constantly, and thus to turn out more and better work than would be possible with a reciprocating saw cutting on the downward stroke only.

In sawing logs the advantage of a band saw as compared with a reciprocating saw may be judged when we state that the band saw blade travels at a rate of from 8,000 to 10,000 feet per minute, whereas, a reciprocating saw making 200 strokes of 18 inches to the minute, would only have a cutting speed of 300 feet per minute. The band saw traveling more than 20 times as fast as the reciprocating saw, will naturally perform nearly or quite as much work as 20 reciprocating saws. The single reciprocating saw, which evidently was the primitive saw mill, because of its limited capacity was succeeded by what is termed in the United States a gang, in Europe, a log frame, and in Canada a gate. The gang saw mill for log sawing consists of a sufficient number of reciprocating saws placed side by side in a frame to saw completely at the one operation an entire log. The advantage of the band log mill over the gang lies in its adaptability to the sawing of each log to the best advantage; as but one cut is made at a time, and as the face of the log is exposed to the view of the sawyer, he can judge through what portion of the log the next cut should be made to yield the best results.

Another form of saw mill is that known as the rotary mill or circular saw mill. Both the circular and band log mills are provided with traveling carriages on which the log is placed, secured and fed past the saw. The circular saw has possibly as great a capacity as the band, but it is very wasteful, because a circular saw large enough to saw plank from the side of a log of medium size needs to be of such large diameter that in order to support it in the cut the saw is made very thick, and thus removes an immense saw kerf. Not only this, but it has been found impossible to saw with this kind of mill with sufficient accuracy to meet the pres-

BANDA — BANDAGE

ent market requirements. The circular saw while popular in the past is known to have wasted nearly or quite 25 per cent of the product of the log in saw kerf and poorly sawn timber. The band saw, on the other hand, combines the accuracy of the reciprocating saw with the capacity of the circular saw. The success of the band saw is due: first, to the acquired skill of the saw maker in turning out saw blades of suitable temper to retain a good cutting edge and at the same time flexible enough to pass over the wheels without cracking; second, to the skill of the saw filer in fitting his saws. Band saws require to be "tensioned" from time to time when in use. By the word tension is meant the expanding of the central portion of the saw blade either by the use of a hammer and anvil or by the use of what is termed stretching rolls.

The use of the band saw has also brought forth an extensive line of saw fitting tools such as saw "swages" which are designed to expand the points of the teeth, "pressure side dressers" or "tooth formers" or "shapers" which are intended to give form to the swaged points of the teeth, automatic saw sharpeners, etc. With the use of these improved appliances it was found that thinner and thinner band saw blades could be used, and hence the band saw has come into general use for "resawing purposes," that is, the sawing of planks and boards into two or more thinner pieces. For this purpose it is well adapted. The plank or boards to be resawn are fed to the saw by means of rollers. Saws as thin as .02 of an inch in thickness are successfully used. Such saws remove a saw kerf of practically one thirty-secondth of an inch. The advantage of the band resaw lies in the fact that it is practical to use the thinnest and most delicate saw of this type and still have it of practical use and service as a tool.

EDWARD C. MERSHON,
Of W. B. Mershon & Company, Saginaw, Mich.

Ban'da, a town of India, in the northwest provinces, capital of a district of the same name, on an undulating plain near the Ken River, 95 miles southwest of Allahabad. It is a straggling, ill-built place, but with clean streets, and contains a large number of mosques and temples. It was formerly an important cotton market. There are cantonments about a mile distant from the town. Pop. (1900) 29,000.

Banda Islands, a group belonging to Holland, in the Indian Archipelago, south of Ceram; the largest, Great Banda, being 12 miles long by 2 broad, while Goenong Api is an active volcano nearly 8,000 feet high. They have a rich soil admirably adapted for the cultivation of the nutmeg, which is their chief product, others being coconuts and sago. The total area of the group is about 19 square miles and the capital of the group is Banda, the seat of the assistant resident. Tatti wood is grown on the island of Rosingen. Pop. about 8,000, of whom less than 600 are Europeans.

Banda Oriental, a state of South America, originally settled by Spaniards from Buenos Ayres, claimed by Brazil, but, after a war, made in 1825 into the independent State of Banda Oriental del Uruguay—that is Eastern Bank of the Uruguay, now usually called simply Uruguay (q.v.).

Vol. 2—20

Bandage, a surgical wrapper applied to some part of the body. Bandages are employed for a variety of purposes. One of their chief uses is to secure dressings or splints. Another is to give support to a limb or to restrain its movements, or to exert pressure upon it so as to aid in restraining bleeding at some point; or a bandage may be used to promote healing, as in the case of ulcers, or to aid in the removal of swelling. In these latter cases the bandage must be applied with a considerable degree of tightness, and great care must be exercised that it be evenly put on, and that the tightness with which it is drawn does not give rise to disturbances of the circulation by undue and irregular pressure. Suppose, for instance, the arm is being bandaged from the hand well up over the upper arm. The arteries which carry the blood down the limb are for the most part deeply seated and well protected by muscles, so that they are practically unaffected by any ordinary degree of pressure on the surface. But many of the veins which carry the blood back to the heart up the limb run immediately under the skin, and will be pressed upon considerably by a bandage applied round the arm. If the bandage is made too tight at the elbow, say, the veins will be compressed and the blood will flow less easily along them at that point than it does lower down where the pressure is less. The consequence will be that the blood will be hindered in passing up from the hand; and as blood is all the time being carried down to the hand in the arteries, which are unaffected, the veins in the forearm and hand will become swollen and gorged with blood. The pressure of blood in the veins will become so great that fluid will be pressed out of the finer vessels into the surrounding tissues, and the hand will become swollen, puffy, and dropsical, while much pain will be experienced. If the tight turns of the bandage are now loosened, the veins will again offer a free passage to the blood, and the swelling and pain will gradually subside. The proper method in such a case is not necessarily to bandage loosely, but to bandage uniformly, beginning with the requisite degree of tightness at the very extremity of the limb, and continuing evenly and regularly upward. A general rule in bandaging a limb, then, is: never let the bandage be tighter up the limb than it is at the extremity; apply it firmly and evenly at the extremity and carry it up uniformly. To this may be added, as a second rule, that if a bandage requires to be tightly applied in the course of a limb it must be begun at the extremity. It is specially necessary to follow these rules when the bandage is applied to secure a splint, since it must be tight enough to keep the splint in accurate position, or to keep a pad firmly applied over a wound for the arrest of bleeding. Bandages usually consist of strips of unbleached or bleached calico, linen, flannel, muslin, etc. Elastic bandages and india-rubber bandages are also in use for particular cases. The material should be torn into strips of the requisite breadth, and the bandages should have no hem or edging, as this would prevent them stretching equally in all directions. The strips should be rolled up for use into firm rollers, a roller bandage being usually 6 yards long, though often more. They are of different breadth, most commonly 2½ or 3½ inches. For the chest and abdomen the breadth should be 4½ inches; for

BANDAI-SAN — BANDICOOT

the fingers three-quarters of an inch. The triangular bandage is of all others the one made use of for rendering temporary aid in cases of accident, and, through the training afforded by "first aid to the injured" associations, is now familiar to almost everyone. The bandage is made of a square yard of linen or calico halved diagonally, each half having of course two sides 36 inches each in length, with a base of fully 50 inches. When it is desired to exert very considerable pressure upon a part for a length of time, or when it is desired to keep a limb or a joint motionless for some time, this may be done without the use of splints by stiffening the bandage with starch or plaster of Paris.

Bandai-San, bân'di-sân', Japan, a volcano on the island of Nippon, 140 miles north of Tokio. Its summit consists of several peaks, the highest of which is 6,035 feet above the ocean and 4,000 feet above the surrounding plain. On 15 July 1888 there was a terrible explosion of steam which blew out a side of the mountain, making a crater more than a mile in width, and having precipitous walls on three sides. The debris of broken rock and dust poured down the slope and over an area of 27 square miles, killing 461 persons and covering a number of villages.

Bandajan', a pass over a range of the Himalayas, in Cashmere, 14,854 feet above sea-level.

Bandan'a, a cotton handkerchief, having a dark ground of Turkey-red, blue, or purple, variegated with simple patterns of white or bright yellow, their bright colors making them a favorite head-covering for southern negro women. These handkerchiefs were originally manufactured in the East Indies; but the beauty and durability of their colors caused such a demand that the manufacture of them was established elsewhere. The process is first to dye the cloth of a dark color, commonly Turkey-red, which serves as a ground. The white spots constituting the pattern are afterward produced by discharging the color with a solution of chlorine. In order to confine the discharging fluid to the exact points to be operated upon, the pattern is cut out in leaden plates, upon which the fluid will not act, and as many handkerchiefs or pieces of cloth as are to be operated upon are enclosed between pairs of these patterns, and subjected to enormous pressure, the discharging fluid being run in at the top and prevented by the pressure from spreading, so that the pattern is brought out clean on the spots subjected to the action of the fluid.

Bande Noire, bând nwâr, an appellation given during the French Revolution to companies of capitalists and speculators who bought up the forfeited estates of the Church and nobility. They were considered by many as hordes of Vandals bound to destroy the monuments which kings, nobles, and religious orders had erected all over France; and thence the scornful denomination, which was continued nearly up to 1830. But while the Bande Noire removed some castles and monasteries which ought to have been preserved as relics of art and religion, they did much toward the prosperity of the country by improving unproductive lands and disseminating among the people landed property which previously was concentrated in the hands of privileged classes. The term was

originally applied to a body of German soldiers who were employed in the Italian wars by Louis XII. of France, and who received the name from carrying black colors after the death of a favorite commander. The appellation was also assumed for the same cause by different Italian and French troops in the 16th century.

Ban'ded Peak, or **Mt. Hesperus**, a summit of the San Juan Mountains, in southern Colorado; altitude, 12,860 feet.

Bandel, bân'dêl, **Ernst von**, Bavarian sculptor: b. Ansbach, 1800; d. near Donaworth, 25 Sept. 1876. He studied art at Munich, Nuremberg, and Rome; and from 1834 lived chiefly at Hanover, engaged off and on, for 40 years, on his great monument of Arminius, near Detmold, 90 feet high, which was unveiled by the Emperor Wilhelm 16 Aug. 1875.

Bandelier, bân-dê-lêr, **Adolph Francis Alphonse**, Swiss-American archæologist: b. Berne, 6 Aug. 1840; settled early in the United States, where he has done important work under the direction of the Archæological Institute of America. His studies have been chiefly among the Indians of New Mexico and Arizona, Central America, and Mexico. He has published many papers on the subject. He is also the author of 'Art of War and Mode of Warfare' (1877); 'Social Organization and Government of Ancient Mexicans' (1878); 'Tenure of Lands and Inheritances of Ancient Mexicans' (1878); 'An Archæological Tour into Mexico' (1885); a novel of Pueblo Indian life, 'The Delight Makers'; etc.

Bandello, bân-dêl'ô, **Matteo**, Italian novelist: b. about 1480; d. 1561. He studied at Rome and Naples and applied himself almost exclusively to polite literature. In his youth, he was a Dominican monk, and was entrusted with the education of the celebrated Lucrezia Gonzaga. After the battle of Pavia he was banished from Italy as a partisan of the French, and Henry II. of France gave him in 1550 the bishopric of Agen. He left the administration of his diocese to the Bishop of Grasse, and employed himself, at the advanced age of 70, in the completion of his novels, of which he published three volumes in 1554; a fourth was published in 1573, after his death, which took place in 1561. He also published some poems. His novels are in the style of Boccaccio and are characterized by even greater license.

Ban'deras, **Rio de**, a river of Mexico, on the east coast; so called (river of flags) because, when discovered in 1518 by Juan de Grijalva, the natives waved white flags at the end of their spears in token of friendship.

Bandettini, bân-dêt-tê-nê, **Teresa**, Italian poet: b. Lucca, 12 Aug. 1763; d. 1837. Beginning life as a danseuse, she discovered her poetic talent as if by accident, and came to be known and honored in most parts of her country. She was especially gifted in improvising verse. She was called the Amarilla Etrusca. Of her finished poems there remain 'La Morte de Adanoide'; 'Il Polidoro'; 'La Rosmunda'; and some shorter pieces.

Ban'dicoot. 1. A large dark-colored rat (*Nesokia bandicota*) of southern India and Ceylon, where it is known as the "pig-rat" on account of the taste of its flesh, which is a favorite article of food among the natives of the

BANDIERA — BANFFSHIRE

dry, hilly districts it frequents. As its food is chiefly grain and roots it does much harm to gardens; and it is also destructive to poultry. It has the habit of storing rice in its underground nests against the famine of the dry season.

2. In Australia, a small marsupial with a long, narrow head and muzzle belonging to the family *Peramchidæ*. Many species are scattered throughout Australasia. They live in warm nests underground, and feed upon insects, worms, and vegetable food. The hare-like marsupials of the closely allied genus *Perogale* are known as rabbit-bandicoots, and, like the other, frequently injure vegetable gardens. Consult Gould, 'Mammals of Australia' (London 1863).

Bandiera, bân-dî-ă'ra, **Attilio** and **Emilio**, two brothers of a Venetian family, lieutenants in the Austrian navy, who attempted a rising in favor of Italian independence in 1843. The attempt was a failure, and they fled to Corfu; but, misled by false information, they ventured to land in Calabria with 20 companions, believing that their appearance would be the signal for a general insurrection. One of their accomplices had betrayed them, and the party was captured at once by the Neapolitan police. Attilio and Emilio were shot, along with seven of their comrades, in the public square of Cosenza, 25 July 1844.

Bandinelli, bân-dē-nēl'-lē, **Baccio**, Italian sculptor: b. Florence, 1493, the son of a goldsmith; d. 1560. He learned his art under the sculptor Rustici, but modeled his style after that of Michael Angelo, whom he vainly attempted to rival and whom he hated with life-long hatred. He was patronized by the Medici, and in honor of the presence of Leo X in Florence he executed the model of a colossal statue of Hercules which was intended to surpass the David of Michael Angelo. Another work of his was an inferior copy of the Laocoon group for Francis I. He produced also Hercules and Cacus (at Florence), a somewhat heavy work, 88 figures of apostles, prophets, and saints in the choir of the cathedral at Florence, a Bacchus, an Adam and Eve, etc.

Ban'dit (It. *bandito*), originally an exile, banished man, or outlaw; and hence, as persons outlawed frequently adopted the profession of brigand or highwayman, the word came to be synonymous with brigand. Of all European countries Italy has perhaps been most infested with banditti. They used to form a kind of society of themselves, subjected to strict laws, and living in open or secret war with the civil authorities. Peter the Calabrian, the most terrible among these robbers, in 1812 named himself, in imitation of the titles of Napoleon, "emperor of the mountains," "king of the woods," "protector of the conscribed," and "mediator of the highways from Florence to Naples." The government of Ferdinand I. was compelled to make a compact with this bandit. One of the robbers entered the royal service as a captain in 1818 and engaged to take captive his former comrades. Subsequently adventurers of all kinds united with them. The Austrian troops which occupied Naples were obliged to send large detachments to repress them. The bandits used to exact from strangers and natives a sum of money for protection, and give them in return a letter of

security. In Sicily the Prince of Villa Franca declared himself, from political and other views, the protector of bandits; he gave them a livery and treated them with much confidence, which they never abused. Banditti are still active in Italy, Sicily, Turkey, and elsewhere.

Bandolier', a large leathern belt or bald-ric, to which were attached a bag for balls and a number of pipes or cases of wood or metal covered with leather, each containing a charge of gunpowder. It was worn by ancient musketeers, and hung from the left shoulder under the right arm with the ball bag at the lower extremity, and the pipes suspended on either side. The name is now given to a similar belt by which a number of cartridges are conveniently carried.

Ban'don, or **Bandonbridge**, Ireland, a town on the Bandon, 20 miles southwest of Cork. It is well built, but has no edifice of special note. Distilling, brewing, flour-mills, etc., are carried on. Pop. about 4,000.

Bandon, a river of Ireland which rises in the Carberry Mountains, and at its mouth forms the harbor of Kinsale. Spenser describes it as "the pleasant Bandon, crowned by many a wood." It has a course of 40 miles, for 15 of which it is navigable to Innishannon, four miles below Bandon.

Bandong, bân'dông, or **Bandung**, a flourishing commercial town in the centre of the western end of Java, in the vicinity of the volcano Gunong Guntour. Since 1864 it has been the capital of a province known as the Preanger Regencies.

Bandtke, bant-kē, or **Bandtkie**, **Jerzy Samuel**, Polish historian: b. Lublin, 24 Nov. 1768; d. Cracow, 11 June 1835. He was author of 'History of the Polish Nation' (1820), and professor in the University of Cracow, 1811-35.

Bane'berry. See *ACTÆA*.

Banèr, ba-nār', **Johan Gustafsson**, Swedish general in the Thirty Years' war: b. 1596; d. 1641. He made his first campaigns in Poland and Russia, and accompanied Gustavus Adolphus, who held him in high esteem, to Germany. After the death of Gustavus in 1632 he had the chief command of the Swedish army, and in 1634 invaded Bohemia, defeated the Saxons at Wittstock, 24 Sept. 1636, and took Torgau. He ravaged Saxony again in 1639, gained another victory at Chemnitz, and in 1640 defeated Piccolomini. In January 1641 he very nearly took Ratisbon by surprise.

Banff, bânf, Canada, a pleasure and health resort in Alberta, on the Canadian P. Ry. There are sulphur springs, fine hotels, and all the requirements of a mountain resort. The permanent population of the village is less than 300, but during the season the region is full of visitors.

Banffshire, Scotland, a county in the north, bounded on the north by the Moray Firth, on the west by the county of Moray and part of Inverness, on the south and east by the county of Aberdeen. The soil is for the most part a rich loam or deep clay. The principal rivers are the Spey and Deveron, with the Isla, a tributary of the former, and the Avon and Fiddich of the latter; besides which there are many other main and tributary streams. The

BANG — BANGKOK

mountains rise in altitude as they recede from the sea, the most celebrated being Cairngorm, which is 4,095 feet high. The principal crops are barley, oats, turnips, and potatoes, little wheat being raised. Special attention is paid to the cultivation of turnips, the chief object of the farmer being the rearing and feeding of cattle. The total area of Banffshire is 410,000 acres. Nearly two fifths of the total surface is under cultivation, and about one fifth is occupied by woods and plantations. Since about the middle of the 19th century large tracts of formerly waste land have been reclaimed. Fishing is a staple industry. The salmon caught in the Spey and Deveron constitute an important article of traffic, the valued rental of the Duke of Richmond's salmon fishings in the former being over \$60,000 a year. Banffshire possesses several woolen factories, tanneries, rope and sail works, ship-building yards, breweries, lime-works, and many distilleries, the whiskey being generally known under the name of Glenlivet, after a glen in the county. Among the natural productions limestone is the most prevalent. Serpentine also abounds in several places, especially at Portsoy, where it is known as "Portsoy marble"; it is wrought into vases and other ornaments. Ironstone and manganese also occur, and Scotch topazes or cairngorm stones are found on the mountains in the south of the county. Pop. (1901) 61,439.

Bang, bång, Hermann Joachim, Danish novelist: b. 1857. He came into notice about 1879, since which time he has published a number of novels and some poems. 'Hopeless Generations' (Haablose Slægter); 'Eccentric Tales' (Excentriske Noveller); 'Under the Yoke' (Under Aaget); 'Ten Years' (Ti Aar); and 'By the Roadside' (Ved Veien), are the titles of some of them. The last named is considered the masterpiece.

Bang, a drink. See BANGUE.

Bangalore, bân-gā-lôr', a town of Hindustan, capital of Mysore, 70 miles northeast of Seringapatam. It stands on a plateau 3,000 feet above sea-level, and is divided into two parts, the old native town and the cantonments. The chief buildings are the government house (where the British resident lives), the new public offices, the palace of the maharajah, the central jail, etc. There is a fine public pleasure-garden. In the old town stands the fort, reconstructed by Hyder Ali in 1761, and captured by Lord Cornwallis in 1791. Latterly the town has greatly prospered. There are manufactures of silks, cotton cloth, carpets, etc. Bangalore is noted for its salubrity. Pop. (1901) about 160,000.

Bange, bânzh, Valerand de, French artillery colonel: b. Balignicourt, 1833. In 1873 he reconstructed both the light and heavy field pieces of the day, and his models were adopted by the French army in 1879. In 1884 he was the successful competitor with Krupp for the contract to supply field pieces to the Servian government. His gun has been preferred also by England, Sweden, and Italy. He was the first to employ effectively the screw principle in the mechanism of the breech block. See Hennébert, 'L'Artillerie Krupp et l'Artillerie de Bange' (1886).

Bangkok', or Bankok, the capital of the kingdom of Siam, extending for 3 or 4 miles

on both sides of the Menam, which falls into the Gulf of Siam about 15 miles below. It consists of three parts—the town proper, the floating town, and the royal palace. The town proper occupies an island 7 or 8 miles in circuit, and is surrounded with walls and bastions; situated in the midst of gardens and luxuriant foliage it presents a very picturesque appearance. The floating town consists of wooden houses erected on bamboo rafts moored to the bank in rows eight or more deep. The palace, occupying an island in the river, is surrounded by high walls. Though the general character of the buildings is not imposing, numerous temples, glittering with gilding and terminating in lofty spires, are seen in many quarters. The trade, both inland and foreign, is very extensive. The population is about 800,000, nearly half of whom are Chinese, the others including Burmese, Annamese, Cambodians, Malays, Eurasians, and Europeans. The foreign trade of Siam centres in Bangkok and is mainly in the hands of the Europeans and Chinese. The approach to Bangkok by the Menam, which can be navigated by ships of 350 tons' burden (large sea-going ships anchor at Paknam, below the bar at the mouth of the river), is exceedingly beautiful. As the town is neared, numerous temples present themselves, and floating houses become common; and finally the whole city, with its rich gardens and shining temples and palaces, bursts full upon the view. Stone buildings are used only for the royal palaces, some noblemen's houses, monasteries, and the dwellings of Europeans. A large number of the houses float on rafts fastened by ropes to poles; most of the trade of the city is carried on upon the river. The internal traffic of Bangkok is chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen, except in the neighborhood of the palaces. The native houses on land,—of bamboo or other wood, like the floating houses,—are raised upon piles, six or eight feet from the ground, and are reached by ladders. The circumference of the walls of Bangkok, which are 15 to 30 feet high and 12 broad, is about 6 miles. Bangkok is the constant residence of the king. The palace is surrounded by high walls and is nearly a mile in circumference. It includes temples, public offices, accommodation for officials and for some thousand soldiers, with their necessary equipments, a theatre, apartments for a crowd of female attendants, and several Buddhist temples or chapels. Several of the famous white elephants are kept in the courtyard of the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The temples of Bangkok are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. In the neighborhood of Bangkok are iron mines and forests of teakwood. The chief exports are rice, sugar, pepper, cardamoms, sesame, hides, fine woods, ivory, feathers, and edible birds' nests. The imports are tea, manufactured silks, and piece goods, opium, hardware, machinery, and glass-ware. The United States has a resident consular agent. Among recent evidences of progress may be mentioned the erection of steam mills, the introduction of gas into the royal palaces and many noblemen's houses, and the estab-

BANGOR

lishment of a regular mail to Bangkok in 1884. Siam joined the International Postal Union in 1885, and in 1890 a parcel post service (with Singapore and Europe) was established. Bangkok is now connected with Burma and Cambodia by telegraph, and is the centre of a local system of (in 1893) 1,780 miles. A short railway at Paknam (on the coast) was opened in 1893; another line of 165 miles is being made; and others to the northern provinces have been surveyed and sanctioned. In 1893 a treaty was concluded at Bangkok, by which Siam made large cessions to France, two French gunboats having forced their way to the capital after an ineffective defense.

Ban'gor, Ireland, a seaport town, county Down, situated on an acclivity on the south side of Belfast Lough, four miles northwest of Donaghadee. It consists of three principal and several smaller streets, and has an Episcopal church, a Methodist and a Roman Catholic chapel, and two Presbyterian churches; an endowed school, six national schools, a Protestant hall, and a branch of the Belfast Bank. The male population is chiefly employed in seafaring pursuits, the females in hand-sewing in all its branches. Bangor is a favorite bathing resort. Bangor Abbey was founded by Saint Congall in 555 A.D., and was destroyed by the Danes in the 9th century. The parish church now occupies the site. Pop. in 1891, 3,834.

Bangor, Maine, the chief city of eastern Maine, is a port of entry and the seat of Penobscot County. The city is on the west bank of the Penobscot River, across its affluent the Kenduskeag, and at the head of navigation, about 28 miles from Penobscot Bay. It is on the Maine Central, Bangor & Aroostook and several other railroads, with steam and electric lines radiating in all directions; is on the main line from Boston to Saint John and Halifax, and also has direct steamship connection with Boston, being the terminus of the Bangor Division of the Eastern Steamship Company. Bangor is 76 miles northeast of Augusta, 137 miles northeast of Portland and 246 miles from Boston.

Trade and Commerce.—Situated near the geographical centre of Maine and at the head of navigation on the largest river of the State, Bangor occupies a highly favored position and one destined to be even more commanding with the growth and development of the expansive territory north and east and tributary to her. As the shire town of a county embracing some 75,000 inhabitants, as the trade centre and shipping point of a large and rich agricultural section and for many thriving industrial communities; as a point of convergence for numerous important railway and steamship lines, and a consequent tarrying place for great numbers of tourists, sportsmen and commercial travelers; these together with the busy commerce of its port, the metropolitan character of its hotels and the compactness of its business section, give to the city a much more populous appearance than the above figures would indicate. Bangor has a fine harbor, easily accessible for vessels of large size; and the scene in the open season along the docks, where crafts of varying rig are loaded with lumber, ice and the diversified products of this region, is an animated one. Although nearly 30 miles from the bay and 60 miles from the ocean, the tide rises about 17

feet, and there is a sufficient depth of water to float the largest of ocean steamships. The Penobscot River, whose waters unite with those of the bay of the same name, is a noble water highway, rising 300 miles away amid the mountains and forests of northwestern Maine. In the 8,200 square miles drained by the Penobscot there are 1,604 tributary streams indicated on the State map, and 467 lakes and ponds. Bangor is one of the greatest lumber markets in the north, there being tributary to the city the great forests of spruce traversed by the Penobscot and down which the logs are floated; and has every sort of manufactory of wood and allied products,—saw, planing, woodpulp, and molding mills; factories of furniture, carriages, trunks, valises, agricultural implements, boots, shoes and moccasins, clothing, dairy products, etc., with iron foundries, machine shops, shipyards, flour mills and pork-packing establishments. Ice-cutting is also an important industry, Penobscot ice being exceptionally pure.

Manufactures and Industries.—Bangor's manufacturing establishments number in the vicinity of three hundred, embracing about one hundred different kinds of industries and employing several thousand hands. These figures are, however, inadequate to correctly portray the city's manufacturing interests, as many of the most important establishments, including all the large saw mills but one, are outside the city's limits. Therefore, while the manufactures of these mills are purely Bangor products, the plants themselves and most of the employees belong properly to other towns. Among Maine's many industries the lumber trade still holds a foremost place. From 1816, in which year about a million feet were cut, down to the present time, there have been cut on the Penobscot waters in the vicinity of 11,000,000,000 feet. The lumber cut on the Penobscot and its tributaries during the winter of 1903-4 aggregated about 210,000,000 feet. Lumber shipments from the port of Bangor during 1903 were 156,509,108 feet against 124,767,646 feet in 1902, and 120,954,897 feet in 1901. In recent years pulp and paper manufacturing has made great advance and numerous pulp and paper mills are now in operation along the Penobscot, from those of the Eastern Manufacturing Company at South Brewer to the immense plant of the Great Northern Paper Company at Millinocket.

In recent years diversified manufactures have been multiplying and many and varied are the products of these establishments. Bangor has one of the largest and most prosperous shoe factories in the State. Here is located a trunk manufacturing establishment which shipped recently a whole trainload of trunks, the largest shipment of trunks ever made by one manufacturer in this country or the world. There are located here great wood-working plants from whence go all over the country the finest designs in interior decorations and architectural wood-working.

Bangor is a trade centre for eight counties, and is connected with their principal places by steam or electric roads, or by water communication. As indicative of the volume of the city's commerce the Bangor Customs District reports the exports for the fiscal year ending 30 June 1903 as \$5,372,939, against \$4,248,430 in 1902, and \$4,170,982 in 1901. The imports for the fiscal

BANGOR

year ending 30 June 1903 were \$1,341,880. In 1903 for the first time in its history the United States Bureau of Statistics reports a shipment to the Midway Islands, located in the distant Pacific, midway between Honolulu and Guam, and it is interesting to note that these goods were shipped from the Bangor Customs District. Exports by vessel from the port of Bangor consist chiefly of fruit box shooks to the Mediterranean, spool bars to Scotland and deals to South America and the United Kingdom. The coal receipts in the port of Bangor aggregated 305,720 tons in 1903 and there were 273 cargoes.

Banks, etc.—Bangor has five national banks, two savings banks, two trust and banking companies, two loan and building associations and two marine insurance companies. There are two daily papers and several weekly and monthly publications. There is a board of trade with attractive rooms at the city hall. The Kenduskeag, flowing through the centre of the city, is spanned by several bridges, and the city is connected with Brewer across the Penobscot by a bridge 1,300 feet long. A dam across the Penobscot just above the city furnishes water supply and power, the city owning both its waterworks and municipal lighting plant. The assessed property valuation of Bangor is \$16,345,000, with a total debt of less than \$1,000,000.

Buildings, etc.—The city has a fine granite custom house and post-office and the recently completed county court-house is a handsome and commodious edifice, a credit to the great county of Penobscot, of which Bangor is the shire town. Bangor's city hall—the Hersey memorial building—is an imposing edifice which reflects credit upon the city. The Bangor public library is one of the foremost institutions of its kind and contains on its shelves upwards of 50,000 volumes. The Bangor opera house is unsurpassed for its beauty and appointments by any outside the largest cities. The Bangor Auditorium Association has erected the largest building of its kind in the State, and here each fall are held the eastern Maine musical festivals. The Eastern Maine General Hospital is one of the important institutions here and Bangor is also the home of the Eastern Maine Insane Hospital. The Bangor Theological Seminary is a time-honored institution of learning, and only nine miles away, in the town of Orono, is the flourishing University of Maine.

Government.—Bangor received a city charter 12 Feb. 1834. The city seal is typical, the rising sun in the background illustrating the Sunrise State, and the spruce tree in the centre portraying the great lumber interests, while in the immediate foreground are gear wheel, anchor and plow, emblematic of manufactures, commerce and agriculture. The government is vested in a mayor, who is elected annually, and a council divided into two chambers. The city has seven wards, and one alderman and three councilmen are chosen annually from each ward, the city government comprising the mayor, seven aldermen and twenty-one councilmen. Most of the appointments and administration offices are subject to the control of the mayor and city council.

History.—Bangor's present site was in the early days the camping-ground of the Tarratines, a famous tribe of Indians. It was in 1769

that Jacob Buswell, Bangor's first white settler, came here from Massachusetts. He was a hunter and boatbuilder, and established his home near the site of Saint John's Roman Catholic Church. The place was for a time known as Kadesquit, afterwards as Condeskeag, and later as Kenduskeag. The locality had been visited by the French as early as 1605, and was one of the many places identified with the mythical Norumbega. Kenduskeag plantation was only a small hamlet at the time of the Revolution and during the time when the British had control of the river the hardships were severe. At the instigation of Rev. Seth Noble, Bangor's first clergyman, the name of Kenduskeag was finally abandoned and Sunbury adopted. With the growth of the place the people became impatient of the plantation organization and delegated Parson Noble to proceed to the General Court at Boston and secure an act of incorporation. Minister Noble was a great lover of music, and the hymn tune of Bangor was such a favorite with him that that name was substituted for Sunbury and the act incorporating the town of Bangor was passed 25 Feb. 1791.

Bangor early gave attention to the matter of improving her transportation facilities, and she had her railroad when most of the proud cities of to-day knew nothing of such things. As early as 1836 her enterprising citizens built a railroad to Old Town, a dozen miles up the river, with a view of aiding the development of her natural resources; and this, one of the earliest railroads in America, prospered for nearly a third of a century. Not only did the city have one of the first railroads in the country, but the pioneer iron steamship constructed in America was built to run to this port and bore the name Bangor. She was built in 1845 on the Delaware, her owners being the Bangor Steam Navigation Company of Maine, and she was designed for passenger and freight service between Boston and Bangor. Within recent years, through the enterprise of some of Bangor's public spirited men, Aroostook County has been brought into direct railroad communication with Bangor through the construction of the Bangor & Aroostook railroad, this system having numerous branches to important points in northern Maine, it having also absorbed the Bangor & Piscataquis railroad. In recent years there has been no more important railroad enterprise inaugurated in New England than that of the Bangor & Aroostook, and under its enterprising and progressive management it has become a potential factor in the development of Bangor and the immense territory stretching to the northward. Bangor business men, ever alert to adopt the newest methods, inaugurated in this city the first electric railroad in Maine and more recently electric roads have been constructed reaching Hampden and South Brewer on the south and Old Town and Charleston on the north. These electric lines bring Bangor and the territory immediately contiguous into close touch, and the benefits accruing therefrom are far-reaching.

Located as the city is, on the west bank of the imperial Penobscot, at its junction with the less pretentious Kenduskeag, the business is largely in the valley, while the surrounding heights afford picturesque sites for residences. The diversified aspect is heightened by the

BANGOR—BANGS

wealth of trees along the residential streets, and few localities are to be found with greater scenic attractions. From the highlands overlooking the city the view is particularly fine, the mountains which fill the eastern horizon making a fitting background to the picture. The Kenduskeag has, through much of its course, very precipitous banks, a notable illustration being the historic Lover's Leap, a mile above the city; and along this picturesque stream are innumerable gems of scenic beauty.

Bangor enjoys the unique distinction of being the only place of its size on the globe where salmon fly-fishing can be successfully practised within the city's limits, and in one season a Bangor lumber manufacturer brought to the gaff and successfully landed twenty-seven salmon, aggregating 500 pounds in weight. The Bangor salmon pool, whence are taken all the salmon caught with a fly on the Penobscot, is situated about a mile above the city and just below the falls that span the river at the Bangor waterworks dam.

Bangor is the home of many sportsmen and is the headquarters in this section for sportsmen's supplies of all descriptions. Nearly all the parties of sportsmen who in the season visit the great wilderness of northern and eastern Maine make this their rendezvous and procure their outfits here. Moose and deer are multiplying rapidly as the result of wise game laws, and Maine is truly the sportsmen's paradise. The records kept by the wardens at Bangor show that during the fall months of 1903 there were shipped to and through the city from the Maine game regions 4,679 deer, 217 moose and 26 bears, the biggest shipment in a single day having been 202 deer and 14 moose.

Population.—In the year 1800 the population of Bangor was 277. From 1830 to 1834 Bangor expanded rapidly and when in the latter year a city charter was adopted the population was about 8,000. The census for 1900 gave Bangor a population of 21,850; the population in 1904 is about 25,000, and with the towns immediately environing, including the city of Brewer across the river, about 40,000.

EDWARD M BLANDING,
Secretary Bangor Board of Trade
